ular disease, usually occurring on the teats and udder, sometimes on the muzzle and mucous membrane of the mouth and nose. It may occur in isolated instances, sometimes affecting one or only a few of the herd; at other times it may attack the whole herd. Its origin among cattle has been the subject of much dispute, some claiming that it always occurs spontaneously, citing as examples those isolated cases not infrequently met with, while others claim with equal positiveness that before an animal can have the disease it must contract it from some other source. The latter contention is more probable, as there is no instance of an analogy to the former existing in other infectious diseases. The contagion, therefore, must be transmitted in some manner to the animal, and its source must be either an animal or man having this disease. No other conclusion seems possible. It sometimes is met with occurring in horses, and is known as the "grease." Jenner demonstrated that the "horse grease" and cowpox were one and the same malady, and that matter taken from the horse could be transmitted to the cow, causing an inflammation and symptoms identical with cowpox, and moreover, protecting equally as well against smallpox as does vaccinia. Bouley of Alfort has also made a study of the "grease" disease of horses, together with cowpox, and concludes that they are one and the same disease. In further support of the theory that the disease is transmitted to the bovine species largely through human agencies, it is a well-known fact that it is more frequently met with among milch cows than in either the heifers or males of the same herd. The reason for this is that the cowpox virus is transferred from cow to cow by means of the milkers' hands. The prevalence of cowpox appears to be in some way influenced by the seasons, more cases having been reported occurring during the spring months than at other times of the year. Suckling calves are also quite susceptible. It cannot be said, however, that vaccinia affects only cows, or the young calf, as all animals of the bovine species can be readily inoculated with the virus and the lesions caused by such inoculations are identical with those occurring "spontaneously." Jenner supplied many countries in his time with vaccine virus, originally from the cow, and subsequently propagated from arm to arm. The American stock of vaccine virus was introduced into the United States in either 1803 or 1804 by Waterhouse in Boston, and Hosack in New York, and at the same time in the Southern States through the interest of President Jefferson. Some of these strains were propagated for a long time by the arm to arm method. In Europe a strain of the original, received from Jenner in 1802, was still being propagated at Vienna as late as the eighties. The celebrated Beauagency stock, originating from a "spontaneous" case of cowpox in 1864, has furnished many strains. This was largely employed in France, Belgium, Germany, and England, and was introduced in the United States in 1870 by Dr. Martin of Boston, just before the original was lost, during the siege of Paris. It is not known whether this particular strain is in existence at the present time. Many strains became so attenuated that they failed to cause the typical lesions and characteristic symptoms of vaccinia, and, most important of all, their protective property was very slight, if it existed at

VACCINATION

all. The result of employing such virus during what may be termed a pandemic prevalence of smallpox was that many persons who had been previously inoculated with it contracted smallpox. This made it necessary to abandon these weak strains for others of greater strength. Such experiences are not uncommon in the history of the vaccine virus, even as far back as Jenner's time. Jenner emphasized this point of the attenuation of the virus, and regarded it necessary to renew the strain from cases of cowpox wherever possible. Retro-vaccination, or inoculation of the cow with human virus, was often resorted to for the purpose of reviving the strain. The number of cases of natural cowpox have become exceedingly rare during the last half of the past century, only a few instances being reported from year to year, whereas in Jenner's time the disease was very prevalent. The fewness of the cases may be accounted for by the rarity of cases of smallpox at the present time, as compared with those of the past.

The inconvenience, as well as the disappointing results, following the use of humanized vaccine virus gradually resulted in the adoption of another method of propagating and furnishing the virus. One very prominent reason for this was the increasing fear of transferring a certain infectious disease from person to person through vaccination. Also, in transferring tuberculosis, Villeman's experiments regarding the possibility of such danger was given perhaps too much prominence. It cannot be denied that there is some slight possibility of the disease being transmitted in the process of vaccination. Unfortunately, there are cases on record where a grave constitutional disorder has been inoculated into healthy persons by vaccination. Those opposed to vaccination seized upon these accidents, and exploited them in every way possible, as a further argument against the control of smallpox by the arm to arm method, and was not an unimportant factor in reviving the method of propagating vaccine virus on the bovine species. This method was known to many, and was employed as early as 1800 in France, and by several physicians in Italy at various times between 1805 and 1840—the latter by Negri in Naples, who began the systematic use of bovine vaccine virus. It then was employed to a slight extent in several places in Europe, but did not become of general use until many years later. Arm to arm vaccination was the method employed in the United States from the time of its introduction until as late as 1869, when animal vaccine virus began to be employed. It was not so difficult in our large cities to have available a supply of humanized vaccine virus, but with the growth and increase of the rural population it was not always an easy matter to have this supply; so in order to meet this growing demand, bovine vaccine virus was suggested as being the most practical method overcoming the difficulty. This led to the establishment of "vaccine farms," as they were designated, in several parts of the United States. It was not long after their establishment until the bulk of the vaccinations were performed with the bovine virus, and the arm to arm method became the exception to the rule. When calf lymph came into common use, the same difficulties were apprehended with regard to its attenuation as were before noted with the humanized virus. Some observers claimed to have noted the good

effect of restoring a virus beginning to show attenuation, by retro-vaccination—that is, by vaccinating the calf with the humanized virus. The Bavarian government, as early as 1837, made it mandatory that this procedure should regularly be employed for revivifying and maintaining the potency of the vaccine virus. This brings us to consider the efficiency of the virus propagated through the bovine species, as compared with the humanized virus. There are many even to-day who contend that the results following the use of bovine virus are not so good nor so typical as those of the humanized virus. The reaction following the bovine virus is milder, the sore not so large nor typical. If we are allowed to form an opinion, from the descriptions of the early writers and their drawings of the vaccine lesions, it must be admitted that they bear out to some degree the statements regarding what is now observed, and what used to be. Following its application, nearly every civilized country has adopted and employed the bovine virus. In some, vaccination is optional, while in others it is compulsory. Where vaccination is more largely employed, the frequency of attacks of smallpox diminishes in an equal ratio. Germany may be cited as an example, as a country which has employed the bovine vaccine to the greater number of its population than any other country. Vaccination is made compulsory. All children during their first year are required to be vaccinated, and again at the age of 12. All males subject to military service are vaccinated on being drafted in the army (some 300,000 yearly). The official records for 1896 show that 1,518,793 were legally liable to vaccination; 1,321,348 were vaccinated with bovine vaccine virus; and 5,406 were vaccinated with virus of other sources. In primary vaccinations 96.77 per cent were successful. In secondary vaccination, made at the 12th year, there were 1,143,947 legally liable. Of these 1,107,025 were vaccinated with bovine virus and 7,165 with other virus; 91.71 per cent were successful. The wonderful immunity of the German nation to smallpox, resting entirely on its compulsory vaccination laws enacted in 1870, whereby the whole population has been vaccinated and re-vaccinated, not only demonstrates the benefits of vaccination *per se*, but also the efficacy of a virus obtained from the bovine species. Similar cases could also be cited to show the efficacy of the bovine virus. It cannot be said that the immunity conferred by it is any stronger or more lasting than that of the humanized virus, but it has all the advantages and none of the disqualifications which attend the arm to arm vaccination.

From Jenner's time until now there has been a strong belief that there was an intimate connection between vaccinia and smallpox, and that the former was in all probability a modified or attenuated state of the latter. Gassons inoculated 10 cows with matter taken from smallpox cases, and was successful in one instance. After 10 removes the pustule resembled that of a natural vaccine vesicle. These experiments were repeated many times during the past century with more or less success. The most important of them were by Theile of Kasan, Russia (1839), who succeeded in transferring smallpox virus to a cow, and after several removes vaccinated a large number of persons with such virus, the results being in every way the same as observed

VACCINATION

in the cowpox virus. Ceely, in 1839, and Badcock, of England (1840), also succeeded in variolating a cow, and obtained the same results as did Theile. Some of this virus (crusts) was sent by him to this country in 1852, to Coale of Boston, Mass. This was used quite extensively in and around Boston with evidently good results. The Lyons commission, with Chaveau as its chairman, also made an extensive inquiry into the nature of vaccinia and smallpox. Some of its experiments were in this particular direction. Chaveau's conclusions were that vaccinia was separate and distinct from smallpox, and although the smallpox virus could with great difficulty be transferred to the bovine species, producing lesions closely resembling those of vaccinia, on subsequent passages through other animals it became attenuated and finally inert. Voigt, of Hamburg, in 1881, also succeeded in transmitting the smallpox virus to a calf, and after several passages employed it for vaccinating persons. This particular strain has been employed by Voigt for all the vaccinations performed in Hamburg from 1881 to 1904, the virus being propagated directly from calf to calf, with an exception that on two occasions (1891) it was passed from calf to man, and then in 1902 from calf to rabbit. The results obtained from the employment of this strain are such as to be convincing proof of its potency during all these years, as the percentages of successful vaccinations in primary cases, ranging from 98 to 100 per cent, and the low percentage of successes in re-vaccination, 69 per cent, demonstrate the permanency of immunity. The most convincing proof lies, however, in the fact that the population of Hamburg shows fewer cases of smallpox than any other community of same size. The preponderance of evidence accumulated during the past century shows that vaccinia is nothing more or less than a modified and attenuated form of smallpox. The latest researches on this subject, as set forth at length by Pfeiffer, Guarnieri, and Wasielewski, and of those in particular by Councilman and his co-workers on the specific organism of smallpox and vaccinia, seem to leave but little doubt as to their common nature. About the end of the 19th century the value of re-vaccination was becoming better understood, but it required many years before this important fact was appreciated. Even now it is ignored to a considerable extent in some parts of the world, particularly in the United States.

Vaccinia has never been observed to occur spontaneously in man. It is always transmitted by inoculation. The appearance of the inoculated lesion varies somewhat, according to the manner in which the virus is inserted. The usual methods are: (1) By puncture. (2) By scarification or denudation of the epithelium (abrasion). (3) Hypodermically. If by puncture, a slight redness occurs at the point of inoculation within 24 hours, not different from any slight wound of the skin. In 48 hours a slight redness may be seen around the puncture, which to the touch may give a sensation of a slight elevation of the spot. At 72 hours the spot is visible, slightly elevated, slightly gray in the centre and surrounded with the faintest suggestion of a pink border or areola. In 96 hours the papule is of a dull whitish color, the border elevated and well outlined. There is usually a depression of the centre — umbilicated, the areola

is well marked; the skin around it is hard, and begins to be painful and itch. From the fifth to the sixth day the process still further enlarges and varies from one fourth inch to one half inch in diameter. The centre is darker and more depressed, the periphery much more elevated, and the edges of a pearly gray color. The sore is filled with a fluid, the areola is of a darker color, the skin just beyond this is softer and less painful. About the seventh day the vesicle becomes flatter, though somewhat wider, the centre not so much depressed but covered with a crust or scab. The gray zone becomes yellowish, and the areola and induration diminished. From this time onward the process gradually subsides, the crust or scale becomes thicker and more elevated, gradually contracts, and after 15 or 18 days falls off and leaves a completely healed pink and glistening surface, with small dark depressions here and there over its area. If the inoculation is made by scarification or incision the same phenomena are observed, save that the process is hastened and is fairly well marked on the second day, with incipient but distinct areola; the central depression, with a distinct gray, pearly margin, elevated and prominent. The areola and induration are well marked on the fourth day, the gray centre is vesicular and transparent, its external margin irregular; the central depression is quite marked, the areola a bright pink, and the surrounding skin is swollen. The lesion now advances more rapidly during the next 24 hours, when the clear vesicular zone becomes a whitish color, its borders irregular, the central depression darker and covered with a crust. The areola is not now so prominent nor the induration so diffused. It has now reached its maximum development and gradually subsides, healing from the fifteenth to the eighteenth day. When the virus is inserted by the hypodermic method, and the needle passed into the skin, the appearance of the lesion is much the same as in that by simple puncture, but sometimes there is no lesion development of the skin proper. Instead there is a slight induration beneath it, which to the touch imparts a feeling of a small shot. This gradually enlarges until the fifth or sixth day, when it soon subsides. The constitutional symptoms in man are practically the same as those occurring in the animal. There is an elevation of temperature, loss of appetite, and thirst, and more or less enlargement of the glands nearest to the lesion, which reaches its greatest at the height of the development of the pustule. If there is no secondary infection of the lesion by extraneous bacteria the temperature falls to normal, the sore heals, and all symptoms rapidly subside. In some very susceptible subjects, particularly in children, vaccination is sometimes followed by a secondary vaccinal eruption. This may be a discreet crop of vesicles occurring at or around the point of inoculation. Sometimes, however, a general eruption may follow. This second crop will go through practically the same phases of development as does the original puncture, only that it is smaller and the individual vesicles have not the same amount of areola and induration of skin as observed at the site of inoculation. The local lesions of inoculated smallpox and vaccinia are quite distinct. So also are the constitutional symptoms. In smallpox there is a period of from 12 to 14 days intervening between the exposure to the disease and the appearance of the first

VACCINATION

symptoms. In inoculated smallpox the period of incubation is much shorter, 7 to 8 days, before the fever and rash. In vaccinia the incubative period is from 5 to 6 days. The differences between each can be illustrated in the following temperature chart (after Hime):

immunity following an attack of smallpox. The time when the tissues become refractory to the vaccinal process has been established by observation both on man and animals. If an animal be vaccinated over a small spot of the skin in successive days, the vaccinated process will de-

Recovery from smallpox requires from 30 to 40 days or more; if inoculated, smallpox, 25 days, and for vaccinia, 22 days. The limit given for each is for the time required for the individual to completely recover from the disease. Does recovery mean simply that the infective agent has completed the cycle of its development, and then ceases to exist, or that it is influenced or brought under subjection to certain substances in the body of the host? It is a well-established fact that recovery from any attack of smallpox usually protects the individual against a subsequent attack. So also does vaccination protect against subsequent inoculation, and also protects against smallpox. There is beyond question a change occurring in the body in some way, which prevents it again becoming a susceptible reagent to these poisons, a state of resistance or immunity. Some experiments of Sternberg show that the blood of a vaccinated calf, when mixed with a quantity of vaccine virus, destroys its activity. The writer has also observed this. It was found that these substances begin to make their appearance in the blood of a vaccinated animal about the ninth day, and are at the height of their potency at about the 14th day, after which they gradually disappear. Even when these substances (antibodies) have disappeared, the animal will remain for a long time refractory to vaccination. It, therefore, seems more than probable that two states of resistance are brought about by vaccinia, one in which the vaccine virus is destroyed by these new substances, and that the body cells have in some manner been so modified that they are no longer in a receptive state to the virus. The same train of reasoning would seem to apply to the state of

velop normally on the first, second, third, fourth, fifth, and sixth days; that on the seventh day will show an under development; the eighth day still more so, and the ninth only a slight trace, if any, and that of the tenth day not at all. The immunity is established about the ninth day, and will continue for a period more or less long, and sometimes is permanent. Jenner has demonstrated that immunity to both smallpox and vaccinia is very strong, as persons having previously had the cowpox, even years before and subsequently vaccinated with fresh vaccine virus, and even inoculated with smallpox, did not contract the disease. The same also was established in Jesty's cases who were inoculated with smallpox virus without result a number of years after vaccination. Immunity to vaccinia can be produced in several ways. We have heretofore dealt with the method of inoculating the skin of mucous membrane and cornea with vaccine. The Lyons Commission, in 1877, demonstrated that a calf or horse could be rendered immune to vaccinia by injecting the virus either subcutaneously or intravenously, and after 9 to 14 days the animal would be refractory to a subsequent inoculation. Several years ago the writer made some experiments regarding this immunity, when conducting an inquiry into the serum therapy for smallpox, in which he confirmed all that had been claimed by the Lyons Commission, Chaveau, and others. Not only was immunity established by intravenous and subcutaneous injections of the vaccine virus, but also a rapid immunity could be induced by injecting the virus under dura mater, or into the brain substance. Monkeys could thus be rendered refractory to vaccinia within five

VACCINATION

days, whereas it could be caused in nine days when the virus was administered intravenously, or by inoculating the skin. It requires a very minute quantity of the virus, either in the form of lymph or pulp, to cause the typical lesion. Chaveau found that by taking lymph from a vaccine vesicle and diluting it as much as 1-20000th, it would cause a typical vaccine lesion. A general vaccinal eruption sometimes occurs in calves and young horses (colts) when a considerable amount of vaccine virus is injected in the veins, the eruption making its appearance about the fifth day, shortly after the fever. The eruption appears to be nowise different in appearance than that artificially produced by minute punctures. It also resembles the secondary eruption which occasionally follows vaccination in children. Vaccinia is chiefly confined to the tissues of the skin, but coincident to the development of the specific eruption the virus can also be demonstrated in the blood and the lymphatic glands, particularly those located near the point of inoculation. The blood, however, does not contain a very great amount of the virus, as it requires a considerable quantity, as much as 500 c.c. (half a litre) to be inoculated applied to a scarified skin before it will cause a vaccine lesion. It has also been demonstrated to be present in the lymphatic glands, but it is not constant. The specific agent is to be found in these tissues only during the febrile state. Immunity can be conferred on other animals by transfusion of the blood during the febrile stage, provided a large quantity be given.

Cause of Vaccinia.—Since the discovery of the disease many observations have been made from time to time on vaccinia, with a view of determining its specific cause. Nearly all such were made from a bacteriologic standpoint, and numerous investigations have described various bacteria as being specific. Pfeiffer (1889) approached the subject in another way. He noted that smallpox and vaccine lesions contained bodies which, to all appearances, resembled that form of cell-life known as the protozoa (a higher type than the bacteria), and later Guarneri made a more comprehensive study of the lesions. He chose for his field of observation the cornea, where he was better able to observe the various changes occurring in the evolution of the vaccinal lesion, and in the life history of the parasite. He found that soon after the inoculation of the cornea with vaccine virus a certain number of epithelial cells at the point of inoculation began to undergo a change. These cells began to show small round bodies which highly refract the light, lying in the protoplasm of the cell, are surrounded with a clear zone. These bodies are usually spherical and vary in size, some occasionally attaining the size of the nucleus of the cell, while others are minute points. They vary considerably in their shape and appear to be endowed with amoeboid movements. The organism was protoplasmic, having no limiting membrane, nor does it contain a nucleus. The mode of production is by direct division. "The parasite has a circular evolution; it develops from around a central point—concentrically from within outward—hence the lesion of variola and vaccinia is circular" (Guarneri). The announcement of this discovery excited no little interest among those who were devoting their

attention to this subject. Since then much has been added to our knowledge regarding the nature of both smallpox and vaccinia. Guarneri's work has been carefully reviewed by many, among whom that of Wasielewski has been of great service in bringing forward additional proofs, as well as adding no little to our knowledge of the parasite found in vaccinia and smallpox. He demonstrated beyond question that a parasite was always found in the epithelial cells of a vaccine or a smallpox lesion, that these parasites are never found in any other lesion, nor in the healthy tissues. Attempts failed to produce these in the cornea by inoculating it with material from skin scrapings, from measles, scarlet fever, chicken pox, foot and mouth disease, bacteria, or matter from non-specific pustules on the teats and udder of the cow. Nor are such bodies present when irritating substances such like cantharides, croton oil, silver nitrate, glycerin, osmic acid, India ink, or bacteria are applied to the cornea. Further, that if vaccine virus be deprived of its activity by filtration through porcelain, it loses its power to produce these bodies. Limited quantities of vaccine virus have been inoculated in the cornea of a rabbit and passed successfully from one rabbit to another for as many as 130. It would not stand to reason that any quantity of the original would be transferred to the animal last in the series, yet the lesion in the cornea is identical with the first, and the parasites are present in number, and have the same form and location in the cells. The filtration experiments also demonstrate that the bodies are larger than the bacteria, as virus subjected to this process loses its power of producing the vaccinal lesion. It would, therefore, appear that since these bodies are constantly present in the lesions caused either by smallpox or vaccinia, and are not observed in any other disease process, nor caused by physical or chemical agents, that they are actual parasites, and are not simple changes produced in the cells by any other than these bodies. "The 'vaccine' bodies are the only characteristic structures which can be found in the skin mucous membrane in smallpox and vaccinia. They are absent in normal and other pathological conditions of the skin. These vaccine bodies appear with certainty and constant regularity when an actual vaccine virus is applied to a lesion of the skin or cornea."

All persons or animals of a given species do not contract vaccinia alike; some are quite refractory, and others so for the time being, but may be inoculated after repeated trials. In some the vaccinal lesion develops poorly, being small yet typical, and is often delayed in its evolution. Instances like these are not infrequently observed where a group is vaccinated under practically the same conditions. Particularly is this so with animals used for the propagation of the vaccine virus. In those cases where the lesion is undeveloped, typical immunity, however, as a rule follows, and is more or less permanent. It is believed that such immunity is not so great as that following a fully developed lesion. The same insusceptibility to smallpox has also been observed. All persons exposed do not contract the disease, nor do all attacked suffer alike. However, those persons who resist the infection at first, if continuously or repeatedly exposed, will sooner or later succumb. It is a current belief

VACCINATION

that a successful vaccination confers a lasting immunity to smallpox. While a greater proportion of those successfully vaccinated are rendered refractory for a long time, there are some who will at some time or other contract smallpox. Such cases are, however, very rare. The most of them are among persons who have either been vaccinated in their infancy, or in whom vaccinal lesion was atypical. Vaccinated persons who contract smallpox, as a rule, have it mildly, running a shorter course, with none of the usual complications. This modified form is designated as varioloid. Immunity conferred by vaccination does not last as long as that following an attack of smallpox. It was once considered so, particularly during the time when arm to arm vaccination was practised. Jenner himself states that he deemed it advisable to re-vaccinate from time to time, in order to insure a full protection. It cannot be gainsaid that a single inoculation will be followed by a typical lesion, and that this will protect against smallpox, but for just how long it cannot be said. By comparison with the method of making multiple insertions (three or more), the cases of modified smallpox (varioid) occurring among those vaccinated by a single insertion are found to be more frequent than among those vaccinated by multiple insertions. In Sweden the multiple insertion method has been practised for many years; the cases of smallpox are few, re-vaccination is not the rule. It would seem, therefore, that multiple insertions afford a greater protection than the single insertion. With regard to re-vaccination, two important facts are demonstrated: That many persons who were successfully vaccinated during infancy again become susceptible to vaccinia later, and that re-vaccination produces the strongest kind of immunity to smallpox. In Germany all children are required to become vaccinated during their first year, and again between the 11th and 13th. The percentages of successful re-vaccinations range from 69 to 91 per cent. The number of cases of smallpox developing are practically nil.

Source of Vaccine Supply.—The usual method of obtaining a supply of humanized virus was to make two or more insertions on the arm, and when the lesions reached the vesicular stage, to open one or more of these vesicles; the serum was taken directly from the arm and transferred to another person, or it was preserved by drying on pieces of glass, ivory, or threads. Some employed a small capillary tube, into which the fluid contents of the vesicle were drawn, and the ends sealed in a flame, or closed with wax. The usual custom, however, was to vaccinate direct from arm to arm; especially so was this in cities where vaccination was being done continuously. The dried crust, or scab, was also used, particularly by those who could not always obtain fresh material. These crusts were often active after several months, and there were instances in which they produced the typical vesicle even after a year or more. Great care was exercised in obtaining a crust from a typical lesion, and extra precautions were taken to keep this as dry as possible, it often being sealed in wax. At the present time humanized virus in any form is little employed, save in some of the Latin-American countries, where it is still the custom to use it; the bovine virus having superseded it in almost every civilized country.

The method of propagation and collection of

the virus is in general the same in all countries. The animals are young calves from two to six months old, sometimes cows. Heifer calves are preferable on account of greater cleanliness of the vaccinated surface, although bull calves are frequently employed. Young camels, goats, and water-buffalo calves are also used in some Oriental countries. Calves are selected as for their soundness and kept under observation for a few days, when they are cleansed by a bath of soap and warm water. Just before their vaccination an area of the skin, usually extending over the whole of the abdominal surface, is carefully shaven, cleansed again with soap and water, and then with sterilized water. Some operators apply some antiseptic, like trikresol, carbolic acid or corrosive sublimate, in disinfecting the skin, removing this with copious quantities of sterilized water. The shaven surface is then dried, and shallow incisions, just cutting through the outer layer of the skin (not drawing blood) are made with some sharp instrument. The incisions are made in long lines, or interrupted, so as to leave more or less healthy skin between them. The vaccine virus is then applied to these incisions and thoroughly rubbed in. The vaccine lesions begin to show on the second and third day, reaching full development between the fifth or sixth day. The most perfect method now in existence of propagating and collecting bovine vaccine virus is that employed by the Japanese government. Nearly all the virus supplied in Europe, Japan, and the United States has glycerin added to it in different proportions for preserving it, as well as to eliminate the extraneous bacteria. Some is furnished in the dried form, especially in the United States, but the bulk of it is glycerinated. In nearly all European countries the production of vaccine virus is under state control, although there are many private establishments which also furnish it. Germany has 25 state vaccine stations; Holland 11; Denmark 1; England 1, and 9 or 10 private establishments. In the United States there are 9 (8 private and 1 municipal), which are located as follows: New York city 1, Pennsylvania 4, District of Columbia 1, Michigan 2, Wisconsin 1. When compared with the distribution of these establishments in European countries, it will be seen at once that those in the United States are neither so numerous nor so advantageously located for supplying a virus to areas of equal extent, nor to the same number of population. In the former each vaccine establishment is supposed to supply virus to a certain territory, which is small as compared to the latter, and moreover, the most important feature of such is that it is possible to supply a fresh virus quickly without the risk of deterioration incident to temperature and transportation over long distances.

Bacteria in Vaccine.—The many investigations made of the bacteria found in both the humanized and bovine virus are almost conclusive that they are in no wise connected with the specific cause of vaccinia. All vaccine virus contains many varieties of bacteria, some of these may be pathogenic, but the majority are harmless. Their origin may be from several sources from an antecedent virus from the skin; alimentary tract of the vaccinated animal and from external contamination. Bovine virus usually contains the pus organisms, the staphylococcus aureus and albus, the streptococcus and

VACCINATION

in rare instances the tetanus bacillus. A vaccine virus may contain a great number of bacteria and yet be harmless, on the other hand only a few of the pathogenic varieties, and may cause serious consequences. As a rule the number of bacteria may be taken as an index of impurity resulting either from a faulty preparation, or not subjected long enough to the action of the glycerin. Any treatment to which the vaccine tissues are subjected, with a view of freeing it from the extraneous bacteria, influences its potency to a more or less degree. If glycerin be added, the number will gradually diminish. So in order to obtain the best results it usually follows that there arrives a time when such virus is free of bacteria, or nearly so, and when its potency is very little impaired. Sometimes, however, it may not always be possible to obtain such a virus, as for example in a threatened or actual smallpox epidemic, when it becomes necessary to protect the people. Then it may become necessary to assume the risk of using even a contaminated virus, that is to say, taken direct from the animal without any treatment, and of having the few complications which might possibly occur, than many deaths from smallpox which we are sure will follow among those exposed and not vaccinated.

Vaccination.—The slight injury to the skin, necessary in inoculating with the vaccine virus, appears on first sight to be of such a trivial character that it is not always treated with the regard which is due it. Vaccination is, in the strictest sense, a surgical operation. No one at the present time would be willing to undergo a surgical operation, it matters not how slight it might be, unless he was convinced that it would be performed skilfully, and that all necessary precautions would be taken to insure its success. Vaccination is no exception, and due regard both for a successful inoculation and avoidance of complications must be kept in view. The following important points are to be considered: The condition under which the wound is made; the person vaccinated; the state of health; the peculiarity of temperament, and the conditions after vaccination. The inoculation can be made in any part of the skin, the site most preferable is on the outside and middle part of the arm just over the insertion of the deltoid muscle. The site selected for vaccination should at first be thoroughly cleansed with soap and warm water, then rinsed well with clean water, followed by the application of an antiseptic solution (1 per cent carbolic acid preferable), which should be washed away after a few minutes with alcohol. The skin is then allowed to dry. When this is completed the site is ready for inoculation. Small scarifications of not more than one fourth inch square are made with some sharp, sterile instrument, for example, a lancet or needle, to remove the outer layer of the skin, care being taken during the process not to make the scarification too deep. Blood should never be drawn. The vaccine is then gently rubbed into the wound and allowed to become thoroughly dry. It is not advisable to protect the wound with any dressing or substance which might adhere to it, as this is one of the most fruitful sources of septic infection. Nature has already furnished the wound with a covering which, if kept intact, will answer better than any artificial substance. The vaccinated places should

be carefully protected against irritation, especially so when the lesion begins to assume the vesicular stage. It is then of the utmost importance to prevent its being injured. If, however, the vesicle is broken, and there ensue severe local and constitutional symptoms, it is of importance that it be given surgical treatment. With a pure virus, vaccination, if carefully performed and given thorough attention after treatment, is practically without danger. Vaccination is sometimes followed with complications, the lesion being infected with pus organisms, giving rise to local abscesses; also septicæmia, pyæmia, erysipelas, gangrene, and tetanus are occasionally observed. These may be conveyed by a contaminated virus, but are usually from the vaccination being improperly performed or from neglect of the wound. It has been estimated that as much as 70 per cent of the septic mischief is due to the injury of the vesicle taking place during the first and second week, the unsanitary surroundings or dirty habits of the patient largely contributing to complications. That these instances are of rare occurrence is borne out by the reports from the Imperial Health Office of Germany, which show that among 32,166,619 vaccinations of children there have been 115 deaths, 67 of these being in some way connected with the operation of vaccination. This gives a rate of a little over two per million, as compared with the thousands who die from smallpox. Sometimes a general vaccinia results. The eruption is to all appearances the same as the initial lesion, and runs a similar course. In addition to this there are post vaccinal eruptions, appearing from 10 to 14 days after. These may be a simple rash, a bullous eruption resembling pemphigus, impetigo, eczema, and purpura. While these have no direct relation to vaccinia, their occurrence at this time is thought to be due to the vaccinia being the exciting and not the predisposing cause.

Statistics.—Some are inclined to criticise statistics concerning the protective effects of vaccination, and believe that these can be so manipulated that anything desired can be proven by them. When there is a death from smallpox, there can be but little doubt as to the cause of death, so if the deaths from smallpox be taken, a charge of manipulating statistics to suit the purpose would rest upon a slender foundation. The number of deaths caused by this disease, taken per million inhabitants will, therefore, convey a very clear idea as to the rate among a population. London has records reaching as far back as 1629, and Geneva from 1580. In other countries, while the records are not so remote they are sufficient to give an idea of the prevalence of smallpox before vaccination. In England before vaccination, the rate was above 3,000 per million; in London it was over 4,000 per million. Now the rate is less than 20. In Prussia the rate before vaccination was slightly over 4,000, but on the adoption of vaccination it began to suddenly decline, and continued to do so until the vaccination law of 1874 was enforced, when the cases became fewer and fewer until now the rate is less than two per million. Sweden had a death rate from smallpox for 16 years prior to 1800, of 2,049 per million, while the rate from 1802 to 1811 fell to 623. In 1816 compulsory vaccination was enforced and for the next ten years the rate was 133. From 1890

to 1899, 100 years after the vaccination began to be practised the death rate fell from 2,049 to 1.

Compulsory vaccination has been in force in France only since 1902, the rate of smallpox among the army being now four per 100,000, as compared with the experiences of 1870-1. Vaccination was introduced into Austria in 1808, and was optional until 1900, when all school children were required to be vaccinated before entering. Vaccination and revaccination are compulsory for the army and navy. Denmark since 1810 requires all children to be vaccinated before the seventh year. Revaccination is compulsory for the soldier and inmates of public institutions. Italy has had compulsory vaccination since 1888. All children are required to be vaccinated within the first six months, and, if this is unsuccessful, to be revaccinated before they are a year old. Before the law was in effect the death rate for smallpox was 610 per million; in 1902 9.7 per million. In Belgium and Holland it is not compulsory, although all public officials and the army are required to be vaccinated. In the latter, while not obligatory, all children must go to school and no child can attend without being vaccinated. The teachers also must be vaccinated. India prohibited smallpox inoculations in 1880 and made vaccination compulsory. Similar laws are in effect in Australia, New Zealand and Cape Colony. Vaccination is only optional in Russia, except in the army and the public service. The great majority of the people do not avail themselves of vaccination, so epidemics are not uncommon. In Persia, Siam, and China little vaccination is done; therefore, smallpox is endemic. Japan has enforced compulsory vaccination since 1886, whereby the greater portion of the population has been vaccinated and revaccinated. Especially is this true of the populations of large cities and on the seacoast. No provisions are made in any of the cities for smallpox hospitals proper. When a case develops it is usually allowed to remain at home, or taken to a general hospital for treatment. No quarantine measures of any kind are enforced. Notwithstanding this fact smallpox has never been known to spread from any such cases. The same also may be said with regard to the German Empire, where no precautions are taken in the strict sense of the word against the spread of smallpox, the whole reliance being upon vaccination. It has been stated by those who opposed vaccination that the reason why the German Empire was so free from smallpox was the superior facilities for the isolation and treatment of cases, and not vaccination. This was investigated by the Local Government Board to ascertain just what methods were employed by the government and municipalities for the prevention of smallpox. Accordingly, an agent was sent to make this investigation. He encountered serious difficulties from the very first. In Berlin he was informed by the Central Health Office that so far as it was known there were no smallpox cases in Germany. The principal cities of the four chief states of Prussia, Bavaria, Saxony, and Württemberg were visited. In ten cities of these states, containing a population of over five million, or one tenth of the population of the German Empire, he did not find a single case. As a matter of history he ascertained that there had been 70 cases in seven years, 1895 to 1901 inclusive; in Cologne one case in 10 years; in

Frankfort nine cases in 10 years; in Wiesbaden 12 cases 11 years ago, but none since then; in Mainz none during 11 years; in Munich seven cases in eight years; in Nuremberg none for about 11 years; in Dresden no deaths for the past 10 years; in Leipsic eight cases in eight years and in Stuttgart none in six years.

Vaccination in the United States is not compulsory. It is, however, made obligatory in many of the States and municipalities, and applies only to school children. Children are debarred from attending school unless they are vaccinated. While vaccination is generally practised, there are many of the population, particularly in our southern States among the negroes, who do not vaccinate. Among these smallpox is not an uncommon occurrence. The United States government now requires that all alien immigrants shall be vaccinated before being allowed to land. This has been the means of reducing the danger from this source almost to a minimum, for smallpox has not developed among this class. Further instances in statistics could be cited to show the protective effects of vaccination against smallpox if they were considered necessary. The only thing which seems to be lacking in our country is a compulsory vaccination law and a strict governmental supervision of the production of vaccine virus. JOSEPH J. KINYOUN, PH.D., M.D.

Vachell, Horace Annesley, English author: b. 30 Oct. 1861. He was educated at Harrow and the Royal Military College, Sandhurst. He was a lieutenant of a rifle brigade in 1883 and subsequently lived some years in California, where he wrote several novels, among which are: 'The Romance of Judge Ketchum' (1894); 'The Quicksands of Pactolus' (1896); 'The Procession of Life.' A very readable account of his Californian experience is given in his 'Life and Sport on the Pacific Slope' (1900).

Vacherot, Etienne, French author: b. Torcenay, near Langres, 29 July 1809; d. 28 July 1897. He was educated at the Ecole Normale, and returned there as director of studies in 1838, from which he was dismissed through the enmity of the Clerical party. In 1868 he was elected to the Academy. His principal works are: 'Histoire critique de l'Ecole Alex-

VACUOLE—VACUUM

andrie' (1846-51); 'La Metaphysique et la Science' (1858); 'La Religion' (1869); 'La Democratie liberale' (1892).

Vacu'ole, in biology. See CELL.

Vacuum, in the strict sense, a portion of space entirely devoid of matter. The "absolute vacuum," as thus defined, is still a mere intellectual concept, because no physical or chemical method has yet been devised for effecting the absolute removal of every last trace of matter from any portion of space having finite, measurable dimensions. If a vessel of glass or other material impervious to air is filled with air or any other gas, and the contents of the vessel are then removed as perfectly as possible by means of a good modern air-pump, a degree of exhaustion can be attained which is so perfect that no residual matter can be detected in the exhausted space, save by the most refined methods of testing. Spaces which have been partially exhausted, but which still contain a quantity of gas great enough to be very easily detected, are called "partial vacuums," and those in which the process of exhaustion has been pushed to a very high degree are called, for the sake of distinction, "high vacuums." The first known method for producing a high vacuum was that of Torricelli, who filled a glass tube, closed at one end and more than thirty inches long, with mercury, and then inverted the tube so that its open end dipped beneath the surface of a vessel also containing mercury. The atmospheric pressure is capable of sustaining a pressure only equal to that due to a mercury column some thirty inches high (see BAROMETER); so that when the experiment here indicated is performed, the mercury sinks in the tube until it stands above that in the lower vessel by only this amount. The space at the upper end of the tube, from which the mercury thus retires, was long considered to be the most perfect vacuum attainable. It is not absolutely perfect, however, because it contains a small amount of mercury vapor, as well as traces of air. The method of Torricelli is not a convenient one for the practical production of high vacuums, for it is often objectionable to introduce mercury directly into the space to be exhausted, and it is also difficult, in many cases, to fill such a space with mercury so completely as to exclude small bubbles of air. Hence, in the practical production of vacuums, it is usual to remove the air (or other gas) from the space to be exhausted, by means of some form of a pump. The earlier pumps that were employed for this purpose (and which are still employed when high vacuums are not essential) were similar in principle to the "suction pumps" that are used for drawing water. They consisted of one or more cylinders, provided with tightly-fitting pistons, and valves as nearly perfect as possible. Each stroke of a pump of this kind removes a certain fraction of the mass of gas remaining in the vessel to be exhausted; but it is theoretically impossible to produce an absolute vacuum in this manner, because, in order to do so, an infinite number of strokes would be required. In practice, moreover, it is found to be impossible to prevent a certain amount of leakage around the pistons of such pumps; and there are other grave mechanical difficulties involved in their operation, when the vacuum that they give attains to a moderate degree of perfection.

For the production of the high vacuums that are used in the manufacture of incandescent electric lamps, and for the far more perfect ones that are needed in modern scientific research, it is therefore necessary to employ some form of mercury pump. Geissler, in 1855, invented a pump of this character, in which advantage is taken of Torricelli's principle for the production of a vacuum. The vessel to be exhausted is not directly filled with mercury, but it communicates with a large bulb which can be alternately filled with mercury and emptied, by merely raising and lowering a reservoir of mercury, with which it is connected by means of a flexible tube. When the mercury is caused to run out of the pump-bulb by lowering the reservoir, the air from the vessel to be exhausted expands into the bulb; and when the bulb is again filled by raising the reservoir, the air that the pump-bulb contains is caused to pass out through a special passage provided for that purpose, so that it does not return into the vessel that is being exhausted. By means of a mercury pump working on this principle, it has been found to be possible to reduce the pressure in the exhausted space to the hundred-thousandth part of an atmosphere. About 1865, Sprengel invented an ingenious and still more perfect mercury pump, by means of which exceedingly high vacuums may be obtained. In Sprengel's apparatus a stream of mercury is caused to pass down a small tube called the "fall-tube," in the form of a rapid succession of separate drops; a small quantity of air from the vessel to be exhausted being entrapped between every two successive drops. The mercury sweeps this entrapped air down through the "fall-tube," which discharges, at the bottom, into a cistern. The Sprengel pump is slow in its action, but by its aid it is possible to produce vacuums so nearly perfect that the residual pressure probably does not exceed the 400,000,000th part of an atmosphere. In producing high vacuums, it is necessary to remember that glass and other solid bodies possess the power of becoming coated with a layer of air (or other gas), which adheres to them like a thin film of varnish. This film is quite persistent under ordinary circumstances, and is not given off at once, even in a high vacuum. If the film were not removed during the exhaustion, however, it would gradually leave the glass afterwards, becoming disseminated through the exhausted vessel, and so reducing the vacuum very seriously. To prevent the vacuum from being injured in this manner, the exhausted vessel is gently heated, by means of a Bunsen burner or otherwise, while the pump is in action. The rise in temperature accelerates the motions of the molecules of the air-film to such an extent that these molecules fly off into the interior of the vessel, from which they are then removed by the pump. High vacuums are sometimes obtained by combining the air-pump with other devices that are suggested by chemistry and physics. Thus Andrews produced high vacuums by filling the vessel to be exhausted with carbon dioxide gas, removing the greater part of this gas by means of an air-pump, and then absorbing as much as possible of the remaining quantity, by means of fragments of caustic potash that had been previously introduced. Advantage has also been taken, in a similar manner, of the absorptive power of freshly-prepared charcoal, for improv-

VACUUM

ing air-pump vacuums. The charcoal is placed preferably in a side tube communicating with the exhausted vessel, and is kept heated during the exhaustion, in order to prevent it from absorbing the gas until after the pump has ceased working. The exhaustion having proceeded by means of the pump to as high a degree as is possible, or as is desired, the connection to the pump is sealed off, and the charcoal, upon being allowed to cool, then absorbs within its pores a considerable part of the gas still remaining in the vessel. The advantage of a device of this sort is, that the perfection of the vacuum in the finished tube can be regulated, within certain limits; for by heating the charcoal more or less, a greater or lesser part of the gas that it contains can be temporarily expelled, so as to reduce the degree of the vacuum. Dewar has successfully applied liquid hydrogen to the perfecting of vacuums; the vessel to be exhausted being provided with an auxiliary bulb which can be plunged into the liquid hydrogen after the exhaustion has proceeded as far as possible by the direct action of the pump. The intense cold of the liquid hydrogen causes a considerable part of the residual gas in the vessel to condense upon the walls of the auxiliary bulb, which is then sealed off from the main bulb by means of a blowpipe.

For many reasons, the phenomena accompanying the discharge of electricity through vacuums have been greatly studied by physicists. A perfect vacuum would (according to received theories) be a perfect non-conductor of electricity; and while such a vacuum is unattainable by experimental methods, vacuums have been prepared, through which the discharge of a powerful induction coil cannot be forced. At ordinary atmospheric pressure, the discharge from an electrical machine, or an induction coil, passes through a gas intermittently, and in the form of thread-like bunches of sparks, resembling miniature flashes of lightning. Suppose, now, that electrodes are sealed into the two opposite ends of a vacuum tube, and that the tube is gradually exhausted by a good air-pump. The discharge, at first resembling loose threads gathered together at the ends, gradually loses this appearance as the exhaustion proceeds, and after a time the whole tube becomes filled with pale light; and when the pressure becomes reduced to about the ten-thousandth part of an atmosphere, the discharge often assumes a stratified or striated appearance. In a vacuum tube of cylindrical form, with an internal electrode at each end in the form of a circular metal disk with its plane perpendicular to the length of the tube, we observe, as the pressure approaches the value here given, that there is a notable difference in the appearance of the tube at the two ends. The negative electrode is often covered with a soft, velvety glow, either wholly or in patches. Outside of this there is a dark space, called "Crookes' dark space," or the "first dark space"; the width (or thickness) of this being roughly (but not accurately) proportional to the reciprocal of the density of the gas in the tube. According to Pulf, in a tube such as here described, the thickness of the Crookes' dark spaces, when the residual gas is air, and the pressure is reduced to the 13,000th of an atmosphere, is about one inch. Next beyond the Crookes' dark space comes a luminous space, which is called the "negative glow"; and

next after this there is usually (but not invariably) a second comparatively non-luminous region, called the "second negative dark space," or, sometimes, the "Faraday dark space." Next after this comes a glow which is called the "positive column," and which reaches all the way to the positive electrode. It is in this part of the tube that the striations, referred to above, occur. They consist in a succession of disk-shaped luminosities, spaced at fairly uniform distances so long as the tube is of uniform diameter, and separated by dark intervals; the disks being perpendicular to the axis of the tube. The stratifications are sometimes absent, and when they are present they often have an irregular motion of translation along the tube, this motion being sometimes in one direction and sometimes in the other; that is, sometimes towards the negative electrode, and sometimes away from it. When the tube contains a mixture of gases, there appears to be a separate series of stratifications for each constituent gas. The motion of the stratifications is best observed by noting the reflection of the tube in a rapidly revolving mirror, and it is often of such a character as to make the stratifications appear confused to the unaided eye, or to obliterate them completely. When the tube has movable electrodes, it is found that a shift of the position of the negative electrode (that is, the cathode), causes a corresponding shift in the positions of the stratifications; these behaving, in this respect, as though they were rigidly connected with the cathode; but they are not at all affected by shifting the position of the positive electrode (or anode), except that since they do not extend beyond the anode, they are successively obliterated as the anode passes them. The phenomena of these vacuum discharges are very complicated, and special works dealing with these matters must be consulted for a really adequate description of them. The vacuum tubes produced at the factory of Heinrich Geissler, at Bonn, Germany, were of such excellence that the expressions "Geissler tubes" and "vacuum tubes" could at one time be regarded as almost synonymous.

The phenomena of electrical discharges in partial and high vacuums have been investigated by many distinguished physicists; but the name of Sir William Crookes is associated with some of the most remarkable of the discoveries that have been made, and many of the tubes that have been prepared for illustrating the properties of high vacuums were designed by him, and are therefore known by his name. Crookes discovered, for example, that when the exhaustion of a tube is pushed considerably beyond the point at which the appearances described above are observed, the character of the electrical discharge is again changed, and mechanical, electrical and luminous effects are to be observed, which are not manifested in the lower vacuums. Exceedingly interesting mechanical effects were discovered in tubes which had been exhausted until the pressure of the residual gas was reduced to about the 250,000th of an atmosphere, and Crookes invented the radiometer for the purpose of demonstrating some of these. The radiometer consists of a glass sphere, two inches or so in diameter, and containing a light flier or wheel provided with four horizontal arms, each arm carrying, at its extremity, a light, vertical vane, made of mica and blackened on

VACUUM

one side. The wheel is poised delicately upon the point of a fine needle, so that the smallest force will cause it to rotate. When the glass bulb has been exhausted so that the residual pressure is only about the 250,000th of an atmosphere, and the instrument is placed in the sunlight, or exposed to any source of radiant heat, the little flier or wheel at once begins to rotate in such a direction that the unblackened sides of the vanes move forward. Numerous explanations of the operation of this little instrument have been given, but that which is based upon the kinetic theory of gases appears to be the most satisfactory. (See GASES, KINETIC THEORY OF.) According to this view, a gas consists of an enormous number of little particles, or molecules, flying about in a space that is otherwise devoid of matter. In a gas of ordinary density, these particles are so numerous that they do not travel, on an average, more than a few millionths of an inch without colliding with one another. But when, by removing nearly all of the gaseous molecules, we make it possible for the molecules that remain to travel, on an average, something like an inch or two between successive collisions with one another, these residual molecules act like tiny projectiles, and are capable of producing mechanical effects that are not observable when the motions of the molecules are interfered with by the incessant collisions among the molecules themselves. The full theory of the radiometer is not yet in an entirely satisfactory condition; but in a general way we may say that when the vanes of the little wheel are exposed to a source of radiant heat, the black sides absorb heat more readily than the light ones, and hence become warmer. This means that the molecules composing the vanes are vibrating more energetically on the black side, so that on this side they strike more energetic blows against such gas molecules as chance to come in contact with them. From the equality of action and reaction, it follows that the vanes of the little flier will experience a reactionary force tending to make them revolve with the light side foremost. In order that the radiometer may work satisfactorily, it appears to be necessary to have the vacuum sufficiently high to ensure that, on an average, a gas molecule which has collided with one of the vanes will strike the glass wall of the enclosing bulb, before encountering another gas molecule.

The behavior of a high vacuum under the influence of electrical discharges is especially interesting. When the perfection of the vacuum is such that the average distance that a molecule of the residual gas travels between successive collisions with its fellow molecules is comparable with the dimensions of the tube itself (that is, when the pressure in the tube is only about one millionth of an atmosphere), the position and shape of the positive electrode, or anode, appear to have very little influence upon the character of the discharge. In such a case the nature of the visible discharge appears to be determined almost absolutely by the cathode, or negative electrode, and the discharge makes itself manifest in the form of a shaft of pale bluish or purplish light, extending outward into the tube in a direction approximately perpendicular to the surface of the negative electrode. If this electrode is made concave, the streamer that proceeds from it (and which is known as the

"cathode ray") may be made to converge to a focus, diverging again after passing the focus, so that the complete streamer has the general form of a double cone, one base of which rests upon the cathode, while the other rests upon the glass wall of the tube, opposite to the cathode. Where the cathode ray strikes the glass, the glass is excited to fluorescence, and it also becomes heated at this point. The whole phenomenon, in fact, is of such a nature as to strongly suggest that the cathode ray consists of a torrent of gas molecules; and it is natural to assume that the molecules of the residual gas within the vacuum tube receive electrical charges as they come in contact with the cathode, being then violently repelled from it, in a direction normal to its surface. Crookes found, in fact, that this "projectile hypothesis" agrees well with practically all of the phenomena that he observed in these high vacuums. He observed, for example, that the cathode ray is apparently cut off by the interposition of any solid matter, even by a very thin film of mica, which would presumably be transparent to ether-waves; and he constructed many ingenious and beautiful forms of tube for showing that the cathode ray is capable of exerting precisely such mechanical effects as would be expected if the projectile hypothesis were correct. In one of the most interesting of these tubes, the cathode ray is caused to strike against one side of a little paddle-wheel, the wheel being thereby caused to revolve, just as a water-wheel revolves when its lower half is immersed in a running stream of water. The direction of rotation, in this form of tube, may be reversed readily, by reversing the polarity of the two electrodes. Objections may be urged to this simple projectile explanation, however. For example, there are reasons for doubting if an isolated molecule of gas can receive an electrical charge, in the way that the molecules of the residual gas have been assumed to be charged by the cathode. Despite this objection, it must still be regarded as probable that the projectile hypothesis of Crookes is true in some form or other. According to the electron theory that has been growing up for the past few years, the cathode ray consists, not of whole gas molecules, but of tiny particles that are split off from the molecules. These ultimate particles, or electrons, certainly do carry electrical charges, and it is quite likely that the mechanical and other effects that are observed in vacuums where the pressure is not more than the millionth part of an atmosphere are due to the projectile-like motions of the free electrons. Crookes' experiments were carried out before the idea of electrons was developed; but it should be said, in justice to him, that in describing his work he frequently emphasized his belief that the matter in his tubes is in a state quite different, in some respect, from any state with which we had previously been familiar; and he called this, provisionally, the "fourth state" of matter, since he considered it to be as different from a gas as a gas is from a liquid or a solid. Editorial Staff, 'Encyclopædia Americana.'

Vaga, *vā'gā*, **Perino Del**, or more properly **Pietro Buonaccorsi**, Italian painter: b. Florence 1500; d. Rome 1547. He was taught painting by a Florentine named Vaga (whence the name generally applied to him), by whom he was brought to the notice of Giulio Romano and other pupils of Raphael. The latter, then engaged upon his designs for the loggia of the Vatican, employed him to assist Giovanni da Udine in the arabesque work, and subsequently entrusted him with the execution of some of the principal frescoes. He thenceforth was a favorite pupil of Raphael, after whose death he rose into great reputation. Compelled to leave Rome in 1527, on the sack of the city, he went to Genoa, where he entered the service of the prince Doria and founded a school of painting. He returned to Rome during the pontificate of Paul III., by whom he was entrusted with many valuable commissions; and at the time of his death probably stood at the head of the Roman school. He designed after the style of Michelangelo, and by Vasari is placed in that respect next to the great Florentine master. His works are widely distributed over Italy, the best being the 'Creation of Eve' in the church of Saint Marcello in Rome. He also frescoed the ceiling of the Sala Regia in the Vatican. His artistic activity extended to the designing of tapestry, baldacchini, and the execution of stucco work.

Vagantes, *vā-gān'tēz* (wanderers, vagabonds), a term applied in the Middle Ages to the wandering bands of scholars (*vagi scholares*), who, during the intellectual movement which pervaded Europe during the 12th and 13th centuries, formed a distinct and characteristic class in the population, and played an important part in the social life of the time. They were sometimes called *Bacchantes*—Brethren of Bacchus—from their drunken roystering habits. They were renowned for their songs, full of life and movement, and often keenly satirizing the clergy and religious orders. These 'Carmina Burana' form a collection, a manuscript copy of which is still to be found in the Benedictine Abbey at Munich. The verses are in rhymed Latin, or written in macaroni style of German or French and Latin; some are German or French pure and simple. They deal with religious controversy, love, wine and sport; some are absolutely frivolous; others pious in tone. In France the *vagantes* were known as "Goliardæ," probably because they generally pursued their peregrinations under the leadership of a man of gigantic stature (Goliath). Consult: Hubatsch, 'Die lateinischen Vaganten des Mittelalters' (1870); Von Barnstein, 'Carmina Burana Selecta' (1879).

Vagrants. See MENDICANCY.

Vaigach, *vī-gāch'*, Russia, an island in the Arctic Ocean, belonging to the government of Archangel, separated from the mainland by the Yugor Strait and from Nova Zembla by Kara Strait, and forming with Nova Zembla the western boundary of the Kara Sea. The mountain chain of the adjacent mainland peninsula is continued in the island by a low chain near the east coast. Vegetation is scant, but the island is visited by Russians and Samoyedes in search of fur-bearing animals, whales, various kinds of birds, and fish. The area is about 1,410 square miles.

Vail, **Alfred**, American inventor: b. Morristown, N. J., 25 Sept 1807; d. there 18 Jan. 1859. He was graduated at the University of the City of New York in 1836, and in 1837 became associated with S. F. B. Morse (q.v.) in his telegraphic experiments. His mechanical knowledge applied to the experimental apparatus resulted in the first practicable Morse machine. He invented the combination of the horizontal-lever motion to actuate the style; devised the alphabet of dots, spaces, and dashes which it necessitated; and in 1844 constructed the automatic lever and grooved roller which embossed on paper the characters he originated. He was appointed assistant superintendent of the telegraph line constructed between Baltimore and Washington in 1843, and on the completion of the system, in 1844, was stationed at Baltimore, where he invented the finger-key, and received the first message from Washington, Consult Pope, 'The American Inventors of the Telegraph,' in 'The Century,' Vol. XXXV. (1888). See HENRY, JOSEPH.

Vail, **Charles Henry**, American Universalist clergyman: b. Tully, N. Y., 28 April 1806. He studied music in New York, and for a while was engaged in teaching it. He was graduated at Saint Lawrence University, Canton, N. Y., in 1822, and during the following year pursued his theological studies. In 1823-4 he was minister of All Souls' Church, Albany, N. Y., and from 1824 to 1901 of the First Universalist Church in Jersey City, N. J. In 1901 he was nominated governor of New Jersey by the Socialist party, of which in 1901-2 he was national organizer. He has lectured in many parts of the country, and has published: 'Modern Socialism' (1867); 'National Ownership of Railways' (1867); 'Scientific Socialism' (1869); 'The Industrial Evolution' (1869); 'Mission of the Working Class' (1900); 'Socialism: What It is and What It is Not' (1900); 'The Socialist Movement' (1901); 'The Trust Question' (1901); and 'Socialism and the Negro Problem' (1903).

Vail, **Thomas Hubbard**, American Protestant Episcopal bishop: b. Richmond, Va., 21 Oct. 1812; d. Bryn Mawr, Pa., 6 Oct. 1889. He was graduated from Washington (now Trinity) College, Hartford, Conn., in 1831, and from the General Theological Seminary in 1835. He took orders in the year last named, and in 1837 organized Grace Church, Worcester, Mass. He became rector of Christ Church, Cambridge, Mass., in 1837, in 1839 of St. John's, Essex, Conn., and was rector of Christ Church, Westerly, R. I., 1844-56. He was subsequently rector of St. Thomas' Church, Taunton, Mass., 1857-63, and of Trinity Church, Muscatine, Iowa, 1863-4. In the last named year he was consecrated first bishop of Kansas. He founded Bethany College at Topeka, Kan., and served as its president, and was author of 'The Comprehensive Church' (1841; 3d ed. 1883); etc.

Vaisēshika, *vī-shā'shē-kā*, a system of Hindu philosophy of ancient origin and closely resembling in its principles some of the conclusions of modern science. It teaches that all material substances are composed of atoms mechanically united, and indestructible; that the combination of these atoms in the existing world will pass away, and the existing order of things

will also pass away. The founder of the system was Kanada, supposed to have lived about 500 B.C., and the system itself was long regarded as heretical, from the Brahmanic standing. It is now, however, fully recognized as of equal standing with the five other leading systems of Brahmanic philosophy, the two Mimamsas, and the Nyaya, which were the three originally orthodox systems, and the Sankhya and the Yoga, which also bore for some time the stamp of heresy.

Vaishnavas, *vīṣṇa-vas*, one of the three great divisions of the Hindu religion, distinguished from the others by the special worship of Vishnu, but itself divided into many sects, based on the differences attending that worship. Horace Hayman Wilson has divided the Vaishnavas into the following sections: (1) Rāmānujas, Sri Sampradāyis, or Sri Vaishnavas; (2) Rāmānandis, or Rāmāvats; (3) Kabir Panthis; (4) Khākis; (5) Mālūk Dāsīs; (6) Dādū Panthis; (7) Rāya Dāsīs; (8) Senāis; (9) Vallābhāchāris, or Rudra Sampradāyis; (10) Mirā Bāis; (11) Madhwāchāris or Brahma Sampradāyis; (12) Nīmāvats, or Sanakādi Sampradāyis; (13) the Vaishnavas of Bengal; (14) Radhā Vallabhis; (15) the Sakhi Bhāvas; (16) Charan Dāsīs; (17) Harischandis; (18) Sadhnā Panthis; (19) Mādhavis; and (20) Sannyāsīs, Vairāgis, and Nāgas.

All these sects have their common ground in the belief in the supremacy of Vishnu over the other gods of the Trimurti. They differ, however, in the character and degree which they assign to this supremacy, and consequently in their religious devotions and practices. The Vaishnavas include many monastic bodies, composed of members of various Hindu castes, all united in doing honor to Vishnu as chief of the Hindu triad. See BRAHMA; BRAHMANS; VISHNU.

Vaishnavism. See VAISHNAVAS.

Vaisravana, *vīs-ṛa-vāṇa*, in the pantheon of the Hindu Sivaites, the god of wealth.

Valais, *vā-lā* (German, WALLIS, *vällis*), Switzerland, a southern canton, abutting on France and Italy, and having an area of 2,027 square miles. The capital is Sion. The canton is surrounded by the loftiest and most magnificent mountain chains in Europe, the Bernese, Pennine, and Helvetian or Lepontine Alps, all containing ridges 13,000 to 15,000 feet high, with magnificent glaciers. The Rhone flows through the whole length of the canton, forming the largest valley in Switzerland, and discharges into the Lake of Geneva. Where the elevation is not too great the mountain-slopes are covered with large and valuable forests of pines, and lower down of hardwood trees, succeeded by productive orchards; rich pastures abound, and support numerous cattle, the principal source of subsistence of the inhabitants. In the lower valley of the Rhone there is much arable land, the finer fruits are grown, and silkworms reared. The canton produces a good deal of wine. In the Upper Valais, German, in the Lower, French, is spoken. The canton was admitted into the confederation in 1553. Pop. (1900) 114,438, of whom only a small number were Protestants.

Valdai (*vāl'dī*) Hills, Western Russia, a range of hills in the provinces of Novgorod and

Tver, averaging about 300 feet in height, but rising in Mount Popovagora to 1,080 feet. They are well wooded, and contain the sources of the Volga, Dnieper, and Dūna.

Valdés, *vāl-dās'*, **Gabriel de la Concepción** (Placido), Cuban poet: b. Matanzas, Cuba, 18 March 1809; d. Havana, Cuba, 28 June 1844. He was a mulatto and his early life was spent in poverty. His poetry was popular and was published in different newspapers and reviews, but the sentiments expressed seem to have involved him in trouble with the authorities, as he was at one time imprisoned for several months. In 1844 he was accused of complicity in a conspiracy of the blacks against the whites, and though innocent was shot as a traitor. He was author of various romances and novels, and his poems have been published in several editions. Perhaps the best of his verse is his prayer, composed just prior to his death and which was translated into English by Mary Webster Chapman. Editions of his works include 'Poesias de Placido' (1838); 'Poesias de Gabriel de la Concepción Valdés, Placido' (1847).

Valdes (Valdeso Valdez), **Juan de**, Spanish-Italian reformer: b. Cuenca, Castile, 1500; d. Naples 1544. He was brother to Alphonse de Valdes, the imperial secretary of state, and was himself secretary to Charles V. in Germany. After a sojourn of ten years he left Germany and went to Naples to occupy the post of secretary to the viceroy. There he gathered around himself a band of choice spirits, including Vermigli (see PETER MARTYR), Ochino (q.v.), and the high-born ladies Vittoria Colonna, Julia Gonzaga, and Isabella Manriquez. Valdes and his company were enthusiastically set upon effecting the regeneration of the church of their day, but although they had no desire to leave the Roman obedience, they were regarded as heretics. Valdes wrote 'Spiritual Milk'; 'The Christian Alphabet,' and some commentaries on the New Testament. He wrote in Spanish, but the works above mentioned are only extant in their Italian translations. Consult Stern, 'Alfonse et Juan Valdez' (1866); Carasco, 'Alfonse et Juan Valdez' (1880); McCrie, 'Reformation in Italy.'

Valdes, Palacio. See PALACIO VALDES.

Valdez, Melendez. See MELENDEZ VALDES JUAN DE.

Valdivia, *vāl-dē'vā-ā*, **Pedro de**, Spanish soldier, conqueror of Chile: b. Serena, Estremadura, about 1498; d. near Tucapel, Chile, 1554. He served in the Italian wars; went to Venezuela about 1534; and soon after joined Pizarro in Peru. He aided in the defeat of Diego Almagro (q.v.) at Las Salinas. Later he led 150 Spaniards and several thousand Indians in an expedition against Chile, which had been ceded by Charles V. to Pedro Sanchez de Hoz. After defeating a large force of Indians he established Santiago, 12 Feb. 1541. Subsequently the Spaniards were many times attacked by the Indians and were cut off from Peru. In December 1543 reinforcements arrived, and the colony thereafter prospered. In September 1544 Valparaíso was founded, and in 1546 Valdivia marched into the Araucanian district, and in a great battle conquered the Indians. In 1547-9 he joined Gasca, the royalist, against Pizarro, whom they

VALDIVIA—VALENS

defeated. In 1550-2 he established Concepción, Valdivia, and other places. A wide uprising of the Indians occurred in December 1553 and while Valdivia was endeavoring to suppress this revolt he was captured and put to death.

Valdivia, Chile, (1) Capital of a southern province of the same name; on the Valdivia River, 9 miles from its mouth, with a safe and roomy harbor, and railway connections with the rest of Chile. The entrance to the river is fortified. The town is built on level ground, and is surrounded by apple orchards and native forest. It has an active coasting trade, chiefly with Valparaíso. Valdivia was founded in 1551 by Pedro de Valdivia, one of Pizarro's lieutenants, and it was at one time a place of great wealth. Pop. (1900) 9,819. (2) The province of Valdivia has an area of 8,315 square miles. Besides splendid forests it has large upland pastures, and deposits of coal. Pop. 60,687.

Valdosta, vāl-dōs'tā, Ga., city, county-seat of Lowndes County; on the Georgia Southern & Florida, the Plant System, and the Atlantic, Valdosta & Western R.R.'s; about 150 miles southwest of Savannah. It was settled in 1859 and in 1860 was incorporated. It is in a fertile agricultural region, the principal products of which are cotton, fruit, corn, wheat, and vegetables. The chief manufactures are cotton products, including cotton cloth, and lumber products. The city owns and operates the waterworks. There are three banks, having a combined capital of \$270,000 and deposits amounting to \$1,267,980. The government is administered under a revised charter of 1900, which provides for a mayor, who holds office two years, and a city council. Pop. (1890) 2,854; (1900) 5,613.

Valence, vā-lōns, France, capital of the Department of Drôme, on the left bank of the Rhone, 66 miles south of Lyons. The principal buildings are a small ancient cathedral in Romanesque style, with a bust by Canova of Pope Pius VI.; a public library of 20,000 volumes, several higher educational institutions, a museum of antiquities and paintings, a handsome court-house, and a theatre. It is the see of a bishop, and has a court of first resort. Its chief manufacturing industries are cloth-printing, brewing and distilling, tanning, and hardware-making; and it has a trade in timber, grain, coal, silks, and wine. Pop. (1901) 24,199.

Valencia, vā-lēn'shī-a (Sp. vā-lēn'thē-ā), Spain, capital of a province of the same name, on the south bank of the Turia or Guadalaviar, near the eastern coast, 190 miles southeast of Madrid. The city walls were removed in 1871, and their site transformed into broad boulevards, but two old gates have been left in position. Several bridges across the river lead to northern suburbs. The chief square is the Plaza del Mercado, or market-place, on the north side of which is the Lonja de la Seda, or silk exchange, a beautiful Gothic building of the 15th century, restored in 1892-5. The other noteworthy buildings and institutions of the city are: The cathedral (La Seo), completed in 1482, with an octagonal Gothic bell-tower called El Miguelete; the Colegio del Patriarca, an ecclesiastical building in Renaissance style (1586-1605), containing a church of Corpus Christi, pictures, frescoes, tapestry, etc.; the church of San Nicolas, with fine paintings by Juanes; the university, founded in 1441, with a

valuable library; the Audiencia, formerly the chamber of deputies of the kingdom of Valencia, a 16th-century Renaissance edifice; the provincial picture gallery, strong in the Valencian school; the citadel, built by Charles V., now in ruins; the provincial and the military hospital; the penitentiary; the archiepiscopal palace; etc. The fine botanical garden, the bull-ring, a theatre, and some other buildings are situated outside of the boulevard line; and on the north side of the river is the charming Alameda, lined with plane-trees. El Grao, the harbor, is at the mouth of the Turia, on the north side, and beside it are sea-bathing resorts. Valencia has manufactures of silk, cigars, paper, oil, chocolate, soap, etc., and a considerable and increasing trade in wine, oranges, rice, oil, etc. Valencia figured in Roman history, and was destroyed by Pompey in 75 B.C. It was long the capital of a kingdom of Valencia, which came to an end in 1319. In 1812-13 it was occupied by the French under Suchet. Pop. (1897) 204,768; of province, 775,995.

Valencia, Venezuela, the capital and most important city of Carabobo, in the Aragua Valley, near the west end of Lake Valencia, 24 miles by rail south of Puerto Cabello; altitude 1,824 feet above sea-level. It is the third city of Venezuela in population and importance, and is the trade centre of a large agricultural section handling sugar, hides, coffee, cocoa, etc. Here are electric lights, beautiful parks and squares, regular streets, a national college, a cathedral, etc. In the vicinity are celebrated hot springs. Valencia was established in 1555. After the separation from Colombia the first Venezuelan congress met here. Pop. (1894) 38,654.

Valenciennes, vā-lōn-sē-ēn, **Achille**, French anatomist and surgeon: b. Paris 9 Aug. 1794; d. there 14 April 1865. He was made professor of anatomy at the Ecole Normale in 1830, and in 1836 professor of ichthyology at the Museum of Natural History. He collaborated with Cuvier in ichthyological researches and with him began the 'Histoire naturelle de Poissons' (1829-40), and continued the work after Cuvier's death. He also wrote 'Histoire naturelle des Mollusques, des Annélides et des Zoophytes' (1833).

Valenciennes, France, town in the department of Nord, at the junction of the Rhondelle with the Scheldt, 30 miles southeast of Lille. Its chief buildings and institutions are: the church of Notre Dame du Saint Cordon, a modern edifice in 13th century style, with fine stained-glass windows; an old Gothic church, with a modern tower; the town-hall, a 17th century building, with a façade of more recent date; a lyceum; a museum of painting and sculpture, rich in works of the Flemish school; a natural history museum; a municipal library; a civil and military hospital; an arsenal, and barracks. The district yields much coal, and among the manufactures of the town are chicory, beet-sugar, salt, potash, soap, glass, iron, woolen yarn and goods, linen, etc. The once flourishing lace industry is now extinct. Pop. (1901) 31,007.

Valenciennes-lace. See LACE.

Valens, vā'lēnz, **Flavius**, Roman emperor of the East: b. near Cibalis, Pannonia, 328; d.

VALENTIA — VALENTINIAN

Adrianople 9 Aug. 378. He was declared at 36 the associate of his brother, Valentinian I., who made him emperor of the East. He subdued the revolt of Procopius and was frequently with the Goths under Athanaric, who were several times defeated, and sued for peace, which was granted them (370). In 377 the Goths, driven south by the Huns, asked and were allowed to settle on Roman territory, but the terms of the treaty not being faithfully observed by the subjects of Valens, they soon took up arms, and in 378 defeated Valens and destroyed the greater part of his army. Consult: Gibbon, 'Decline and Fall of the Roman Empire'; Hodgkin, 'Italy and her Invaders' (1880-99).

Valen'tia. See VALENCIA.

Val'en'tine, Saint, a bishop and martyr of the Church, who was put to death at Rome for his faith during the persecution under Claudius II., 14 Feb. 270. The custom of choosing valentines on his day is of considerable antiquity, and it was an old belief that birds began to mate on this day. On the eve of Saint Valentine's day young people of both sexes used to meet, and each of them drew one by lot from a number of names of the opposite sex, which were put into a common receptacle. Each gentleman thus got a lady for his valentine, and became the valentine of a lady. The gentlemen remained bound to the service of their valentines for a year. A similar custom prevailed in the Roman Lupercalia, during which festival boys drew from a common box, each tablet inscribed with the name of a girl, to whom, under the auspices of Juno Februata, they were to be devoted for a twelvemonth.

Valentine, Edward Abram Uffington, American poet: b. Bellefonte, Pa., 29 Jan. 1870. He was educated at Haverford College, Pa., and Maryland University, is library editor of the *Baltimore Evening News*, and has published 'The Ship of Silence,' a book of verse (1902).

Valentine, Edward Virginius, American sculptor: b. Richmond, Va., 12 Nov. 1838. He studied anatomy at the Medical College of Virginia, and began his art training at Paris under Couture. He was subsequently a pupil under Bonaiuti in Italy, and Kiss in Germany; and attended the Royal Academy of Arts in Berlin. He was president of the Richmond Art Club and the Valentine Museum; one of the executive committee of the Virginia Historical Society; and a member of several patriotic and secret organizations. His works include: 'The Nation's Ward'; 'Unc' Henry'; 'Andromache and Asyanax'; 'The Blind Girl'; and bronze busts of American generals and statesmen.

Valentine, Milton, American Lutheran theologian: b. near Uniontown, Md., 1 Jan. 1825. He was graduated at Pennsylvania College, Gettysburg, in 1850; ordained to the Lutheran ministry in 1852; held various pastorates in Virginia and Pennsylvania till 1866; then became professor of ecclesiastical history at the Lutheran Theological Seminary, Gettysburg. In 1868 he was called to the presidency of the Pennsylvania College. He resigned that position in 1884 and became professor of systematic theology and chairman of the faculty at the Lutheran Theological Seminary. He was joint editor of the 'Lutheran Quarterly' in 1871-6 and 1880-5, and again resumed that editorship

in 1898. His publications include: 'Natural Theology, or Rational Theism' (1885); 'Theoretical Ethics' (1897); 'Christian Truth and Life' (1898); and other writings.

Valentin'i, Philip Johann Joseph, American archæologist: b. Berlin, Germany, 1828; d. New York 16 March 1899. He was of Italian parentage, was educated at the Gymnasium of Torgau and at the University of Berlin, making a special study of philology and jurisprudence, and in 1854, under government auspices, founded the seaport Puerto Limon in Costa Rica. While thus engaged he learned that the natives had no knowledge of their ancestors, and on his return to Germany he made a thorough research concerning the history of early Spanish colonization in Central America. He later studied the prehistoric remains of Guatemala and the surrounding regions, and his 30 years' labor in deciphering the pre-Columbian manuscripts placed him in the front rank of American archæologists. An achievement which added much to his reputation was his interpretation of the famous Mexican calendar-stone, concerning which he published an account, 'The Mexican Calendar Stone' (1878). His other works include: 'The Landa Alphabet' (1880); 'Two Mexican Chalchihuites' (1881); 'The Olmecas and the Tultecas' (1883); 'A Study of the Voyage of Pinzon to America' (1898); etc.

Valentin'ian I., Flavius, Roman emperor: b. Cibalis, Pannonia, 321 A.D.; d. Bregetio, Germany, 17 Nov. 375. He entered the army early in life and by his capacity and courage rose rapidly in rank under Constantius and Julian, and on the death of Jovian was chosen as his successor, 26 Feb. 364. He resigned the sovereignty of the East to his brother Valens (q.v.) and himself governed the West with ability till his death. He possessed great military skill and was a prudent administrator. His reign was occupied in campaigns against the barbarians along the borders of the empire. By his first wife he had Gratian, and by the second, Justina, another son, Valentinian II., and three daughters, one of whom, Galla, became the wife of the Emperor Theodosius I. He was succeeded by Gratian and Valentinian II.

Valentinian II., Flavius, Roman emperor: son of Valentinian I.: b. 372 A.D.; d. 15 May 392. He was an infant of 4 years at the death of his father and received from his elder brother, Gratian, the provinces of Italy, Illyricum, and Africa as his share of the Western empire. During his minority Gratian practically exercised supreme authority until his own death in 383. Maximus, the murderer of Gratian, paid no attention to Valentinian till 387, when he invaded Italy and Valentinian then fled to Thessalonica to seek aid of Theodosius, emperor of the East. Theodosius now governed in effect for Valentinian, who, while in Gaul, was murdered by Arbogastes, the commander-in-chief of his army.

Valentinian III., Flavius Placidus, emperor of the West, grand-nephew of the preceding: b. about 419; d. 455. He was the son of Constantius III., by Placidia, the daughter of Theodosius the Great, and was seated on the throne of the West by Theodosius II., emperor of the East, in 425. He was a weak prince, who never really ruled during the 30 years that he sat on

VALENTINIANS — VALERIAN

the imperial throne; his mother, Placidia, governing for him till her death in 450. She was succeeded by the eunuch, Heraclius. Valentinian's treatment of Bonifacius made the latter adopt the cause of Genseric (q.v.), chief of the Vandals, and thus Africa was lost to the empire. Aetius, the buttress of his empire, the emperor stabbed to death in a fit of envious jealousy (454), but next year was himself slain by Maximus, whose wife he had ravished. Valentinian was the last of the Theodosian line. Fletcher's powerful tragedy of 'Valentinian,' produced before 1618 but not printed till 1647, was founded upon events in the life of this monarch.

Valentinians, the followers of Valentinus, an Alexandrian gnostic, who in 141 went to Rome, where he actively disseminated his views up to the year 160. He supposed that in the pleroma (q.v.) there were 15 male and as many female æons united in wedlock. The youngest æon, Sophia (Wisdom), brought forth a daughter, Achamoth, whence sprang the Demiurge, who created mankind. This Demiurge aspired to be regarded as the only god, and led many angels into the same error. To repress his insolence, Christ descended, Jesus, one of the highest æons, joining him when he was baptized in Jordan. The Demiurge had him crucified; but before his death both Jesus the Son of God and the rational soul of Christ had separated, leaving only the sentient soul and the ethereal body to suffer. The Valentinians were divided into many sects and schools.

Valentinus, vāl-ən-tī'nūs, **Basilus**, German alchemist: b. at the end of the 14th century. He appears in history as traveling through Spain, England, and Holland, and in 1413 he retired to a Benedictine monastery at Erfurt. He was far before his own age in his knowledge of chemistry. He distinguished between bismuth and zinc, produced pure quicksilver from sublimate of mercury, and nitrate of quicksilver. His special investigations, however, were in relation to antimony, and the results he attained were accepted as ultimate for at least a century. He discovered muriatic acid, ammonia, fulminating powder, sugar of lead, and formulated the earliest method of quantitative analysis. His works remained unpublished until (1677) a couple of centuries after his death, but they were known to Theophrastus Paracelsus, who appropriated as his own discoveries some of the scientific secrets which they revealed.

Valera y Alcala Galiano, Juan, hoo-än' vā-lā'rā ē āl-kā-lā' gā-lā-ä'nō, Spanish statesman and author: b. Cabra, near Cordova, 18 Oct. 1824. He studied at Granada, turned from jurisprudence to a diplomatic career, and was secretary of legation successively at Naples, Lisbon, Rio de Janeiro, Dresden, and Saint Petersburg. Then he returned to Spain and wrote for 'El Contemporáneo,' the organ of the opposition to O'Donnell. In 1859 he became deputy, and minister of commerce and agriculture. After serving as ambassador at Frankfurt, he took part in the Spanish revolution of 1868. Subsequently he was ambassador to Lisbon, Washington (1884-6), Brussels, and Vienna. He was also made a member of the senate, the council of state, and the Spanish Academy. While thus prominent in public affairs,

his best efforts were nevertheless given to literature. His verse is finely wrought, but has been criticised as the expression rather of wide culture than of poetic inspiration, and his criticisms for a certain courtesy which interferes with a clear and impartial judgment. His work in prose fiction, however, has assured him a high place not only in Spanish but in general literature. His 'Pepita Jiménez' (1874) marks the revival of Spanish fiction, and the detachment from French patterns. His work steadily improved, and he treated with equal skill dialogue and description, the short story and the long. He has been particularly praised for a "complete synthesis of gravity of matter and gaiety of manner." Among the titles of his further works are: 'Las Ilusiones del Doctor Faustino' (1876); 'El Comendador Mendoza' (1877); 'Doña Luz' (1878); 'Pasarse de Listo' (1888); 'Estudios Críticos' (1864-84); 'Nuevos Estudios' (1884); 'La Buena Fama' (1895); 'Juanita la Largo' (1896); 'Genio y Figura' (1897); 'Morsamor' (1899); 'De Rios Argentinos' (1901); 'Ecos Argentinos' (1901); 'Florilegio de Poesias Castellanas del Siglo XIX.,' Vols. I.-III. (1901-2); 'Poesias' (1858); 'Canciones, Romances, y Poemas' (1885). A collective edition appeared in 1885 in the 'Coleccion de Escritores Castellanos.' Consult Brunetière, 'La casuistique dans le roman de Juan Valera' in his series 'Histoire et littérature,' Vol. I.

Valerian, vā-lē'rī-ən (**Publius Lucinus Valerianus**), Roman emperor: b. about 190 A.D.; d. about 260 A.D. He was descended from a noble Roman family and rose by degrees to the highest offices in the state. When the Emperor Decius in 251 determined to revive the censorship Valerian was chosen by him to occupy the post, but his death in 253 interrupted the plan and Valerian was chosen emperor. His reign was of slight importance, he accomplished little to avert the impending dissolution of the empire, and was almost constantly involved in warfare against the Persians and the barbarian tribes surrounding him. In 260 he was taken prisoner by the Persians and died in captivity. He was succeeded by his son Gallienus.

Valerian, the type genus (*Valeriana*) of the valerian family, herbs or shrubs having flowers with 5-parted perianths, and funnel-shaped, short-spurred corollas, which are generally of a pale rose-color. The calyx which is rudimental when in flower, becomes a feathery pappus at the top of the fruit. The leaves are simple or pinnate, without stipules, and the small blossoms are gathered into profusely branched cymose inflorescences, usually terminal. They have a spicy, aromatic odor, very grateful in spring, and are sometimes so fragrant, as in the case of *Valeriana sitchensis* and *V. officinalis* as to suggest heliotrope. The latter species is the common, or great wild valerian, which is cultivated in gardens for its flowers and its root. It has an erect stem, from 2 to 5 feet tall, with pinnate leaves and toothed leaflets, and very fragrant flowers in pale tones of lavender, pink, and white. The ascending rhizome, with many fibrous roots, has a peculiar, pungent and most disagreeable odor, due to the volatile oil of valerian contained in it, which grows stronger and worse when old. The taste is bitter, and like camphor, and the root is an official drug, which is a stimulant and anodyne, used in hys-

VALERIANOS — VALETTA

teria, and as an antispasmodic. Cats are very fond of the odor of valerian, and tear the plant to pieces and roll in it for very joy. They are said even to dig up the roots and devour them. A bit of the root is also used as a bait for catching rats. The carrot-like roots of *Valeriana edulis*, a tall glabrous plant of the western United States with undivided stem leaves, and yellowish-white flowers in elongated panicles, are eaten by the Indians either raw or dried. The Pah-Utes even grind it into flour and use it in the form of bread or mush. Nard is a name given to various species of valerian, but particularly to the *V. cellica*, employed by Eastern nations as a substitute for spikenard in their scented baths; it is, likewise, called Celtic spikenard, and, like the Cretan spikenard (*Valeriana phu*), has medicinal properties similar to, but weaker than, the official valerian. The Greek valerian is *Polemonium caruleum*, mistaken by old herbalists for the valerian described by the ancient Hellenes, and the name has been applied to the whole genus, including the creeping American *P. reptans*, with delicate nodding corymbs of pale blue flowers. *Centranthus ruber* is the scarlet lightning or spurred or red valerian, cultivated for its oblong panicle of scarlet flowers. The African or Algerian valerian (*Fedia cornucopiae*) is used as a salad plant in Algeria. It is low, glabrous and branching, with oval leaves, and tubular, long, pink flowers. It can be cultivated and eaten like corn salad, but is not so hardy.

Valerianos, vā-lē-rī-ā'nōs, Apostolos. See FUCA, JEAN DE.

Valeric or Valerianic Acid, $\text{C}_8\text{H}_8\text{COOH}$. Four acids of this composition are known. The one ordinarily known by this name is a monobasic acid found free and as ethereal salts in the animal and vegetable kingdoms, chiefly in valerian and angelica roots. It may be made artificially by the oxidation of ordinary amyl alcohol by chromic acid mixture. It is a colorless oily liquid, lighter than water, and possessed of a peculiar odor and a sharp acrid taste; somewhat soluble in water but very easily so in alcohol; unites with bases to form salts called valerates or valerianates and with alcohols to form ethereal salts. These latter are frequently of a rather agreeable odor and taste and for such are much used in the preparation of artificial fruit essences. Some of the metallic valerianates are used in medicine because of their slight sedative action.

Valerius Antias, vā-lē-rī-ūs ān'tī-as, Roman historian. He lived in the middle of the 1st century of our era and his work was an account of Latin history from the founding of Rome, and comprised 37 books. It abounds in exaggeration and fabulous incident. The author draws largely on Livy, as far as that author extends. The disjected remains of Antias are published in Peter's 'Historicorum Romanorum Fragmenta' (1883).

Valerius Cato, kā'tō, Publius, Latin poet. He appears to have been born in Cisalpine Gaul in the 1st century B.C. During the dictatorship of Sulla, and the confusion caused by the proscriptions, he lost his estate, being then in his minority, and went to Rome as a needy student, although his talent as a critic and grammarian of the Alexandrian type eventually won him

credit and distinction. Two poems, 'Diræ' and 'Lydia,' which long passed under Vergil's name, have been attributed to him on somewhat doubtful evidence. Consult Ribbeck, 'Appendix Vergiliana' (1895).

Valerius Corvus, kōr'vūs, Marcus, Roman general: b. about 371 B.C., d. about 271. In 349, being military tribune under Camillus in his campaign against the Gauls, he accepted the challenge of a gigantic warrior to single combat, and killed his antagonist with the assistance of a raven which perched upon the helmet of Valerius and as often as he advanced upon his foe flew at the Gaul's face. A general battle then ensued, in which the Romans were completely victorious. From this circumstance Valerius was considered one of the greatest of Roman heroes and was given the surname of Corvus (a raven). He was made consul the next year, and the same honor was conferred upon him five times afterward. In his third consulship, at the age of 29, he gained two victories over the Samnites at Mount Gaurus and at Suessula. In 342 he was appointed dictator on his quelling through his personal popularity a mutiny in the army. He was dictator again in 301, when he defeated the Marsi and Etruscans. He held curule dignities 21 times, repeatedly enjoyed the honors of a triumph, and is referred to by the Roman writers as an example of the favors of fortune.

Valerius, Flaccus Setinus Balbus, flāk'ūs sē-tī'nūs bal'būs, Caius, Latin poet: b. Padua, lived in the time of Titus and Vespasian; d. about 90 A.D. He wrote and dedicated to Vespasian the 'Argonautica,' a poem in eight books, in which he narrates the adventures of Jason and his companions. This epic he left unfinished. He is merely a somewhat free translator of Apollonius Rhodius, whose work he tricks out with rhetorical flourishes, while in some passages he is so obscure as to be nearly unintelligible. Consult Langen, 'Valerii Flacci Argonautica cum notis' (1896).

Valerius Maximus, māk'sī-mūs, Roman author, of the 1st century A.D. Nothing is known of his life except that he accompanied Sextus Pompey into Asia. His name is appended to a collection of historical anecdotes entitled 'De Factis Dictisque Memorabilibus Libri IX,' which embraces a large variety of subjects, and as a historical authority is of some value. Abridgments were made by Titus Probus, Julius Paris, and Januarius Nepotianus. Those of the two last named were discovered by Cardinal Mai in the library of the Vatican. Appended to the work of Valerius Maximus is a fragment entitled 'De Nominibus Prænominibus, Cognominibus, Agnominibus, Appellationibus, Verbis,' of which the first chapter only is extant. It professes to be an epitome made by Julius Paris, but probably had no connection with the work of Valerius. The best editions of Valerius Maximus are those of Torrenius (1726); Hase (1822); Kemp (1854); Halm (1865). The work was translated into English by Speed (1698).

Valerius Probus. See PROBUS, MARCUS VALERIUS.

Valetta, vāl-lēt'tā, a fortified Mediterranean seaport, capital of Malta (q.v.), on the northeast coast of the island, picturesquely sit-

VALETTE — VALLADOLID

uated on an elevated peninsula, with a large and commodious harbor on each side. The streets are narrow, the squares are spacious and handsome, and the splendid quays are lined with elegant buildings. Owing to the inequality of the site the different streets connect by flights of steps. The cathedral, built in 1580, contains the tombs of the Knights of Malta, who are represented in white marble in full costume. The governor's residence, the ancient palace of the grand masters, has a corridor hung with portraits of knights, and an armory rich in trophies and ancient armor. A library and museum, a university, a botanical garden, a military hospital, occupying a noble building erected by the knights, and other public institutions, are notable features. There are several dry-docks, and the town is an important coaling station. It has a stone quarry, silk factories, a large transit trade, and is the chief station of the British fleet in the Mediterranean. Pop. (1900) 61,268.

Valette, Jean Parisot de la, zhǒn pǎ-rě-sō dē lǎ vǎ-lět, French soldier: b. Toulouse 1494; d. Valetta, Malta, 28 Aug. 1568. He came of a noble family of Toulouse, early entered the order of the Knights of St. John, and was elected grand master of that order in 1557. His after career was a series of exploits in warfare with the Turks, ending with his renowned defense of Malta, lasting from 18 May 1565 till 8 September. The Turkish armament included 159 war ships and 30,000 men; while the defenders were 8,500 men, with 700 knights, who held the fortifications heroically in spite of awful loss and privations, till the siege was raised on the approach of a Neapolitan fleet. Valette was the founder of Valetta (q.v.).

Valhalla, the Pantheon, or Temple of Fame, built by Louis I. of Bavaria, at Donau-stauf, near Ratisbon, and consecrated to all Germans who have become renowned in war, statesmanship, literature and art. Also applied generally to buildings dedicated to national heroes, or the distinguished dead in various fields. See TEMPLE OF FAME.

Valise. See TRUNK.

Valkyries, vǎl-kí'rěz ("Battle-maidens"; "Shield or Wish-maidens"), in Norse mythology, beautiful and alluring women who ride through the air clad in gleaming armor and jewels of gold, lead the battle and select the Val or Einherjar, single champions worthy of Wodin, and of entrance into Walhalla. From the manes of their horses (the clouds) cords are trailing and the points of their spears scatter sparks of light. They lead the fallen heroes to Walhalla and offer them there the drinking horn. Sometimes they are of supernatural origin; sometimes the daughters of princes; they can change themselves into swans at will. They sometimes take noble heroes to be their lovers. Brunhilde in the heroic poetry of the north is a Valkyrie. Most of the names of the Valkyries contain some reference to war and battle. (See SCANDINAVIAN LANGUAGE AND LITERATURE.) Consult Golther, 'Der Valkyrienmythus' (1889).

Valla, vǎl'lǎ, **Laurentius** (LORENZO DELLA VALLE), an Italian humanist: b. Rome 1407; d. there 1457. He studied Greek and Latin under Bruni and Arispa, took orders in 1431, and was

appointed professor in the University of Pavia the same year. Subsequently to 1433 he held the same office in Milan, Genoa, and Florence, and in 1442 became secretary to Alfonso V. of Naples. Pope Nicholas V. summoned him to Rome, and made him secretary and apostolic writer (1447); and he passed his remaining years in translating from the Greek, and in furious literary feuds with Poggio, Trapezuntios, and others among his compeers. He was a born controversialist and reckless in the utterance of his views. He condemned moral standards of ecclesiastical asceticism in his 'De Voluptate Dialogus' (1431); he assailed the scholastic logic of the Middle Ages in his 'Repastinatio Dialectices'; the use of unclassical words and idioms in Latin writing was criticised in his 'Elegantiae Latini Sermonis' (1471); and the claims of the papacy to temporal dominion were attacked in his 'De Falso Credita et Mentita Constantini Donatione Declamatio' (1440). He wrote numerous other tractates of a destructively critical character, and made himself especially obnoxious to the professors of the current theology by his 'Annotationes in Novum Testamentum' (afterward edited by Erasmus), in which he attacked with much acrimony the Vulgate's translation of the Gospels and Epistles. His translation of Thucydides and Herodotus into Latin are not without authority at the present day. Consult: Barozzi and Sabbadini, 'Studi sul Panormita e sul Valla' (1891); Mancini, 'Vita di Lorenzo Valla' (1892); Wolff, 'Lorenzo Valla, Sein Leben und seine Werke' (1893).

Vallabhacharya, vǎl-lǎ-bǎ-kǎ'rě-ǎ, a Hindu religious reformer. He flourished in the 15th century, and his followers are most influential at the present day. He is regarded as a Mahatma, or incarnation of Vishnu; and his descendants, under the title of Maharajah or Gosain, are treated with almost divine honors. He inculcated the worship of Vishnu by his name of Krishna, in which form the god like the Greek Zeus did not disdain the love and company of mortal maidens. The worship of Krishna has a tendency to licentiousness, and a reaction toward a more spiritual and exalted creed set in under Swami Narayan about 100 years ago. Consult: Mulji, 'History of the Sect of Maharajahs or Vallabhacharyas in Western India' (1865); Williams, 'Hinduism' (1877).

Valladolid, vǎl-yǎ-thō-lěth', Mexico. See MORELIA.

Valladolid, Philippines, pueblo, province of Negros Occidental; on the west coast on Guimaras Strait, 16 miles south of Bacolod. Pop. 14,000.

Valladolid, Spain, (1) Capital of the modern province of the same name, a garrison town, and archiepiscopal see, on the left bank of the Pisuerga, a tributary of the Douro, at the confluence of the Esgueva (largely covered in) from the east, and the Canal of Castile from the north, 110 miles by rail northwest of Madrid. It is situated in a spacious, fertile plain, and has fine streets and squares. The Plaza Mayor or de la Constitución is the centre of the city's life. The cathedral, begun in late Renaissance style in 1585, is still unfinished; the most interesting church is that of Santa

VALLADOLID LA NUEVA — VALLENTINE

Maria la Antigua, dating from the 12th century. Close to these two edifices stands the university, a 17th century building, with a library. Other noteworthy buildings and institutions are: the Colegio de Santa Cruz, a splendid plateresque building of the 15th century, containing a museum and some modern paintings; the Colegio de San Gregorio, a 15th century building, now devoted to municipal purposes, with a splendid Gothic façade; the 13th century church of San Pablo, with an ornamental Gothic façade; the royal palace, dating from the 17th century; the Convent of San Benito, now used as a barracks; two theatres; a bull-ring; general hospital, etc. The Campo Grande is the finest park of the city. The industries include iron-founding and manufactures of cloth, silks, paper, gold and silver wares, chemicals, and leather. Valladolid was the capital of Spain before Madrid. It is the birthplace of Philip II., and it contains the house in which Columbus died. One of the foreign institutions for the training of Scottish Roman Catholic priests was formerly situated here. Pop. (1900) 70,951. (2) The province has an area of 2,922 square miles, and a pop. (1900) 278,561.

Valladolid la Nueva, lä nwä'vä, Honduras. See COMAYAGUA.

Vallandigham, Clement Laird, American politician: b. New Lisbon, Ohio, 29 July 1820; d. Hamilton, Ohio, 17 June 1871. He was educated at Jefferson College, Pa., taught school in Maryland two years, studied law, and was admitted to the bar in December 1842. More inclined to a political than legal career, at 25 he became the representative of Columbiana County in the legislature of Ohio, the youngest member then on the roll. In 1847 he removed to Dayton, Ohio, which he made his permanent home, and took charge of 'The Empire,' a Democratic newspaper, which he edited with marked ability for two years. He returned to his profession in 1849, but still looked forward to political leadership, and read the best political addresses and made a study of elocution and oratory, that he might fit himself for a successful political career. He was a candidate for Congress in the Dayton district in 1852, and again in 1854, but was defeated at both elections by the Hon. L. D. Campbell. In 1856 he ran for Congress a third time against Mr. Campbell. The election was contested, but upon trial by the House of Representatives he was declared elected by a majority of 23. He soon became a conspicuous member of the House; was re-elected in 1858, and was in Congress at the outbreak of the Civil War. He strenuously opposed the war as being unnecessary and unconstitutional, and his opposition was radical and persistent.

Failing of election to Congress in 1863, he returned to Ohio, and at political meetings opposed and denounced the government, and the war policy in such bitter terms, that he became the most prominent leader of the so-called "Copperheads" of the North. His extreme opposition to the war led to his arrest in May 1863 at Dayton, by General Burnside, commanding the military department of the Ohio. He was tried by a military commission at Cincinnati, Ohio, for disloyal utterances and conduct, found guilty, and sentenced to close confinement during the war, but President Lincoln commuted

the sentence to banishment beyond the Federal lines, and he was sent south through General Rosecrans' camp at Murfreesboro into the Confederate lines. Being unwilling to espouse the cause of the Confederacy and dissatisfied with his reception in the South, in a short time he ran the blockade from Wilmington, N. C., and proceeded by sea to Halifax, and later to Windsor, Canada, where he made his home for a time. While at Windsor he was nominated by the Democrats of Ohio for governor, against the Hon. John Brough, and was defeated by over 100,000 majority. In 1864 he returned to his home at Dayton without molestation, and took an active part in various political campaigns in Ohio, becoming a delegate to the National Democratic Convention at Chicago.

His tragic death occurred while he was engaged as attorney in an important murder case. He was illustrating to the jury the manner in which the victim was shot, when by accident he fatally shot himself with the pistol he held in his hands. Vallandigham was an accomplished and forcible speaker. His style was formed from the best models of oratory. His convictions were strong and inflexible, his integrity and courage undoubted. Consult J. L. Vallandigham, 'Life of Clement L. Vallandigham' (1872).

GATES P. THURSTON,
Tennessee Historical Society.

Vallejo, vä-l-yä'hō, Cal., city in Solano County; on Napa Creek, an arm of San Pablo Bay, and on the Southern Pacific railroad; about 28 miles northeast of San Francisco, and opposite Mare Island Navy Yard. The city was founded in 1851 and was intended for the capital of the State. The legislature held sessions here in 1851, 1852, and 1853, but only a part of the session of 1853 was held in Vallejo. In 1866 the city was chartered. It is in a fertile agricultural section and near by is a quick-silver mine. The chief manufactures are flour, leather, cement, canned fish, lumber products, and canned fruits. In 1900 (government census) there were 64 manufacturing establishments with a capital invested of \$446,606 and an annual output valued at \$736,629. Mare Island Navy Yard, where about 2,000 men are employed, contributes to the prosperity of the city. The principal buildings are the city hall, the Sailors' Club House, the church and school buildings. The educational institutions are two high schools, one public, founded in 1870, the other Saint Vincent's Academy (R.C.), public and parish elementary schools, and Carnegie Free Library. There is one Home for Orphans. The city owns and operates the waterworks. The government is administered by a mayor, who holds office two years, a board of city trustees, and a board of public works. Pop. (1880) 6,343; (1900) 7,965.

Val'lentine, Benjamin Bennaton, "FITZ-NOODLE," American journalist and dramatist: b. London, England, 7 Sept. 1843. He studied for the English bar and coming to this country was one of the founders of 'Puck,' and its editor 1877-84; and dramatic critic of New York *Herald*. He is the author of 'The Fitznoodle Papers'; 'Fitznoodle in America'; and such plays as 'A Southern Romance'; 'In Paradise'; and 'Fritz in New York.'

VALLEY CITY—VALLISNERIA

Valley City, N. D., city, county-seat of Barnes County; on the Cheyenne River, and on the Union Pacific and the Minneapolis, St. P. & S. Ste. M. R.R.'s; about 55 miles west of Fargo. It is in an agricultural and stock-raising region. The industries are connected chiefly with farm products and the shipment of live-stock, and the city is a distributing centre for quite an extensive region. The educational institutions are the State Normal School, public graded schools, and a school library. The two banks have a combined capital of \$75,000 and deposits amounting to \$519,690. Pop. (1890) 1,089; (1900) 2,446.

Valley Falls, Kan., city in Jefferson County; on the Kansas City N., the Union P., and the Atchison, T. & S. F. R.R.'s; about 30 miles west of Leavenworth and 26 miles north of Topeka. It is in a fertile agricultural region. The river furnishes excellent water-power, and the chief manufactures are flour-mills, machine shop, and agricultural implement shop. There are two state banks. Pop. (1890) 1,180; (1900) 1,078.

Valley Forge, Pa., village in Chester County; on the Schuylkill River, and on the Philadelphia & R. railroad; 24 miles west of Philadelphia. Valley Forge is noted as the place where Washington and his army of about 11,000 men went into winter quarters, 17 Dec. 1777, after the occupancy of Philadelphia by the British. The army suffered cold and hunger on account of the poverty of the country, but perhaps more from the incompetency of the commissary department. Despite the consequent illness of many of the men, Baron Steuben, who had been made inspector-general of the army, drilled and trained the soldiers and re-organized the army. Washington was at Valley Forge when he received the news of the consummation of the alliance with France. Washington abandoned the camp 18 June 1778, and again took possession of Philadelphia.

In 1893 the Pennsylvania Legislature took steps to acquire and preserve Valley Forge as a public park and historic landmark. On 19 Oct. 1901, a monument was here unveiled by the Daughters of the Revolution in memory of the soldiers who died in camp during the winter of 1777-8. The entire field at Valley Forge is practically the same to-day as it was when evacuated by Washington in 1778. The trenches thrown up by the "ragged Continentals" may still be seen. The old stone house which Washington used for his headquarters is standing and is in a good state of preservation. In 1903 the matter of making Valley Forge a State park was again taken up by the legislature of Pennsylvania, and the sum of \$74,500 was appropriated for the purpose. To the 210 acres already owned by the State 800 acres were added.

Valley Quail. See QUAIL.

Valleyfield, or Salaherry de Valleyfield, Canada, a town and port of entry in Beauharnois County, on the Saint Lawrence River, and at the head of Beauharnois Canal constructed past the Saint Lawrence rapids, 30 miles by the Grand Trunk Railway southwest of Montreal. The river here is crossed by a splendid railway bridge. Valleyfield is the see of a Roman Catholic bishop, and has a cathedral, college, and other fine public institutions. The town is elec-

trically lighted, has abundant water power, waterworks, and flouring-, paper-, and cotton-mills, one of the latter establishments employing 1,500 persons. Pop. (1891) 5,516; (1901) 11,055.

Valleys, in general, depressions of some magnitude in the surface of the land. Two great classes of valleys may be recognized,—(1) structural, and (2) erosional. The former include depressions due to folding, such as synclines; basins due to subsidence of an area such as might occur in regions of subterranean drainage, or in volcanic regions; fault valleys which when narrow gorges, like that of the Rhine, are known by the term of "graben," and others. Erosion valleys embrace by far the more common types, such as river-valleys, which range from gorges with vertical sides and completely filled by the river, to depressions many miles in width, with flat bottoms and gently sloping sides. The larger valleys of this type are generally found along the border line between ancient more or less disturbed, and more modern coastal plain strata which lap up against the older ones. By continued erosion the edge of the newer strata is pushed further and further away from the older land, until a valley of great width is produced along the strike of the strata. Valleys of this type are well developed along the Atlantic coast, next to the crystalline rocks of the Piedmont district. Some valleys of this type have suffered drowning, as appears to be the case in Long Island Sound. Other valleys of this type have become filled with water and transformed into lakes by the stopping up—by glacial drift or warping of the land of their outlets. Such is the case with the valleys now holding the water of some of our Great Lakes, notably Ontario. Valleys due to glacial erosion are not uncommon, although it is probable that glaciers do little more than deepen valleys originally formed by streams. A type not included in the two divisions mentioned, is found in intra-morainal valleys within the glaciated region. Here the valley is the remnant of the plain around which hills of glacial drift are built. See MOUNTAIN; FLOOD PLAINS.

Vallisneria, the typical genus of the tape-grass family. It is composed of aquatic plants, *V. spiralis* being the tape-grass or eel-grass, whose long submerged leaves are detested by swimmers; in Chesapeake Bay it is the "wild celery," upon the roots of which the canvas-back feeds, and to which are due the admirable flavor of that duck. The leaves are very long and narrow, and float just under the surface in shallow water, the plant being rooted in mud or sand. It spreads widely by stolons, so that it often forms a wide belt along the shore, which is a great refuge for the small fry of water-life, but greatly impedes the passage of boats. *Vallisneria* is peculiar in its arrangements for cross-fertilization. The leaves are arranged in fascicles, from the axils of which spring the flowers, only one sex on each plant. They are enclosed in a kind of bladder formed by two membranous, concave bracts. There is only one pistillate flower to a bladder, and when ready for fertilization, the envelope splits and frees this flower, its ovary elongates, and it is pushed upward by the growing stalk, until the whorl of three lanceolate sepals floats on the surface.

VALLOMBROSA — VALPARAISO

Above them are three abortive-petals, and three stigmas, bi-lobed at the apices, and fringed on the edges. They project slightly between the sepals. In the meantime, the bladder about the staminate flowers, which are numerous, on a short axis, and have never risen far above the mud, becomes disrupted, and the flowers, which are globular, and have their three sepals closed tightly over the stamens, float like bubbles to the surface. There they drift about, and soon open. The arched sepals become reflexed, until they look like three boats tied close together at one end. Two stamens project obliquely from the point of union, tipped with masses of sticky pollen-cells. These tiny crafts are blown about by the winds, and carried by currents, on the surface of the water, sometimes covering it as with a creamy film. In the course of their travels, they almost inevitably strike against the waiting pistillate flowers, riding at anchor, with their three stigmas poised at exactly the angle to allow their fringes to detach the sticky pollen-masses from the other flower. As soon as the pollen adheres firmly to the stigmas, the pistillate flowers are withdrawn beneath the surface by the contraction of the long stalks, which assume a spiral form, and ultimately ripen fruit near the muddy floor of the stream.

HELEN INGERSOLL.

Vallombrosa, vāl - lōm - brō'sā (Italian, "shady valley"), Italy, a celebrated abbey situated in a thickly wooded valley of the Apennines, about 18 miles southeast of Florence. It was founded by San Giovanni Gualberto about 1038, subject to the rule of Saint Benedict, and the institution was approved by Pope Alexander II. in 1070. The original purpose of the founder was to establish separate hermitages, but a monastic mode of life soon began to prevail. The Order of Vallombrosa was strictly contemplative, was the first to admit lay brethren, and established 60 branch houses in Italy and France. The abbey acquired celebrity from its romantic situation, and its magnificent buildings were erected in 1637. It was a place of refuge for French priests during the first revolution; in 1808 it was pillaged by Napoleon. It was appropriated in 1866 by the Italian government and the building is now occupied as a school of forestry, although some monks still reside here and attend to the meteorological observatory established in 1654. The place is much visited on account of its fine scenery and the views it commands, and there are hotels for the accommodation of visitors. Vallombrosa has been celebrated by Dante and Ariosto, and the Miltonian quotation "thick as autumnal leaves that strew the brooks in Vallombrosa" is well known.

Valois, vāl-wā, **House of**, a younger branch of the Capetian dynasty, which occupied the throne of France from 1328 to 1589. On the death of Charles IV., the last of the direct line of Capetians, his cousin Philip of Valois, the grandson of Philip III. and great-grandson of Louis IX., was acknowledged king as the next male heir. His direct successors were John (1350-64), Charles V. (1364-80), Charles VI. (1380-1422), Charles VII. (1422-61), Louis XI. (1461-83), and Charles VIII. (1483-98). The last named, dying without male issue, was succeeded by his cousin Louis of Orleans, the great-

grandson of Charles V., who ascended the throne as Louis XII. (1498-1515). Like his predecessor, he left no son, and had for his heir his cousin Francis of Angoulême, the offspring of a younger branch of the family of Valois-Orleans, who became King Francis I. (1515-47). After him his son, Henry II. (1547-59), and his three grandsons, Francis II. (1559-60), Charles IX. (1560-74), and Henry III. (1574-89), held the sceptre, which, on the death of the last, passed into the hands of the Bourbon family, under Henry IV. These two centuries and a half are among the most disastrous in the history of France. See FRANCE—*History*, and individual titles.

Valparaiso, vāl-pā-rī'sō, Sp. vāl-pā-rā-ē'sō, Chile, the most important seaport of the republic and a centre of trade for a large part of southwestern South America. A new interest in the future development of the city has been quite generally associated with anticipations of a route for inter-continental travel and commerce via the Panamá Canal and the Trans-Andine Railway from Valparaiso to Buenos Ayres. It is, indeed, obvious that, when the isthmian canal and the Trans-Andine Railway shall have been completed, Valparaiso will occupy an advantageous position upon the shortest route between the chief seaports of the United States and some parts of Argentina, Uruguay, and southern Brazil; that it will also, thanks to the same railway, be even more favorably situated than at present or in the past as a distributing point for European products. The natural limitations of inter-continental transportation by this route are considered and examined in the article SOUTH AMERICA (q.v.), where it is shown that the southeastern coast, at least, will continue to be more accessible from Europe than from the United States. A reasonable explanation of Valparaiso's leadership among the Pacific coast towns of South America is offered by a native author who writes: "To its progressive spirit is due the introduction of the latest inventions and processes of modern civilization. It was the first city in South America to establish telegraph lines and to adopt gas (1856), to build aqueducts for the water supply, to use street-cars (1860), etc. There, too, were begun negotiations for the construction of the Copiapó Railway, which was the first in South America (1849). Finally, there the first floating docks for the repair of vessels of large tonnage were constructed (1860)." In 1884 the drainage problem, inexcusably slighted in most Latin-American cities, was at least partially solved by the establishment of the "separate" system, the rain-water being carried directly by subterranean drains to the sea, while "the sewage waters are collected at a low point, where they are raised into a conduit which discharges at a distant place in the bay." The first device for securing a water supply dates from 1849, when a dam was built in a ravine near at hand. Recently the storage of 100,000,000 tons of rain-water for this use has been effected at a point 15 miles from the city and 1,000 feet above the level of the sea. For defense there are fortifications with modern long-range guns, and the Chilean navy has its headquarters at that port. The excellence of some public institutions—the Museum of Natural History, Naval Academy, Victoria Theatre, and hospitals; the large customs

VALPARAISO — VALVERDE

warehouses, wharf, substantial buildings for business purposes, commercial and stock exchanges, banks (seven national and a number of foreign or savings banks); more particularly the choice of subjects for conspicuous monuments that have been erected in honor of Lord Cochrane and William Wheelwright; should be mentioned as not only characteristic of the town, but also suggestive of the large obligations of the nation to Europeans, other than Spaniards, who communicated their "progressive spirit" to the Chileans during the war for independence and in the subsequent period of industrial growth. (See CHILE AND SOUTH AMERICA: sub-title *History*.) The climate is temperate. Pop. about 144,000.

MARRION WILCOX,
Authority on Latin-America.

Valparaiso, Ind., city, county-seat of Porter County; on the Chicago & G. T., the New York, C. & St. L., and the Pittsburg, Ft. W. & C. R.R.'s; about 40 miles southeast of Chicago. It was settled in 1836 and in 1856 was incorporated. It is in a fertile agricultural section, and has a large trade in farm products. The chief manufactures are mica paint, dairy products, and machine shop products. The city is famous for its large school called the Northern Indiana Normal School, and known also as Valparaiso College, a great institution founded by Henry Brown. Its courses of study are planned to meet the needs of a large number of men and women who do not find the regular college courses available. In 1903 there were about 4,000 pupils enrolled, and the regular faculty numbered 36, but there were a large number of special instructors. There are two national and one state bank, having a combined capital of \$185,000, and deposits amounting to \$987,190. The government is vested in a mayor, who holds office four years, and a common council. Pop. (1890) 5,090; (1900) 6,280.

Valpy, Abraham John, English classical scholar, son of R. Valpy (q.v.): b. Reading, Berkshire, 1787; d. London 19 Nov. 1854. He was graduated from Pembroke College in 1809, set up in business in London as a classical printer and editor, but in 1837 retired. He started the 'Classical Journal' in 1810 and conducted it till 1829, and among the chief productions of his press were a reissue of Stephens' 'Thesaurus Linguae Graecae' (1816-28); an illustrated Shakespeare (15 vols. 1832-4); and the 'Variorum' edition of the Latin classics (141 vols. 1819-30).

Valpy, Richard, English schoolmaster: b. Jersey 7 Dec. 1754; d. Kensington, London, 28 March 1836. He was graduated from Pembroke College, Oxford, in 1776. He took orders in 1777 and after acting for a few years as second master in the school of Bury Saint Edmunds became head-master of Reading grammar-school in 1781, and occupied this position with success till his retirement in 1830. He was rector of Stradishall in Suffolk from 1787, and is said to have twice refused a bishopric. He published 'Poetical Blossoms' (1772) and was widely known by his Greek and Latin grammars.

Value. There are three distinct things signified by the term value, all of which are the subject of discussion in political economy: inherent utility, cost of production, and purchasing

power. These three things, as generally recognized by economists, are distinct, and require to be represented by distinct terms; but it is equally true, though not equally recognized, that they have also in common a fundamental property which requires to be represented by a common name, and to which the term value has been assigned in established usage. The fundamental sense of value is utility estimated or measured by some standard; the meaning of the term value therefore varies with the standard implied. The standard professedly established by economists is power of purchase, but the attempt to make this the exclusive standard of value is an unfortunate one, as cost of production and practical utilities of various kinds require to be discussed in political economy as standards of value, and no other form of expression can be correctly applied to them in consistency either with common usage or with the use made of the term value as applied to purchase by political economists themselves, who are, therefore, frequently led to violate their own definition. The value, for example, of any commodity to the producer is the cost of its production, as that is the price at which he procures it; the market value, or price at which he sells it, is different, but no good reason can be given for calling one of these a value and the other not. See POLITICAL ECONOMY, *Value and Price*.

Valvassor. See VAVASOUR.

Valve (Lat. *valva*, a leaf of a double-door; plur. *valvae*, folding-doors), in mechanics, an appliance so fitted to a vessel or tube as to control the passage of liquid, gas, or vapor into, from, or through the vessel or tube. They are in general classified according to the method of their operation, and according to the mode of motion of the valve relative to its seat. In the first arrangement are: (1) Those regulated by manual power; (2) those regulated by an independent mechanism; (3) those regulated by a mechanism connected with the machine whose operation they control; and (4) those regulated by the action of the fluid. In the second arrangement, they may be described as: (1) flap-valves, which rotate on hinges in opening; (2) lift- (or puppet-) valves, consisting of a disk operated by its own weight, or by springs or rods; (3) slide-valves. Valves in musical instruments are appliances for shortening or lengthening the column of air. See VALVES AND HYDRANTS.

Valverde, val-vâr'dâ, or **Fort Craig** (N. M.), Battle of. Early in February 1862 Fort Craig, on the Rio Grande, was held by Col. E. R. S. Canby, U. S. A., with about 3,800 men, composed of detachments from three regiments of regular infantry, two of regular cavalry, two batteries of artillery officered and manned by regular cavalry, a company of Colorado volunteers, detachments from five regiments of New Mexico militia, and some unorganized militia. The fort had been greatly strengthened by throwing up formidable earthworks. In July 1861 the Confederate government, attaching much importance to New Mexico, had ordered Gen. H. H. Sibley to Texas, to organize and lead an expedition for its conquest. By the middle of November 1861 he had organized a brigade of four Texas mounted regiments and a battery, with which he marched from San Antonio, reaching Fort Bliss 14 December. Early in January 1862

VALVES AND HYDRANTS

he began his march up the Rio Grande, with about 7,000 men; and 16 February his advance was within two miles of Fort Craig, where it was met by Canby's cavalry, upon which Sibley, satisfied from the information he had obtained that with his light field guns an attack on the fort would be futile, withdrew down the river, and on the 19th he crossed to the eastern side, hoping to draw Canby out and fight him on open ground. On the 20th Canby sent a force of cavalry and artillery across the river and made a demonstration on Sibley's camp, but withdrew when his artillery opened a heavy fire. Early on the 21st Sibley made a demonstration toward the fort, while his main body pushed northward and approached the river again at Valverde. Lieut.-Col. B. S. Roberts, with cavalry, infantry, and artillery, was sent from the fort to oppose the column, should it attempt to cross the river; and before this about 500 mounted militia had been sent to watch Sibley in his camp. When Roberts arrived at the ford, seven miles above Fort Craig, Sibley had already reached the river at the opposite side, and Roberts opened the battle by sending Maj. Thomas Duncan, with regular cavalry dismounted, across the river. Duncan drove the Confederates back, the Union batteries were established on the western bank, Roberts crossed his command to the eastern side and, after some sharp fighting, by 12 o'clock drove the Confederates from all the positions they had occupied. Meanwhile the Confederates had been reinforced from their camp, and at 12 o'clock Roberts was reinforced by Capt. Selden's battalion of regulars, and Col. Kit Carson's regiment of New Mexico volunteers. Another advance was made, the Confederate guns were silenced, and McRae's and Hall's Union batteries were crossed and put in position. Canby came on the field at 2.45 P.M., bringing reinforcements from the fort, after the Confederates had been driven from all their positions to the shelter of a high ridge of sand, where, unseen, they reformed and prepared for a charge upon the two Union batteries. Sibley, who was sick, had turned the command over to Col. Green of the 5th Texas cavalry. There was a lull in the fight, which was broken by a most impetuous assault. The 4th Texas cavalry made directly for Hall's battery, on the Union right, but met with such a severe fire of canister and musketry from the supporting cavalry and infantry that, when within 100 yards of the battery, it was repulsed, with great loss, falling back in disorder. This was immediately followed by a charge upon McRae's battery by the greater part of Green's available command on foot and armed with shot-guns, squirrel-rifles, revolvers, lances, and knives. Canister and musketry made gaps in the ranks, but did not stop them, and the battery supports gave way after a close hand-to-hand fight. Capt. McRae, Lieut. Mishler, and most of the gunners were shot down beside their guns, all the horses were killed, and the guns were captured. A panic now ensued among the greater part of the New Mexico militia, but some of them, with the regulars and Colorado volunteers, were withdrawn in comparatively good order across the river, and Canby retreated to Fort Craig, unmolested by the Confederates. Sibley buried his dead, remained two days at Valverde, and moved up the river to Albuquerque. The Union loss was 68 killed, 160 wounded, and 35 captured;

the Confederate loss, 36 killed, 150 wounded, and 1 missing. Consult: 'Official Records,' Vol. IX.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Valves and Hydrants. Valves (from Lat. *valva*, leaf of a double door, plural *valvæ*, folding doors) "a cover to an aperture in a fluid-containing vessel, or a movable piece, like a door or gate, in a tube, so fitted as to permit when open, or to prevent when shut, the passage of a fluid, vapor, or gas into, from, or through the vessel or pipe." Valves may be classified according to the purposes for which they are intended to be used, namely, water, steam, oil, gas, ammonia, etc. The method by which they are operated, as (1) by hand, namely, wheel and inside or outside screw stem, slide stem and lever; (2) by mechanical devices, namely, electric motor, hydraulic or pneumatic lift; (3) by action of fluid, namely, check valves, foot valves, air valves, safety valves, relief valves, regulating valves, etc.; also they may be distinguished by the moving part of the valves, namely: "gate or straightway" valve and "globe" valve. Probably the most ancient form of valves are the leather flap valve, as shown at A, Fig. 1; and disk valve, shown at B, Fig. 1; commonly used in small pumps at the present time, and from which the present check and foot valve respectively are devised. The two most common types of valves in use to-day are the "gate or straightway" and the "globe," the former so called because of the motion of the mechanism acting as a gate in opening and closing, and permitting when open a clear and unobstructed passageway for the fluid to pass through, the latter so called from the globular form of its casings. The gate valve is made in two types, "parallel seated" and "beveled seated," or "plug," and in sizes $\frac{1}{4}$ to 96 inches, inclusive, and for all purposes, namely, water, steam, gas, oil, ammonia, etc., and for pressures varying from 1 pound to 5,000 pounds to the square inch; on these accounts they are more widely used than globe valves.

Gate Valves are usually made with bronze seats, although babbitt is used in many instances. The parallel seated gate valve with inside screw wheel type is shown in Fig. 2, the internal mechanism of which consists of the stem C, two gates G, and two beveled-faced wedges, J K, the wedges being entirely independent of the gates (or disks) and working between them. By the action of the stem, which works through the nut in the upper wedge, the gates descend parallel with their seats until the lower wedge strikes the stop (or boss) in the bottom of the case, the gates and upper wedge continuing their downward movement until the face of the bevel of upper wedge comes in contact with face

FIG. 1.

VALVES AND HYDRANTS

of bevel of lower wedge. The gates being then down opposite port, or valve opening, the face of the upper wedge moves across the face of the lower wedge, bringing pressure to bear on the backs of both gates, from central bearings, thus

commence to rise. This style of valve is called the double-gate valve and when entirely opened gives a clear and unobstructed passageway. Fig. 3 represents the same type of valve with outside screw and yoke; in this case

Fig. 2.

Fig. 4.

Fig. 5.

forcing them apart and squarely against their seats. In opening valve, the first turn of the stem releases the upper wedge from contact with

the upper end of the stem (or spindle) is threaded, and the stem is operated by a revolving nut held vertically in the yoke and turned by the hand-wheel, which is fastened to it. The stem rises without revolving, and the gates and wedges being fastened to the lower end of the stem, rises with it. The operating screw is entirely outside of the valve body where it can be inspected and oiled, and the rising stem forms the best kind of an indicator. Fig. 4 is a beveled seated gate-valve with inside screw of the double-faced solid wedge gate or plug type, in one piece, made wedge-shaped or tapering, braced or ribbed, and by the action of the stem working through the nut in the top, closes vertically between two inclined seats or surfaces in the body. To ensure perfect alignment with the stem the plug is guided by ribs or splines in the body which engage with grooves in the edges of the plug and prevent it from turning and coming into contact with its seats while opening or closing. These ribs are of unequal width to prevent the plug from being inserted wrongly after removal for repairs or otherwise. This style of valve when entirely open gives a clear and unobstructed water-way. Fig. 5, represents the same type of valve as Fig. 4, with outside screw and yoke and hand-wheel, and is operated the same as Fig. 3. Fig. 6 is a

Fig. 3.

Fig. 6.

the lower wedge, thereby instantly releasing both gates (or disks) from their seats before they

VALVES AND HYDRANTS

parallel seated gate valve operated with slide stem and lever, permitting a quick opening and closing. Fig. 7 is a gate valve with motor attached, operated with electricity. Fig. 8 is a gate valve

FIG. 7.

FIG. 8.

with hydraulic or pneumatic lift; in the former case the motive power being water to operate the cylinder, in the latter air.

FIG. 9.

Globe Valves are made with solid and renewable disks; in the former case they are of brass and in the latter of soft metal, asbestos or packing of some kind. Fig. 9 represents the most

common type of "globe valves." This valve is provided with a vulcanized asbestos disk ring. The ring is composed of the fibre of asbestos, to which is added a waterproof vulcanizing material, making a very durable packing which will not crack or flake off. It is held central on its seat by guides cast on the body of the valve. It

FIG. 10.

is also secured to the spindle without the use of nuts, screws, pins or wires. The vulcanized asbestos ring is forced into a brass holder, and the metal is spun or turned over the edges of the ring, so it cannot drop out. This valve has a raised round seat upon which, scale, grit or sediment is less likely to lodge than on the broad flat seats, sometimes used. On account of the

FIG. 11.

construction of the valve seat, as will be noted in the cut, globe valves do not permit of a clear and unobstructed passageway. Fig. 10 shows the "check stop," or as it is sometimes called "back pressure valve." This valve is used in a horizontal pipe, to prevent the backward movement of a fluid. After the fluid has raised and passed

FIG. 12.

the gate, the pressure being removed from the face of the gate, it closes, thereby checking or stopping the fluid from flowing in the reverse direction. Fig. 11 represents the "foot valve," its use and operation being similar to the "check valve." It is used, however, in a vertical pipe and at the end of the suction pipe of a pump.

Air Valves are made for two purposes, namely: to be placed on mains at high points where air accumulates and obstructs the flow of water,

VALVES AND HYDRANTS

and for use on pipe lines to permit air to enter when water is drawn off, and to allow air to escape when pipes are being refilled. The former, the "lever and float air valves," are shown in Fig. 12. When air takes the place of water about the float in the valve chamber, the float which is attached to the bronze lever drops, thus opening the small valve and allowing the air to escape. As the water returns it lifts the float, thereby

FIG. 13.

FIG. 15.

closing the valve. Fig. 13 represents the "pop-pet air valve"; when filling a line of pipe the gate remains open until the water reaches and lifts the copper float, thereby closing the gate, which remains closed while the pressure is on. Fig. 14 is an external view of a common "lever safety" valve. The valve consists of a gate with a conical edge, resting on a conical seat, and is held to its seat by the pressure of a weight acting on a lever, as shown. The "spring safety valve" is shown in Fig. 15, the spring taking the place of the lever and weight, this style of safety valve is known as the "pop safety." Fig. 16 represents a "relief valve," similar in construction to the "pop safety valve," but instead

FIG. 14.

of being used for steam is intended for use on water mains, for the purpose of relieving the pipes of water hammer, to which they may be subjected. The gate as in the "pop safety valve" is held to its seat by the pressure of a spring, which is protected, as shown in the cut, by a cast jacket, having an outlet of the same size as the inlet. The operation of the valve is as follows: When the valve is set at the pressure

desired, which is done by adjusting the hand-wheel, any excess of pressure over this opens the valve, thus relieving the mains and joints of any extra strain and doing away with the breaking

FIG. 16.

of pipes or blowing out of joints. The "regulating valve," as shown in Fig. 17, is used to control or reduce pressure in street mains and pipe lines or to regulate the flow of water between reservoirs located at different levels. This valve can be placed in any position. The friction owing to the manner of packing is but trifling, as will be readily understood by examining the cut. Valves also form the principal part of "hydrants" or "fire plugs," and are of two dis-

FIG. 17.

tinct types: "slide gate," and "compression," according to the valve motion.

Gate Hydrants.—Fig. 18 represents the "gate hydrant," which is absolutely "non-freezing," owing to the fact that the drip is positive and being in the bottom of the hydrant it drains it completely; no water being left in the barrel when the hydrant is closed, to freeze; therefore, no "outer jacket," or "frost case," is necessary. The working parts are so arranged, that by taking off the dome and packing plate, all the working parts can be removed without disturbing the barrel of the hydrant, or doing any digging. All the working parts are of solid bronze, thus pre-

VALVES AND HYDRANTS

venting rust, and the gate is rubber-faced. The operation of the hydrant is as follows: In closing, the gate is moved downward by the action

and the double or "balance gate." The compression hydrant with gate opening against the pressure is shown in Fig. 19. It will be noticed

FIG. 18.

FIG. 19.

of the stem through the threaded bronze wedge nut in the back of the gate, until it strikes a stop at the bottom of the projection in the back of the hydrant, when by the action of the bronze wedge nut, moving along the incline on the back of the gate, it is forced squarely against its seat without any grinding movement on either the rubber gasket, with which the gate is faced, or on the bronze seat ring against which it closes, the projection at the top and bottom of the gate keeping the rubber gasket away from the seat ring until it is forced squarely against it by the action of the wedge nut. The final turn of the stem, after the gate is closed and wedged, opens the drip-valve. In opening the hydrant, the first turn of the stem closes the drip valve, after which the bronze wedge nut in back of gate is loosened, thus relieving the gate from its seat.

Compression Hydrants are of three kinds. Those with the gate opening against the pressure; with the

FIG. 20.

in this hydrant that a "frost case" is necessary, and also that the drip being above the hydrant bottom it drains the barrel only, the water remaining in the bottom when the gate is closed. The thread for opening and closing the gate is in the top of the hydrant, the gate is moved downward by turning the nut or sleeve at the top of the hydrant, through which the threaded stem works. The drip is closed during the opening of the hydrant and opened during its closing, being completely opened or closed when the gate is closed or open. This hydrant's working parts are bronze mounted, and it has either a leather or rubber faced gate. Figure 20 represents the compression hydrant with a "double balanced," or "compensating" rubber valve. It is constructed with bronze working parts and like the gate hydrant has a positive drip directly in the bottom of the hydrant, permitting no water to remain in the hydrant to freeze. All its working parts can be removed without digging, and also like the "gate hydrant" the so-called "frost case" is unnecessary. This hydrant is particularly adapted for high pressures, on account of the ease in which it can be operated, and as the main valve closes both with and against the pressure no water ram or hammer can take place. In operation the upper valve opens with the pressure and the lower valve against the pressure; in closing the

VAMBÉRY—VANADINITE

conditions are reversed. The valve or double header is thus in equilibrium and can be opened or closed without effort. As the hydrant is opened, the drip or waste outlet is at once closed, the drip valve being drawn up into the bronze drip cylinder. In closing the hydrant, the drip valve is pushed out of the bronze cylinder in the flared lower end of the same. The water in the standpipe then passes out through the corrugations of the bronze guide on the lower end of stem or valve rod. Nozzles, on all hydrants, vary in number and size, according to the purposes for which they are intended to be used. For other forms of valves, see PNEUMATICS; PUMP; STEAM-HAMMER; and STEAM-ENGINE. For valves of circulation, see HEART.

JAS. H. CALDWELL,
Vice President and General Manager The Ludlow Valve Manufacturing Company.

Vambéry, vām'bā-rē, **Arminius**, Hungarian traveler and scholar: b. Szerdahely 19 March 1832. He studied at Pressburg, Vienna, and Budapest, and then went to Constantinople, where he lived by teaching French. In 1858 he published a German-Turkish dictionary, and in 1861-4, disguised as a dervish, made a journey of exploration through Persia into Turkistan, and visited Khiva, Bokhara, and Samarcand, the first tour of the kind undertaken by a European. In 1865 he became professor of Oriental languages at the University of Budapest, which position he still (1904) holds. He has written valuable linguistic works as well as volumes of travel, including 'Travels in Central Asia' (1864); 'Wanderings and Adventures in Persia' (1867); 'Sketches of Central Asia' (1868); 'History of Bokhara' (1873); 'Central Asia and the Anglo-Russian Frontier' (1874); 'Islam in the 19th Century' (1875); 'Etymological Dictionary of the Turco-Tatar Languages' (1878); 'Primitive Civilization of the Turco-Tatar Peoples' (1879); 'The Origin of the Magyars' (1882); 'The Coming Struggle for India' (1885); 'The Turkish People' (1885); 'Story of Hungary' (1887); etc. The Story of his Life and Adventures appeared in 1888. He has also been a frequent contributor to periodical literature in England, Germany, and Hungary.

Vam'pire, according to a superstitious belief somewhat prevalent in the east of Europe, Greece, Hungary, Moravia, Silesia, Poland, and Russia, the ghost or spirit of a dead person which issues forth by night and sucks the blood of living persons, particularly of the young and healthy, causing them to pine away and die. Vampires especially favor their friends and relatives with their visits, and any one whose death is caused by a vampire becomes a vampire. Among the Greeks the superstition has been so far modified by Christianity that the original vampires are supposed in many cases to be excommunicated persons, who are kept alive by the devil, and who procure their food in this and other unlawful ways. Where the belief in vampires prevails, when a person dies a careful examination is made by a skilled person lest he should have been killed by a vampire and so be liable to become one; if this is suspected, the body may be pierced with a stake cut from a green tree, the head cut off, and the heart burned. This is also the process for destroying

the vampire spirit in a corpse believed to be already a vampire. The belief has been treated by Philostratus and Phlegon of Tralles; has served a literary purpose in Goethe's 'Braut von Korinth' and the operas of Palma, Hart and von Lindpainter. Consult: Ralston, 'Russian Folk-tales'; Hert, 'Der Werwolf' (1862). See WERWOLF.

Vampire-bat, a genus of blood-sucking bats, of the carnivorous family *Phyllostomatidae*, distinguished by leaf-like nasal appendages, three joints to the middle finger and often well-developed median incisors. They inhabit South and Central America.

Owing to the inaccuracy of travelers' accounts, which ascribed blood-sucking habits to a large fruit-eating species, the effect of their attacks has been much exaggerated. The true sanguivorous vampire bat is now known to be a small species not more than three inches in length and distinguished by its trenchant and enlarged upper incisor and canine teeth, capable of slicing the skin like a razor; the very much reduced molar teeth; and the extremely narrow lumen of the alimentary canal and especially of the oesophagus, all peculiarities which adapt it to an exclusive diet of blood. This is *Desmodus rufus*, and a second closely related bat is *Diphylla ecaudata*. The former is abundant in wooded regions from southern Mexico to Chile; the latter occurs in Brazil. Bates and Wallace were themselves bitten by bats during their famous Amazon journey, and other travelers have confirmed the evidence of these naturalists.

Owing to the error above referred to the large bat mentioned is still often called the vampire, and as *Vampyrus* the name has become permanently fixed to it in scientific nomenclature. The common species (*V. spectrum*) inhabits Brazil, and is about six or seven inches in length; but the spread of the wing-membrane may measure over two feet. The body is covered with a light-brown hair. Consult Beddard, 'Mammals' (New York 1900) and the narratives of the travelers mentioned.

Van, vān, Turkey in Asia, (1) A town, the capital of a vilayet of the same name, 145 miles southeast of Erzerum, close to the east shore of Lake Van. It stands on an extensive plain covered with beautiful gardens; overlooking it is the citadel, in a ruinous condition, crowning a lofty calcareous height. Roman Catholic and American Protestant missions are maintained here. Cotton cloth is the only staple article, both of manufacture and export. Van succeeded the Ivan of Cedrenus and the Byana of Ptolemy, and the vicinity is rich in archaeological remains. Pop. 30,000 to 35,000, Mohammedans slightly preponderating over Armenian Christians. Armenian massacres occurred in 1895 and 1896. (2) Lake Van situated at a height of 5,200 to 5,460 feet above sea-level, is of irregular shape, contains many islands, and has an area variously estimated at from 1,200 to 1,500 square miles. Its water is salt, but becomes brackish near the mouths of the streams. It has no visible outlet. A kind of sardines is caught in its waters, which is salted and exported to all parts of Asia Minor.

Van'adinite, a mineral of considerable importance as an ore of the rare element vanadium. It is a chloride and vanadate of lead,

VANADIUM—VAN BUREN

$3\text{Pb}_2\text{V}^3\text{O}_8\cdot\text{PbCl}_2$. Vanadinite is a member of the apatite group and its crystals are therefore hexagonal with pyramidal hemihedrism. The prismatic crystals are sharp and smooth, or, more frequently, cavernous; sometimes they are clustered in parallel groups similar to the isomorphous mineral pyromorphite. Vanadinite has a hardness of about 3, and a specific gravity varying from 6.66 to 7.23. Its lustre is resinous to adamantine. The finest specimens (from Yuma County, Arizona) are occasionally transparent, but usually the mineral is nearly or quite opaque. The color is very variable; rich scarlet and other shades of red graduate through dark to very pale yellow, while more rarely the mineral is brown or gray. The variety endlicheite, which contains from 11 to 13 per cent of arsenic, is regarded as an isomorphous mixture of vanadinite with the lead chloro-arsenate, mimetite. It occurs in magnificent specimens in New Mexico. Other important localities of vanadinite are at Wanlockhead in Scotland, where it occurs in small, globular, crystalline masses; in Carinthia, and Argentina.

Vanadium is a rare element that is closely related to arsenic, phosphorus, and nitrogen in its general chemical behavior. Symbol V; atomic weight, 51.2; specific gravity, 5.5. It was discovered by Sefström in 1830. Vanadium is found widely distributed in nature, but in very small quantities and always in combination. The most important minerals containing it are *vanadinite* ($\text{PbCl}(\text{Pb},\text{VO}_4)_2$) and *deletoisite* ($\text{PbTn}_2(\text{OH})\text{VO}_4$). Also found in many copper, lead and iron ores. The element is obtained in the free state by heating the dichloride in a stream of hydrogen. It is a silver-colored somewhat crystalline powder that is acted on but slowly by the air at ordinary or slightly elevated temperatures, but when ignited burns brightly to V_2O_5 . Not soluble in hydrochloric or dilute sulphuric acids, but easily so in nitric, hydrofluoric, or concentrated sulphuric acids. Vanadium forms three basic oxides V_2O , V_2O_3 , V_2O_5 , and two acid oxides V_2O_4 and V_2O_6 , the last being of greatest importance. It is a reddish yellow powder that dissolves readily in alkaline hydroxides or carbonates, forming salts called vandates. These salts, like those of phosphoric acid, exist in three forms, ortho, pyro, and meta. Ammonium metavanadate is used in the manufacture of a dye called aniline black and also in the preparation of vanadium ink.

Vanbrugh, vān-broo', Sir John, English architect and dramatist: b. London 1664; d. 26 March 1726. He was educated in England and in France, entered the English army in 1686, and from 1690 till 1692 was a prisoner in France, being latterly confined in the Bastille. He acquired his knowledge of architecture during his residence in France. His first play, 'The Relapse or Virtue in Danger' was brought out at Drury Lane in 1697. 'Æsop,' founded on a French original, followed at a short interval, and in May of the same year his play of 'The Provok'd Wife' was performed. In 1700 he adapted Beaumont and Fletcher's comedy of 'The Pilgrim.' In 1702 he designed Castle Howard, the seat of the Earl of Carlisle, and produced 'The False Friend,' and later 'The Provoked Husband.' He now entered into a speculation to build a great theatre at the west end of London, in which he was his own architect. Both plays

and operas were produced; but it did not prove a success. He wrote for it the 'Confederacy,' and became charged with the erection of Blenheim Palace for the Duke of Marlborough. This work got him into considerable pecuniary trouble, as the money supplies, provided out of the civil list, were latterly stopped, and heavy claims were made against him. Ultimately the duchess took the work out of his hands, and he had difficulty in getting the money that was justly due. He built many other mansions for the nobility, for which he must have received considerable sums. From 1702 to 1711 he was comptroller of the board of works. In 1714 he was knighted by George I., in the following year appointed comptroller of the royal works, and in 1716 architect of Greenwich Hospital. Vanbrugh's plays are admirable in dramatic conception as well as in wit, but are stained with the coarse profligacy of his day. His architectural works have been praised by many, but they can only be looked upon nowadays as the most pronounced examples of the heavy English Baroco style. Consult: Ward, 'Sir John Vanbrugh' (1898); Damentzi, 'John Vanbrugh's Leben und Werke' (1898).

Van Brunt, Henry, American architect: b. Boston, Mass., 5 Sept. 1832; d. there March 1903. He was graduated from Harvard in 1854 and studied architecture. He served in the Union army on staff duty during a part of the Civil War period and subsequently practised his profession in Boston and Kansas City, Mo., and was the designer of many buildings of importance, chief among which is Memorial Hall at Harvard, a work performed with W. R. Ware. Among other buildings by him are the First Church, Boston, and the Public Library, Cambridge. He published 'Greek Lines and Other Architectural Essays' (1893).

Van Buren, vān bū'rēn, James Heartt, American Protestant Episcopal bishop: b. Watertown, N. Y., 7 July 1850. He was graduated from Yale in 1873 and from Berkeley Divinity School, Middletown, Conn., in 1876, took orders in the Episcopal Church in the year last named, and for more than ten years was rector of Saint Stephen's Church, Lynn, Mass. In June 1902 he was consecrated bishop of Porto Rico.

Van Buren, Martin, 8th President of the United States: b. Kinderhook, N. Y., 5 Dec. 1782; d. there 24 July 1862. He was the son of a farmer, attended the academy in Kinderhook, at 14 began to study law, finishing as a law student in the office of W. P. Van Ness, New York, and was admitted to the bar in 1803. Before reaching his majority he was active in political affairs, and in 1808 was made surrogate of Columbia County, N. Y. He was elected to the State Senate in 1812, in 1815-19 served as attorney-general, being also for the second time State senator in 1816. The reorganization of the Democratic party in New York in 1818 was directed by him, and he was a leading member of the Albany Regency (q.v.). In 1821 he was elected United States senator, and in the same year was a member of the convention for revising the State Constitution. In that body, while opposing universal suffrage, he advocated an extension of the franchise, and favored the proposal to require of colored persons, as a condi-

William B. Allen

VAN BUREN—VAN CORTLANDT

tion of voting, a freehold qualification of \$250. In 1827 he was re-elected to the United States Senate, but resigned in 1828 on being elected governor of New York. During his terms as senator he supported the tariff bills of 1824 and 1828, strongly favored State rights, and opposed internal improvements by the Federal government. In March 1829 he was appointed secretary of state by President Jackson, whom he had heartily supported for the Presidency; resigned in April 1831, and in September went as minister to England; but in December the Senate refused to ratify his appointment to that post, chiefly on the ground that while secretary of state he had introduced domestic party matters into foreign diplomacy. This petty action made Van Buren more popular than before, and in May 1832 he was nominated by the Democratic party for the vice-presidency, and was elected in November. In 1836 he was elected to the presidency, receiving 170 electoral votes against 73 given to W. H. Harrison, his chief opponent, and a majority of the popular vote as well. At the time of his inauguration the country had suffered from financial difficulties, and in 1837-9, following the suspension of specie payments by the banks, came a crisis which even yet is remembered among the greatest panics in American history. Van Buren established the independent treasury system for the care and disbursement of public moneys, and for this, which was at length permanently adopted, his administration is chiefly distinguished. In 1840 he was renominated for the presidency, but the financial troubles of the period were more or less charged against him and his party, and after a campaign of unprecedented public excitement he was badly defeated by General Harrison, candidate of the Whigs, Van Buren receiving but 60 electoral votes to Harrison's 234. Van Buren was brought forward again in 1844 as a candidate for the Democratic nomination, but was rejected on account of his opposition to the annexation of Texas, which was displeasing to the Southern Democrats. In 1848 he was nominated for the presidency by the Free-soil party (q.v.), and his candidacy secured the election of Taylor, the Whig candidate, against Cass, the candidate of the Democrats. With the exception of a European tour (1853-5) Van Buren passed the rest of his life on his estate at Kinderhook. On all questions save that of the extension of slavery he remained in agreement with the Democratic party to the end of his life, supporting Pierce (1852), Buchanan (1856), and voting for the Democratic electors opposed to Lincoln (1860). He wrote 'An Inquiry into the Origin and Course of Political Parties in the United States,' published by his sons in 1867. Consult: Von Holst, 'Constitutional and Political History of the United States' (1873); Shepard, 'Martin Van Buren' (in the 'American Statesmen Series' 1888); Bancroft, 'Martin Van Buren to the End of His Public Career' (1889).

Van Buren, Ark., city, county-seat of Crawford County; on the Arkansas River, and on the Saint Louis, I. M. & S., and the Saint Louis & S. F. R.R.'s; about 140 miles west of Little Rock. It is in an agricultural region and has considerable lumber interests. The chief manufactures are lumber products, canned fruits, cotton products, ice, cigars, wagons, and agricultural implements. There are one high school

and elementary schools, and one daily and four weekly newspapers. The two banks have a combined capital of \$200,000 and deposits of \$424,080. Pop. (1890) 2,291; (1900) 2,573.

Van Buren, Maine, town in Aroostook County; on the Saint John River, and on the Canadian Pacific and the Bangor & A. R.R.'s. It is in the northeastern part of the State, on the New Brunswick boundary. Van Buren was incorporated in 1881 and is an important distributing point for many of the lumber camps. It is connected by stage lines with Fort Kent, Fort Fairfield, and other places. The educational institutions are Saint Mary's College, public and parish schools, and Good Shepherd Academy. Pop. (1890) 1,168; (1900) 1,878.

Vance, vāns, **Zebulon Baird**, American politician: b. Buncombe County, N. C., 13 May 1830; d. Washington, D. C., 14 April 1894. After obtaining an education at Washington College, Tenn., and the University of North Carolina, studying law and being admitted to the bar in 1853, he established himself in practice in Asheville, N. C. The next year (1854) he was sent to the State legislature and in 1858 was elected to Congress to fill the vacancy caused by the resignation of Representative Clingman. He was opposed to secession, but at the opening of the Civil War adopted the Confederate cause and became colonel of the 26th North Carolina regiment. He was elected governor in 1862 and re-elected in 1864, and in 1870 was elected to the United States Senate, but not being allowed to take his seat there on account of his political disabilities not having been removed, he resigned in 1872. In 1876 he again became governor, and being elected to the United States Senate in 1879 retained his seat there until his death. Consult Dowd, 'Life of Zebulon B. Vance' (1897).

Vanceburg, Ky., town, county-seat of Lewis County; on the Ohio River, and on the Chesapeake & Ohio railroad; about 18 miles west of Portsmouth, Ohio. It is in an agricultural region; nearby are valuable stone quarries. The manufactures are leather, hubs, staves, spokes, flour, feed, and dairy products. The educational institutions are Riverside Seminary, public schools, and a school library. Pop. (1890) 1,110; (1900) 1,161.

Van Cortlandt, vān kōrt'lant, **Philip**, American soldier and legislator: b. Cortlandt Manor, Westchester County, N. Y., 1 Sept. 1749; d. there 5 Nov. 1831. Graduated from King's College (now Columbia University) in 1758, he began work as a surveyor, but at the outset of the Revolution received the commission of lieutenant-colonel, commanding the 4th battalion of New York infantry. In 1776 he was made colonel of the 2d New York regiment. He fought 7 Oct. 1777 at the battle of Saratoga (Stillwater, Bemis' Heights), in Sullivan's campaign against the frontier Indians, and in the Virginia campaign of 1781. He retired from the service with the grade of brigadier. A member of the New York assembly in 1788-90, he was also in 1788 a delegate to the State convention which adopted the Federal Constitution, and in 1791-4 a State senator. From 1793 to 1809 he was a representative in Congress. He accompanied Lafayette in the latter's tour of the States in 1824.

VAN COTT—VANCOUVER ISLAND

Van Cott, Cornelius, American politician: b. New York 12 Feb. 1838; d. New York 25 Oct. 1904. When a boy he operated a hand printing-press for the American Tract Society. At 15 he was apprenticed to carriage-making, which became his trade. He has been a custom-house inspector, and in 1869 became deputy collector of internal revenue. In the campaign which overthrew the Tweed Ring he took an active part. In 1883-7 and in 1881-5 was president of the New York Board of Fire Commissioners. He was elected State senator in 1888; was post-master in New York from 1889 to 1893 and from 1897 till his death.

Vancouver, vān-koo'vēr, George, English navigator: b. 1758; d. Petersham, Surrey, 10 May 1798. He entered the navy in 1771; accompanied Cook on his second and third voyages (1772-4 and 1776-9); was made 1st lieutenant in 1780; and served in the West Indies until 1789. In 1790 he was put in command of a small squadron sent to take over Nootka from the Spaniards, and was also charged to ascertain if there was a northwest passage. He sailed in the *Discovery*, 1 April 1791, spent some time at the Cape, and afterward made for Australia and New Zealand, the coast of which he surveyed. He then went north and received the formal surrender of Nootka, and spent the three summers of 1792-4 in surveying the American coast as far north as Cook's Inlet, wintering at the Sandwich Islands. On his return voyage he visited the chief Spanish settlements on the west coast of South America, and reached England in 1795. In 1798, an account of this voyage was published, with the title, '*A Voyage of Discovery to the North Pacific Ocean and round the World in the Years 1790-5*.' Vancouver Island was named for him.

Vancouver, Canada, city of British Columbia, at the western terminus of the Canadian Pacific Railway, on Burrard Inlet, in the Strait of Georgia, opposite Vancouver Island in the northern Pacific Ocean. It dates from 1885, is well laid out, has numerous good buildings, and all modern equipments, including electric street-railways, electric light, gas, and waterworks. There are extensive wharves, and Vancouver is the principal Canadian port on the Pacific with mail lines running to Alaska, San Francisco, Japan, China, and Australia. There is a large trade in lumber. Fishing is an important industry, and railway workshops, ironworks, sugar refineries, and canneries are among the numerous industrial establishments. The most interesting feature of Vancouver is Stanley Park, a public pleasure-ground 940 acres in extent, consisting of a portion of the primeval forest intersected with walks and surrounded by a 10-mile drive. This park contains some of the gigantic Douglas firs belonging to the forest that formerly covered the site of the town. An electric railway connects the town with New Westminster. Pop. (1891) 13,709; (1901) 26,133.

Vancouver, Wash., city, county-seat of Clarke County on the Columbia River, and on the Vancouver, K. & Y., and the Northern Pacific R.R.'s; about eight miles north of Portland, Ore. It has steamer connections with the Columbia River ports and with a number of the Pacific ports. It was founded in 1828 by the Hudson's Bay Company, and in 1858 was incor-

porated. It is in a region noted for its extensive lumber interests. There are many good farms nearby and considerable attention is given to raising live-stock. The chief manufacturing establishments are lumber mills, flour mills, breweries, brick works, and machine shops. The U. S. Military Department of the Columbia has its headquarters here, and the Vancouver Barracks, established in 1849, is one of the best army posts in the country. In the centre of the city is a pretty park, and the principal public buildings are the county court-house, the House of Providence, a hospital, and the schools. The educational institutions are a public high school, founded in 1889, a private high school, Providence Academy (R.C.); Saint James' College, public and parish elementary schools, a public library, and two school libraries. A United States Land Office is here. The government is administered under a charter of 1890 which provides for a mayor, who holds office one year, and a city council. Pop. (1890) 3,545; (1900) 3,126.

Vancouver Island, Canada, an island on the west coast, in the Pacific Ocean, opposite and at no great distance from the west shore of British Columbia, of which province it forms part; length, 285 miles; breadth, from 40 to 80 miles; area, about 20,000 square miles. It has no navigable rivers, but several deep arms of the sea project far inland, forming good harbors. One of the chief of these is Nootka Sound, an inlet on the west coast discovered by Captain Cook in 1778. The sound extends in a northeast direction about 10 miles inland, but in no part is it more than 500 yards broad; it embraces several islands, the largest being called Nootka, famous for the Nootka Convention of 28 Oct. 1790 which averted war between Spain and Great Britain, consequent on a Spanish seizure of British vessels at Nootka the year previously. A granite monument, on a rocky islet facing the entrance to Friendly Cove, erected in 1903, by the Washington University State Historical Society, commemorates the meeting of Quadra and Vancouver, the Spanish and British commissioners whose joint names Vancouver Island bore as a title for half a century. A mountain chain traverses Vancouver Island from southeast to northwest at an average height of between 2,000 and 3,000 feet, the highest point being Victoria Peak, 7,484 feet in the northern half of the island. The interior is rocky, often bare, but interspersed with moderately fertile valleys, with lakes and small streams, on each side of the mountain range. Coal is worked at Nanaimo, and gold, copper, and iron-ore and other valuable minerals are found. Forests are numerous, and the timber trade is important. The fruits, cereals, and roots are similar to those produced in England, and come to great perfection. Horses, cattle, sheep, and pigs thrive well. The puma, the bear, the wolf, two kinds of deer, the marten, and other fur-bearing animals, exist in the less settled parts of the island; partridges, snipes, and many varieties of wild-fowl are found. The seas and lakes abound with fish. The climate is mild and agreeable tempered by the warm Japanese current. The harbor of Esquimalt (q.v.), on the southeast coast of the island, is one of the finest in the continent, and is the chief Pacific station of the British fleet. Victoria is

VANDAL — VANDERBILT

the chief town, and the capital of British Columbia. A railway now connects Victoria with Esquimalt and the great coal-shipping port of Nanaimo, opposite Vancouver (q.v.), which is on the mainland. Pop. (1901) 50,154, including about 10,000 Wakash Indians.

Vandal, vān-dāl, **Louis Jules Albert**, French historian: b. Paris 7 July 1853. He was educated at Paris, and appointed to a professorship in the Ecole des Sciences Politiques. His first literary work was a book of travel, 'En Karriole à travers la Suède et la Norvège.' He has devoted himself mainly to writing diplomatic history, making an exhaustive study of state documents. His works in this field are distinguished for elegance of literary form as well as for accuracy in detail, and a scholarly grasp of his subject. They include 'Louis XV. et Elizabeth de Russie' (1882); 'Ambassade française en Orient sous Louis XV.' (1887); (Napoléon et Alexandre I.) (1891-3); 'L'Odyssée d'un Ambassadeur'; he has also dealt with the internal history of France in his 'Le 18. Brumaire' and 'La conquête de Paris par Bonaparte.' In 1897 he was elected a member of the French Academy to succeed Leon Say.

Vandalia, vān-dāl'i-a. Ill., city, county-seat of Fayette County; on the Kaskaskia River, and on the Illinois Central and the Terre Haute & I. R.R.'s; about 65 miles northeast of Saint Louis, Mo. It was settled in 1816, and was the capital of the State from 1818 to 1836. The city is in a fertile agricultural region in which considerable attention is given to stock-raising. The chief industrial establishments are a paper mill, foundry, tarring plant, wagon factory, manufactory of butchers' blocks, brick works, stove factory, and machine shops. The principal buildings are the old capitol, the county court-house, and several business blocks. The educational institutions are a high school, public graded schools, and a public library. The government is vested in a mayor and common council. The city owns and operates the water-works. Pop. (1890) 2,144; (1900) 2,665.

Vandals, vān-dālz, a German nation or confederation, probably allied to the Goths, who occupied at an early period the country of North East Germany on the south of the Baltic, between the Oder and the Vistula. At a later period they appear to have descended into Silesia, and occupied the country about the Riesen Mountains. In the Marcomannian war they attacked Pannonia in conjunction with the Marcomanni and the Quadi. In the reign of Constantine they had migrated or spread themselves into Moravia, whence they were transplanted to Pannonia, from which they migrated again, taking an eastward direction, into Dacia. In 406 they joined a confederate German host which crossed the Rhine into Gaul, and from thence, after Gaul had been ravaged, the Vandals found their way into Spain, in which they established themselves under their chief Godigiselus. In Galicia they contended with success with another barbaric horde of invaders belonging to the Suevi, and having vanquished a confederate army of Goths and Romans, they advanced still farther, and seized and ravaged Seville and Carthage. Under Genseric, who had newly assumed the leadership, they crossed to Africa. In 429 they vanquished the Roman governor and established a kingdom, which

spread over the greater part of the Roman possessions on that continent. Genseric immediately began to revive the maritime glories of Carthage, diligently cultivating the means of maritime warfare, and extending his conquests to Sicily, Sardinia, and Corsica. He also invaded Italy, and sacked Rome in 455. The atrocities of the Vandals on this occasion have been a favorite subject of declamation, but Gibbon shows them to have been much exaggerated. Genseric concluded a long reign in peace in 477. The kingdom of the Vandals was continued under his descendants — Hunneric, his son, who immediately succeeded him; Gundamund, 484; Thrasimund, 496; Hilderic, 523; Gelimer, 530. It was overthrown in 534 by Belisarius, the general of the eastern Emperor Justinian. The Vandals adopted the Arian faith, and persecuted the orthodox Christians. Consult: Gibbon, 'Decline and Fall of the Roman Empire'; Schmidt, 'Älteste Geschichte der Vandalen'; Procopius, 'History of his own Time.'

Vandam, Albert Dresden, English journalist: b. London March 1843. He was educated in Paris and during the Franco-German war was correspondent for several American journals. After living in London (1871-82) engaged in literary work, he became the Paris correspondent of the London *Globe* in 1882. He returned in 1887 to London, where he has since resided. He is the author of 'Amours of Great Men' (1878); 'An Englishman in Paris' (1892); 'My Paris Note Book' (1894); 'French Men and French Manners' (1895); 'Undercurrents of the Second Empire' (1896); 'A Court Tragedy' (1900); etc.

Vandenhoff, vān'den-hōf, **George**, American actor: b. England 18 Feb. 1820. He made his first appearance on the stage in England in 1839, came to the United States in 1842, and continued on the stage with great success, but in 1856 he retired, studied law, and was admitted to the bar in 1858. He afterward engaged in giving readings and as a teacher of elocution. He published: 'The Art of Elocution' (1846); 'Leaves from an Actor's Note-Book' (1860); 'Rules for Reading Aloud' (1862); etc.

Vanderbilt, vān'dér-bilt, **Cornelius**, American capitalist: b. near Stapleton, Staten Island, N. Y., 27 May 1794; d. New York 4 Jan. 1877. He was the son of a farmer, received but little school education, and at 16 purchased a ferry-boat with which he carried passengers and farm products between Staten Island and New York. Two years later he had control of three boats, and his ferry was well established. It was not long before he was extensively engaged in transportation enterprises, and he came to be popularly called "Commodore." Marrying in 1813, he removed his residence to New York. In addition to his river and harbor boats, in 1817 he built a steamer to run between New York and New Brunswick, N. J., himself acting as captain. In 1827 he leased a ferry running to Elizabeth, N. J., and afterward held interests in steamboat lines on the Hudson and on Long Island Sound. In 1851 he established a fast line to California, passengers being transferred across the Isthmus of Nicaragua. This enterprise was said to have returned him \$10,000,000. During the Crimean war, when English shipping forsook the seas, he established a steam-

VANDERBILT — VANDERBILT UNIVERSITY

ship line between New York and Havre, France. A little later he began to transfer his capital from water traffic, and entered upon a career of railroad financiering and management, buying in 1863 a great part of the New York and Harlem Railroad, afterward obtaining control of the Hudson River Railroad and of the New York Central, becoming president of the last-named in 1867. All these lines he managed with great ability, securing marked improvement in their organization and service. Having in 1869 consolidated the line of the New York Central and the Hudson River roads, he extended his system to Chicago by obtaining interests in the Lake Shore, the Canada Southern, and the Michigan Central lines. During the Civil War he presented the steamship Vanderbilt to the United States government, and for this patriotic act received a gold medal from Congress. Among his public benefactions the most noteworthy was his contribution of \$1,000,000 for the founding of Vanderbilt University (q.v.). His fortune was estimated at about \$100,000,000, the bulk of which he left to his son, William H. Vanderbilt.

Vanderbilt, George Washington, American capitalist: b. New Dorp, Staten Island, N. Y., 14 Nov. 1862. He is widely known for his establishment near Asheville, N. C., of a vast private park of 100,000 acres known as Biltmore, on which he has erected a magnificent mansion designed by William Morris Hunt (q.v.). He built and presented to New York the 13th Street branch of the Free Circulating Library, and gave the New York Teachers' College its site on Morningside Heights.

Vanderbilt University, located at Nashville, Tenn. It owes its foundation to the munificence of Cornelius Vanderbilt of New York, who in 1873 made a donation of \$500,000, afterward increased to \$1,000,000. The charter of the university was taken out in 1872 with the name of Central University, and it was to this institution that the donation of Cornelius Vanderbilt was made. In 1873 the name was changed to Vanderbilt University. The university was organized and began work in 1875 with four departments, Law, Medicine, Theology and Arts. In 1879 the departments of Dentistry and Pharmacy were added, and in 1886 the department of Engineering. These seven departments indicate the present organization of the university. The growth of the university has been made possible by continued gifts of various members of the Vanderbilt family. Wm. H. Vanderbilt, son of the founder, gave for buildings and endowment nearly \$500,000. Cornelius Vanderbilt, grandson of the founder, made similar donations amounting to \$100,000. Wm. K. Vanderbilt lately erected a magnificent dormitory accommodating 200 students, and named Kissam Hall, in honor of his mother, Maria Louisa (Kissam) Vanderbilt. A large number of gifts have also been made by others. Some of these are as follows: Mrs. Sarah E. Atkinson, for theological scholarships, \$40,000; citizens of Nashville, for grounds, \$28,000; Col. and Mrs. E. W. Cole, for lectureship and scholarship, \$12,500; Samuel Cupples, for theological department, \$21,000; alumni, for theological department, \$20,000; alumni, for academic department, \$6,000; J. G. Cartmell, for academic scholarship, \$11,000. Special men-

tion should be made of the bequest of Mrs. Mary J. Furman, of Nashville, who on her death in 1900 left the bulk of her estate to the university. It is hoped that enough will be realized to erect a laboratory or endow a chair. At present the endowment funds amount to \$1,375,000; scholarships, \$100,000; value of grounds and buildings used for university purposes, \$700,000; value of library, apparatus, etc., \$220,000; volumes in library, 35,000; annual income, \$125,000; number of students (1904), 723.

The campus of the university comprises a tract of 80 acres situated in the West End portion of Nashville and is justly celebrated as one of the most beautiful college sites in the world. It is sodded with blue grass and thickly planted with about 150 varieties of shade trees. On this campus the work of four departments is done. The departments of law, medicine, and dentistry have buildings in the city. Vanderbilt University is at present co-educational, but has never been attended by any large number of women. Only women of exceptional earnestness and unusual attainments have completed its courses and received its degrees. The literary department of the university is noted for its high standard of entrance and rigid requirements for degrees. In the beginning it was found necessary to organize sub-freshman classes, but in 1887 these were discontinued and no students were admitted below freshman grade. Entrance examinations were set at a number of points throughout the South, and independent training schools were built up in many quarters to prepare students for college. To this policy the university has consistently adhered and it has advocated the same policy as generally desirable. To promote this end, the university was the leading influence in organizing, in 1895, the Association of Colleges and Preparatory Schools in the Southern States. This association has exercised a definite and powerful influence in elevating the standard of education in the South. In the academic department two undergraduate degrees, B.A. and B.S., are given. Greek is still required for the former. The university offers a considerable number of graduate courses and has been instrumental in preparing a large number of teachers for work in school and college. Vanderbilt University has a prominent record in athletics, as is shown by the history of the Southern Intercollegiate Athletic Association, organized in 1894. The first intercollegiate track meet of the South was held at Vanderbilt in 1886.

The alumni of the university number more than 4,000, half of whom are medical graduates. The alumni are recently beginning to show an interest in the material upbuilding of the university and are making contributions for scholarships, endowment, and campus improvement. The professional departments of Vanderbilt University carry on their work under the closest possible association with the academic department. The courses in medicine and dentistry cover four years; in law and pharmacy, two years; engineering, four to six years. In connection with the theological department there has been recently organized a correspondence school for young preachers, which has in its second year enrolled nearly 500 students. There are maintained at the university the usual number of literary societies, clubs, fraternities, etc., that belong to college life. A chapter of the Phi

VAN DER GOES — VANDERLYN

Beta Kappa Society was established in 1901. The Graduate Club, Southern History Society, and Engineering Society have been active in investigations and scholarly work. Bishop H. N. McTyeire was the first president of the Board of Trust, and in that capacity the chief executive officer of the university until his death in 1889. After his death the chancellor succeeded to most of his duties and responsibilities. The first chancellor was Dr. Landon C. Garland, who was succeeded in 1893 by J. H. Kirkland, Ph.D., LL.D., who had previously held the professorship of Latin.

J. H. KIRKLAND, LL.D.,
Chancellor of Vanderbilt University.

Van der Goes, vān dēr goos, Hugo, Dutch painter: b. Ghent; d. Soignies, near Brussels, 1482. He was in 1465 a member of the Guild of Painters of his native place, serving as dean of the association from 1473 to 1475. He was a follower of Van Eyck, but most of the incidents related of his life have been rejected as fabulous. It is only known that he retired to a monastery, Rooden Klooster, in Belgium, and died insane there. The Florence triptych now in the hospital Santa Maria, a 'Madonna and Child with Angels,' is undoubtedly his production.

Vandergrift, vān-dēr-grift, Pa., borough in Westmoreland County; on the Kiskiminetas River, and on the western Pennsylvania division of the Pennsylvania railroad. It is situated in a beautiful valley and is noted for its manufacture of sheet steel, the Apollo Iron and Steel Company, now absorbed by the United States Steel Corporation, being situated here, and is one of the largest steel plants in the world, having 8 open hearth furnaces, a gigantic continuous bar mill, 29 complete sheet mills and a large plant for galvanizing the sheets. These mills employ over 3,000 men and have an output of 45 carloads of finished steel a day. The town has free mail delivery, good graded schools and a high school established in 1900; a public library and 8 churches. It has a savings bank with a capital of \$130,000, and deposits amounting to \$450,000. Vandergrift was founded by the Apollo Iron and Steel Company on 650 acres of land, upon which they erected their works in 1896 and 1897. The value of the works is estimated at \$5,500,000. The town is very remarkable as a successful demonstration of the economic principles and is known in the iron world as the "workingman's paradise." The town was laid out and sewer, and water, electric light and gas plants built, streets paved, trees planted, etc., before a single lot was sold to the employees. Nearly all the homes in the town are owned by those who live in them, and every lot of land was sold with a stipulation in the deed that no liquors should be sold on any of them for 99 years. The mills have never closed down since they were started, except at intervals for repairs. The workmen are well paid and of unusual intelligence, and belong to no labor union, and the town has never had any labor disturbances. Pop. (1903) 6,000.

Van der Helst, vān dēr hēlst, Bartholomæus, Dutch painter: b. Harlem 1611 or 1612; d. Amsterdam 16 Dec. 1670. In Amsterdam he was the pupil of Nicolas Elias. His most famous picture is 'The Banquet of the Civic Guard,' which contains 24 powerful portraits, and was painted to celebrate the Peace of

Westphalia (1648). The work is remarkable for life-like expression, masterly drawing, and clear harmonious coloring, and Sir Joshua Reynolds said of it that it was "the first picture of portraits in the world." Numerous portraits by him are met with in the European galleries; among them are that of 'Paul Potter' (at The Hague); 'The Lady in Blue' (in the London National Gallery); and the 'Dutch Burgomaster' (in the Metropolitan Museum of New York).

Van der Heyden (or Heyde), Jan, yān vān dēr hī'dēn, Dutch painter: b. Gorcum 1637; d. Amsterdam 28 Sept. 1712. After studying under a glass painter he turned his attention to architectural landscape on canvas, and taking up his residence in Amsterdam he executed many views of churches, castles, palaces, open squares, streets, canals, etc. These were enriched with elaborate figure groups, mostly painted in by Lingelbach, Van de Velde, and Eglon Van der Neer. His works are to be met with in most European public galleries. His chief pictures are 'View of the Town Hall in Amsterdam'; and 'View of the Dam Square.'

Van der Hoeven, Jan, yān vān dēr hoo'vēn, Dutch scientist: b. Rotterdam 9 Feb. 1801; d. 10 March 1868. He studied natural history and medicine at Leyden and continued his studies in zoology at Paris and returned to his native town as a practising physician, but in 1835 was appointed professor of zoology at Leyden University, a position he held till his death. He published many works on his special subject, the chief of which was 'Handboek der Dierkunde' (Handbook of Zoology, translated by Prof. Clark of Cambridge).

Van derlip, Frank Arthur, American banker: b. Aurora, Ill., 17 Nov. 1864. In his boyhood he worked on a farm and in a machine shop and was subsequently graduated from the University of Chicago. He was successively reporter on the *Chicago Tribune* and its financial editor; associate editor of the *Chicago Economist* (1894-7), and became private secretary to Lyman Gage, secretary of the treasury, 4 March 1897. His knowledge of finance and his executive ability quickly advanced him from the place of private secretary to assistant secretary of the treasury, which place he filled during the first administration of President McKinley, when he resigned to become vice-president of the National City Bank of New York.

Van derlyn, John, American artist: b. Kingston, Ulster County, New York, 1776; d. there 23 Sept. 1852. He was a pupil of Gilbert Stuart, and patronized and helped by Aaron Burr, was enabled to go to Paris in his 20th year, where he studied for five years, and there practised his profession for 12 more. His 'Marius Among the Ruins of Carthage' was awarded a gold medal by Napoleon I. Another famous picture of his is the 'Ariadne in Naxos,' now in the Pennsylvania Academy of Fine Arts. This is one of the finest nudes which have appeared in the history of American art, being simple and natural in treatment, pure and delicate in tone and line and tenderly pathetic. As a portrait painter he achieved successes not unworthy of his master Stuart. Among his sitters were Washington, Monroe, Madison, Calhoun, Clinton, Zachary Taylor, and Aaron Burr. He also painted for the last mentioned friend a portrait of himself now in the

VAN DER MEER—VAN DE VELDE

New York Metropolitan Museum of Art. Nevertheless he failed in meeting with the success and appreciation he desired, and expressed his bitter disappointment by declaring "No one but a professional quack can live in America." Poverty and discouragement appear to have crushed and paralyzed his energies, and in the autumn of 1852 he returned to his birthplace so poor that he was forced to borrow a shilling to pay for the expressage of his trunk to the town. He asked for a bed at the hotel, and next morning was found dead.

Van der Meer, vān dēr mār, Jan, of Delft. See VERMEER, JOHANNES.

Van der Meulen, vān dēr mē'lēn, Adam François, Dutch painter: b. Brussels 1632; d. Paris 15 Oct. 1690. After learning the principles of his art in the studio of P. Snayers (q.v.) he was introduced by Lebrun to Minister Colbert, who commissioned him to paint several pictures for his private gallery and made him superintendent of the Gobelin tapestry manufactory. He subsequently as court painter accompanied Louis XIV. on his campaigns in Flanders for the purpose of painting the most important scenes of the war. A great number of battle pieces, which are crowded with figures, are now in the Louvre, and in the gallery at Versailles, others are at Munich, Dresden, and Saint Petersburg. A good example of his skill as a battle painter is his 'Rencounter of Cavalry,' a small but exquisite canvas in the New York Metropolitan Museum.

Van der Poorten-Schwarz, vān dēr pōr'tēn shvārts, J. M. H., Dutch novelist. See MAARTEN MAARTENS.

Van der Stucken, vān dēr stoo'kēn, Frank, American musical director: b. Fredericksburg, Texas, 15 Oct. 1858. He studied at the Conservatory of Music, Antwerp, 1881-2, and became Kapellmeister at the Stadt Theater, Breslau, Germany. In 1884 he became leader of the Arion Singing Society of New York and in 1892 accompanied it on a concert tour through Europe. He has been dean of the College of Music of Cincinnati since 1897.

Van der Weyden, vān dēr wī'dēn, Rogier (also known as ROGER DE BRUGES, ROGER DE BRUXELLES, RUGGIERO DA BRUGIA, MAESTRO ROGEL, and ROGER DE LA PASTURE), Flemish painter: b. Tournay, Belgium, about 1400; d. Brussels 16 June 1464. He was the pupil of the painter Robert Campin in Tournay (1427), and five years later was made master of the Guild of Saint Luke in his native city. In 1436 he went to Brussels and was appointed municipal painter. He attended the Jubilee at Rome in 1450, and after studying the Italian masters and antiques of Italy and painting several pictures for Italian patrons, one of whom was Cosimo de Medici, returned to Belgium and settled at Brussels. All of his pictures are distinguished by a profoundly religious spirit. They are designed and drawn with great care and power; the modeling is firm and smooth, the technique brilliant, but there is a certain dryness and leanness in the limbs, hands, and feet of his figures, which sometimes almost amounts to distortion and deformity, and is only half redeemed by the beauty of his faces whose expression is radiant with faith and celestial inspiration. He was the founder of the Brabant school of paint-

ing and had numerous pupils and followers, among them Memling, as well as foreigners who learned from him the use of oils in painting and helped to spread the new method, and other characteristics of the Flemish studios. His chief paintings are 'The Descent from the Cross,' originally painted for the Church of Our Lady of Victories, at Louvain, now in the Escorial, a copy being also in the Prado gallery; a triptych with the figure of the 'Dead Christ' in the central panel; and altar-piece for Saint John's chapel in the church at Middleburgh; 'The Adoration of the Shepherds' (all three in the Museum at Berlin); and the triptych with a 'Crucifixion' in the centre in Imperial Gallery at Vienna; the 'Last Judgment' in the hospital at Beaune; and the 'Seven Sacraments' at Madrid. In the Pinakothek at Munich are to be seen his 'Adoration of the Three Magi'; and 'Saint Luke Painting the Portrait of the Madonna.' Consult: Wauters, 'Roger Van der Weyden, ses œuvres, ses élèves et ses descendants' (1856).

Van de Velde, vān dā vē'l'dē, Adriaan, Dutch painter: b. Amsterdam 1635 or 1636; d. there 21 Jan. 1672. He was the son of Willem Van de Velde the Elder, under whom he studied, and consequently brother of Willem Van de Velde the Younger, the famous marine painter. While he continued his training as a landscape painter under Wynants at Haarlem, P. Wouwerman taught him to draw and paint figures, and he eventually rose to be one of the most eminent of the Dutch masters. He was equally successful in history, animals, battle-pieces, genre, and portraits, but his masterpiece, now in the Museum of The Hague, is a landscape in which the figures in the foreground are portraits of himself, his wife, and children. His pictures are highly valued by connoisseurs, and 'A Pastoral Scene' (containing cows, a horse, sheep, and figures, 13¼ x 12½ inches) was sold in 1842 for \$22,575. Other important pictures of his are 'Starting for the Hunt'; 'Winter Landscape'; 'The Siesta'; etc.

Van de Velde, Willem (THE ELDER), Dutch painter: b. Leyden 1611 or 1612; d. London 1693. He was in early life a seafaring man, and settling at Amsterdam became famous for his marines in black and white, and in order that he might witness any sea-fight that should take place at a time when the Dutch navy swept the seas, the states of Holland placed at his disposal a small vessel from which he sketched and painted a great many pictures. He was appointed court painter by Charles II. of England and his successor, James II., and enjoyed a royal pension until his death. His pictures are almost all in black and white and were excelled by those of his son Willem Van de Velde the Younger, who, however, doubtless used the sketches, studies, and drawing left by his father.

Van de Velde, Willem (THE YOUNGER), Dutch painter: b. Amsterdam 1633; d. Greenwich 6 April 1707. He gained the delicate sense of color and marvelous power of atmospheric effect from De Vlieger; but his strong drawing and knowledge of marine detail, his faculty of giving motion to waves and ships he derived from his father, who was however no colorist. But while he could paint the storm, foaming waves, angry clouds, and scud-

ANTONIUS VANDYCK.

VAN DIEMEN—VAN DYKE

ding vessels he was equally successful in portraying a calm; one such picture catalogued as 'A Calm, Men-of-war at Anchor,' was sold in 1846 for \$8,820, and his canvases have always been prized by English critics and connoisseurs, by one of whom he has been styled the "Raffael of Marine Painting." There are some 330 of his works extant, some of which when last they changed hands fetched between \$10,000 and \$14,000. Little is known of the life of this painter excepting that he enjoyed a pension of £100 a year from Charles II., who was in every way his liberal patron. His portrait, by Sir Godfrey Kneller, is still in existence. Consult Michel, 'Les Van de Velde' (1892).

Van Diemen, vān dē'mēn, Anthony, Dutch colonial administrator: b. 1593; d. 1645. Having gone to India, he soon rose to the highest dignities, and in 1636 was made governor-general. He administered the government with ability, and contributed much to the establishment of Dutch commerce in India. The navigator, Abel Tasman, whom he sent with a vessel to the South Seas in 1642, gave the name of Van Diemen's Land to the island now called Tasmania, but in 1853 it was renamed for its discoverer.

Van Diemen's (vān or vān dē'mēnz) **Land.** See TASMANIA.

Van Dorn, Earl, American soldier: b. near Port Gibson, Miss., 17 Sept. 1820; d. Spring Hill, Tenn., 8 May 1863. He was graduated from West Point in 1842 and served in the American army with distinction during the Mexican War. Early in 1861 he joined the Confederate army, captured the steamer *Star of the West* at Indianola, and becoming major-general in January 1862 commanded the Trans-Mississippi district. He suffered defeat at Pea Ridge and being transferred to the army of the Mississippi was again defeated at Corinth.

Vandyck, vān-dīk', Antonis (in England, Sir ANTHONY VANDYCK, Dutch painter: b. Antwerp 22 March 1599; d. London 1 Dec. 1641. His father was a silk mercer, and his mother was skilled in embroidering landscapes and figures. At the age of 10 he became a pupil of Hendrik Van Balen, a friend of the great Rubens, and later was admitted into the studio of Rubens, and his style was formed under the influence of that master. At 19 he obtained the freedom of the Guild of St. Luke in his native city, and from an extant document dated 29 March 1620 it appears that he was nominated as assistant to Rubens in the decoration of the Jesuit church in Antwerp. How closely he followed the lead of Peter Paul may be seen from his 'Jerome' (Dresden Gallery); his 'Christ in the Prætorium'; 'The Descent of the Holy Ghost,' and other early pictures. In 1620 he was induced to visit England, where he was warmly welcomed. James I. granted him a pension, and the painter executed, though probably not from life, the full-length portrait of the king now in Windsor Castle. Returning to Antwerp, he made, by the advice of Rubens, a journey to Italy. He set out in 1621 and went by way of Brussels to Genoa, where he made a prolonged stay with a group of Flemish artists. A romantic story of his love for a peasant girl whom he met at Saventham, near Brussels, is a myth. On leaving Genoa he visited Rome, Florence, Bologna, Venice, Mantua, Palermo,

and Turin, improving his knowledge of the Italian masters, especially of Titian and Paolo Veronese. He returned to Brabant in 1626. His fame was now at its highest, and efforts were made to induce him to settle in England. These succeeded, and in 1632 Vandyck came to London. Charles received the painter with great distinction, bestowed upon him the honor of knighthood, a considerable annuity, and a summer and winter residence. Vandyck rewarded this generosity by unceasing diligence: he enriched England with his masterpieces, and executed, besides a multitude of portraits, several mythological and historical paintings. He was a man of handsome person, elegant manners, and varied accomplishments, and he lived in such an expensive style as to squander the greater part of the large sums he received for his portraits. It was his custom to invite his sitters, the highest in the land, to his house. There he would sketch the portrait in the morning, entertain his subject at a sumptuous dinner, and complete the picture in the afternoon. When he found that the gains of his art did not suffice to meet his expenditure, he sought to increase his means by the pursuit of the philosopher's stone, but this served to impair his resources still more, and gradually degraded his character by developing in him a thirst for gold. At the same time he ruined his health, and even weakened his intellect, by licentiousness. To save him from the complete degradation into which he seemed likely to fall, some of his well-wishers, the king among the number, contrived to have him united in marriage to the beautiful Mary Ruthven, a granddaughter of the Earl of Gowrie. Vandyck visited his native city with her, and went thence to Paris, where he hoped to be employed to paint the gallery of the Louvre; but as the work had been already committed to Poussin, he returned to England. Though infirm and exhausted, he proposed to the king to paint the walls of the banqueting house with the history and procession of the order of the Garter, promising to make the cartoons. But he died soon after at 43, in the year following the death of his master Rubens. In spite of his extravagant habits he left about £20,000. He was buried in St. Paul's. The principal galleries contain some of his pictures, which it is impossible to enumerate here. Though Vandyck shone in historical composition, his strength lay in portrait, in which department he was second only to Titian; and no painter ever exceeded him in the knowledge of *chiaroscuro*. In his portraits he gave a peculiar grace to his heads, and his expression was inimitable. His draperies are in a grand style, broad and simple in the folds, easy in the disposition, and the coloring lovely. In some particulars Vandyck has been acknowledged to be superior to Rubens; his touch is more delicate, his ideas are more graceful, and his expression is more true. He sometimes amused himself with engraving, and etched several plates, consisting mostly of portraits, in a spirited style. Consult: Guiffrey, 'Antoine Van Dyck, sa Vie et son Œuvre' (1877); and the monographs of Carpenter (1844); Head (1877); Michiels (1881); Knackfuss (1896); Cust (1900); and Hurl (1902).

Van Dyke, Henry (Jackson), American Presbyterian clergyman and author: b. Germantown, Pa., 10 Nov. 1852. He was graduated at

Princeton (1873), the Princeton Theological Seminary (1877), and the University of Berlin (1878); was pastor of the United Congregational Church of Newport, R. I., in 1878-83; and of the Brick Presbyterian Church, New York, from 1883 until his resignation in 1900 to become professor of English literature in Princeton University. He was moderator of the general assembly of the Presbyterian Church in the United States in 1902-3. He became favorably known as both preacher and popular lecturer, and in addition to publishing several works of religious character, contributed much also to general literature. The titles of his volumes include: 'The Reality of Religion' (1883); 'The Story of the Psalms' (1887); 'The Poetry of Tennyson' (1889; 5th revised ed. 1894); 'Little Rivers' (1895), a collection of essays; 'The Gospel for an Age of Doubt' (1896); 'The Builders and Other Poems' (1897); 'Ships and Havens' (1897); 'The Lost Word' (1898); 'Fisherman's Luck' (1899); 'The Toiling of Felix, and Other Poems' (1900); 'The Poetry of the Psalms' (1900); and 'The Blue Flower,' short stories (1902).

Van Dyke, John Charles, American art critic and librarian: b. New Brunswick, N. J., 21 April 1856. He was privately educated and in 1877 was admitted to the New York bar, but soon gave his attention to literature, and since 1878 has been librarian of the Sage Library, New Brunswick. For many years he studied art in Europe, has lectured at various universities on art topics, and is professor of art at Rutgers College. He has published: 'Books and How to Use Them' (1883); 'Principles of Art' (1887); 'How to Judge of a Picture' (1888); 'Serious Art in America' (1890); 'Art for Art's Sake' (1893); 'History of Painting' (1894); 'Old Dutch and Flemish Masters' (1895); 'Modern Flemish Masters' (1896); 'Nature for its Own Sake' (1898); 'Italian Painting' (1902); 'Old English Masters' (1902); 'The Meaning of Pictures' (1903); etc.

Van Dyke, Paul, American Presbyterian clergyman and educator, brother of H. Van Dyke (q.v.): b. Brooklyn, N. Y., 25 March 1859. He was graduated from Princeton in 1881, was pastor of the North Presbyterian Church, Geneva, N. Y., 1886-9, professor of ecclesiastical history at Princeton Theological Seminary, 1889-92, pastor of the Edwards Congregational Church, Northampton, Mass., 1892-8, and since the date last named has been professor of modern European history at Princeton University. He has published 'The Age of the Renaissance' (1897).

Vane, Sir Henry, English statesman, fourth governor of Massachusetts: b. Hadlow, Kent, 1612; d. Tower Hill, London, 26 May 1662. He studied at Magdalen Hall, Oxford, and also for a time at Geneva or Leyden; was a member of the retinue of the English ambassador to Vienna in 1631; and after his return was so decided in his opposition to the doctrine and ceremony of the Established Church that he sailed for New England to obtain freedom of conscience. With royal license permitting a three-years' residence, he arrived at Boston 6 Oct. 1635. He was at the time a joint-commissioner representing Lord Saye and Sele, Lord

Brooke, and the other patentees of Connecticut. On 1 November he was admitted a member of the church of Boston, on 3 March 1636 received the freedom of the colony (that is, was made citizen). He had already taken some part in its political affairs, having effected a conference for the adjustment of differences at which articles were drawn up for the guidance of magistrates. He was elected governor 25 March 1636. The "fifteen great ships" then in harbor, according to Winthrop ('History of New England,' ed. Savage, 1825), "congratulated his election with a volley of great shot." One of his first acts after induction into office was to make an agreement with the captains of these vessels as to the government of shipping. A difficulty arose through the request of the officers of British vessels that the king's colors might be flown from the fort. All the magistrates, with one exception, were opposed, since the flag contained the cross which Endicott had but recently cut away. Reply was made that there was no king's flag in the colony, but the captains supplied one, and it was hoisted on the authority of the governor and his supporter in the council. At the outbreak of the Pequot war Vane joined Roger Williams in influencing many Indian tribes to refrain from hostilities. On 21 October he concluded a satisfactory treaty with Miantonomo, sachem of the Narragansetts. But in his interposition in ecclesiastical matters he was far less successful. The Antinomian controversy was reaching a critical stage, and the colony was divided into two hostile camps, one holding to "sanctification" as evidence of "justification," and the "covenant of works"; the other to the "covenant of grace." The latter were in a minority and far less influential, and Vane, as a champion of free inquiry, took their side. The colonists, unfortunately did not, as Upham points out, favor such inquiry "whenever it threatened to lead to results different from their own." As a consequence, at the election in March 1637, Vane and all his supporters were left out of office. Boston, indeed, chose him to the General Court, and when the election had been declared void by the majority of the house, returned him the very next day. Winthrop was elected governor, and at once, as a means toward defeating heresy, a law was passed by the General Court that no strangers were to be received within the jurisdiction of the colony save those permitted by one of the council or two of the assistant magistrates. Discontent with this law so increased that Winthrop published a 'Defence.' To this Vane replied in 'A Brief Answer to a Certain Declaration,' a plea for toleration. On 3 Aug. 1637 he sailed for England. On his return, he labored to secure a charter for Rhode Island, and this was obtained chiefly by his influence. His services in this behalf were duly recognized by Williams. From 1639 to 1641 he was treasurer of the British navy, in 1640 entered Parliament for Hull, in the same year was knighted, and in 1641 advocated the abolition of episcopacy and was dismissed by Charles I. from the treasurer'ship. He was head of the Parliamentary war-party, was practically leader of the Commons in 1643-6, was a commissioner to treat with Charles I. at Newport in 1648, but took no part in the king's trial. Under the Commonwealth he was a leader in all affairs of state. In 1651 he was sent to

VAN EYCK—VANILLA PLANT

adjust Scottish affairs. When Cromwell forcibly dissolved the Long Parliament in 1653, Vane, who desired to continue it, was brought into open collision with him. Vane therefore withdrew to Belleau in Lincolnshire, where he busied himself with literary composition. One of Milton's sonnets (XVII.) recognizes his activity in the Commonwealth cause. In 1656 he was imprisoned for a pamphlet against Cromwell's arbitrary procedure, in 1659 re-entered Parliament, and having secured the abolition of the protectorate, was commissioner of the navy in the restored Long Parliament, from which he was finally expelled January 1660, generally distrusted by all parties. He was excluded from indemnity on the Restoration, held prisoner in the Tower and the Scilly Islands, and finally, after an able defense, sentenced to death for treason. His mystical religious views made him a puzzling character to his English contemporaries, most of whom apparently came to think him a fanatic. He was reported at one time to be the head of an Anabaptist revolt; at another, king of the Fifth Monarchy. His abilities were never questioned, but his high principles were once not seen so clearly as they now are. He appears briefly in Hawthorne's 'Legends of the Province House' (I. 'Howe's Masquerade'). Consult biographies by Sikes (1662), Upham (Sparks' 'American Biography,' 1st ser., Vol. IV., 1835), and Hosmer (1888); also Winthrop, 'History of New England' (ed. Savage 1825 or ed. 1853), and Hutchinson, 'History of Massachusetts' (ed. 1765).

Van Eyck, vān ik, Hubert. See EYCK, HUBERT VAN.

Van Eyck, Jan. See EYCK, JAN VAN.

Van Goyen, vān goi'ēn, Jan Josephszoon, Dutch painter and etcher: b. Leyden 13 Jan. 1596; d. The Hague in April 1656. His numerous landscapes and marines are to be found in most European galleries and in the Metropolitan Museum of New York, his 'Moerdyck' and 'Panoramic View of the Environs of Haarlem' are good examples of his style. His pictures are generally painted in a tone which dominates all variegations of color—a rich brown, a tawny gold, or a chilly silver tone, and he has been called the earliest "tone-painter" of the Dutch school. There is always genuine feeling in his shore landscapes, sandhills, canals, rivers and village views, while his city scenes are lit up with animated figures. His etched landscapes are rare, and he is only known to have produced five plates. Among his pupils were Jan Steen and S. Ruysdael.

Van Hise, vān hīz, Charles Richard, American geologist: b. Fulton, Wis., 29 May 1857. He was graduated from the University of Wisconsin in 1879, was instructor in metallurgy there 1879-83, assistant professor 1883-6, and full professor from the last named date, exchanging the chair of metallurgy for that of geology in 1888. He was non-resident professor of structural geology at the University of Chicago, 1892-1903, has been connected with the United States Geological Survey from 1883, and was consulting geologist of the Wisconsin Geological Survey from 1897. Among his professional publications are: 'Correlation Papers: Archean and Algonquin' (1892); 'Principles of North American Pre-Cambrian Geology' (1896);

'The Marquette Iron-Bearing District of Michigan,' with Bayly and Smith (1897).

Van Horne, vān hōrn, Sir William Cornelius, Canadian railway official: b. near Joliet, Ill., 3 Feb. 1843. He was employed in various capacities on several lines until 1880, when he became general superintendent of the Chicago, Milwaukee and Saint Paul system. In 1882 he accepted the position of general manager of the Canadian Pacific Railway, and from 1888 to 1899 served as its president. Since 1899 he has been chairman of the Board of the company. The Canadian Pacific Steamship Company was largely developed by him, and in the promotion of steamship traffic with Australia, as well as in other enterprises, he has rendered efficient services.

Vanil'la, a genus of orchids, of great economic value, on account of its fruits, which furnish the commercial flavoring-extract known by the same name. Several species furnish vanilla, the most important being *V. planifolia*, indigenous to Mexico, and adjacent territories. It is a robust high-climbing plant, living for half a century; and while not in the least epiphytic, it attaches itself to trees by adventitious roots. It bears bright-green, oval, flat leaves, which are fleshy or coriaceous. The flowers are fragrant, and greenish-white, with a trumpet-shaped lip, crinkled about the edges. When cultivated, as it is very largely, in tropical countries, especially in Mexico and Java, the flowers must be fertilized artificially, the finest being chosen, a process carried out by insects in its wild habitat. They then set fleshy fruit, which is carefully picked just before each is ripe. These pods are from six to nine inches long, and are filled with an oily pulp containing the minute seeds. They are called vanilla beans from their long, slender legume-like appearance, but are not fragrant. The characteristic aroma is due to the presence of a volatile oil (vanillin) which is developed by slow curing and fermentation. The pod, as it appears in the markets, is chocolate-colored, wrinkled, slender, and pliable. In the best qualities, or "frosted vanilla," the vanillin extrudes its needle-like crystals, forming a delicate efflorescence on the outside of the beans. Although vanilla is a carminative and stimulative drug, it is chiefly used as a flavoring substance, particularly for chocolate and confectionery. The Spaniards found vanilla in use among the Mexican Indians, in conjunction with cocoa, and it is said that it was first imported into England about 1510, when other Mexican products found their way over seas.

There are several inferior qualities of vanilla, such as the Venezuelan and Brazilian varieties, brought from those countries, the latter being distinguished as vanillon, and supposed to be the product of *Vanilla Pompona*. The pods are longer and thicker than those of *V. planifolia*. Guiana vanilla pods (*V. guianensis*) are coarse and frequently split open.

HELEN INGERSOLL.

Vanilla Grass. (*Savastana odorata*). See GRASSES IN THE UNITED STATES; SWEET GRASS.

Vanilla Plant, a tall herb (*Trilisa odoratissima*), with tubular magenta-hued flowers in spreading corymbose panicles, growing in the southern United States. The foliage when dried has the odor of vanilla, and the leaves are used

by the Southern negroes to scent their houses. The vanilla plant also serves to improve the flavor of fine-cut tobacco.

Vanini, vā-nē'nē, Lucilio, Italian free-thinker: b. Taurisano about 1585; d. 19 Feb. 1619. At Naples and Padua he studied the new learning of the Renaissance and the newer learning of physical science, qualified as doctor *utriusque juris*, and took orders as priest. But his "naturalist" views, which were regarded as atheistic, soon brought him into collision with the Church. He taught in France, Switzerland, and the Low Countries, and fled from Lyons to England, where he was imprisoned. Later he went to Toulouse, where he was arrested and condemned to have his tongue cut out, to be strangled, and to be burned to ashes. He was burned on the day of his condemnation. His 'Amphitheatrum Æternæ Providentiæ' (1615) and his 'De Admirandis Naturæ Arcanis' (1616) set forth his pantheistic opinions. As an independent thinker and in the doom which he suffered he has many points in common with Giordano Bruno (q.v.), although as a philosopher he has no claim to be ranked with him. Consult: Owen, 'Skeptics of the Italian Renaissance' (1893) and monographs by Fuhrmann (1800), Vaisse (1871), and Palumbo (1878).

Vanishing Fraction, in mathematics, a fraction which reduces to the form $\frac{0}{0}$ for a particular value of the variable which enters it, in consequence of the existence of a common factor in both terms of the fraction, which factor becomes 0 for this particular value of the variable. See FRACTIONS.

Vanishing Point, that point to which all parallel lines in the same plane tend in the representation.

Vanity Fair, a novel by W. M. Thackeray, first published serially in 1847-8. As the subtitle states, it is "without a hero"; but not, however, without a heroine. The central figure of the book is the immortal, inimitable Becky Sharp, the transcendent type of social strugglers, the cleverest, most unimoral woman in the whole range of fiction. The environment in which she is placed is the fashionable England of the beginning of the 19th century.

Van Len'ep, Henry John, American missionary: b. Smyrna, Turkey, 18 March 1815; d. Great Barrington, Mass., 11 Jan. 1889. He was of Dutch descent, was graduated from Amherst in 1837, studied theology at Andover, and in 1839-69 was a missionary in Turkey. He was conversant with most of the Oriental languages, and during the greater share of his residence in Turkey he was connected with educational institutions at Constantinople, Smyrna, and Tocat. The loss of his sight compelled him in 1869 to return to the United States, where he engaged in literary work, and in teaching. He occupied the chair of natural science, Greek and modern languages at Ingham University, Le Roy, N. Y., in 1876-8 and from then until his death was principal of Sedgwick Institute, Great Barrington, Mass. He published: 'Travels in Asia Minor' (1870); 'Ten Days Among the Greek Brigands' (1874); 'Bible Lands' (1876); etc.

Vanloo, vān-lō, Jacob, Dutch painter: b. Sluis about 1614; d. Paris 26 Nov. 1670. He was made a member of the French Academy and

was famous in his time as a painter of portraits in the style of Der Helst and Rembrandt; scenes from fashionable life; and mythological pictures such as 'Diana and her Nymphs' in the galleries of Berlin and Brunswick, and 'Cenone' in that of Dresden.

Vanloo, Jean Baptiste, Dutch painter: b. Aix 11 Jan. 1684; d. there 19 Sept. 1745. In 1731 he was elected to the Academy; produced many portraits, including that of Louis XV.; and mythological pictures, such as 'Diana and Endymion' (in the Louvre); 'The Triumph of Galatea' (in the Hermitage at Saint Petersburg). His son, LOUIS MICHEL VANLOO (b. Toulon 1707; d. Paris 20 March 1771), studied in Rome and Paris, in which latter city he became member of the Academy. Settling at Madrid he was appointed court painter to Philip V. and there are three portraits of the Spanish royal family by him in the Prado Gallery and an allegorical picture.

Vanloo, Louis, Dutch painter, son of Jacob Vanloo (q.v.); b. Amsterdam about 1640; d. Aix 1712. At Paris he carried off the first prize of the Academy. His more illustrious son, CHARLES ANDRÉ, was both painter and sculptor, and studied at Rome under Le Gros. In 1719 he went to Paris and assisted his brother Jean Baptiste Vanloo in restoring the frescoes at Fontainebleau. He was received into the French Academy in 1735, made professor there two years later, in 1763 director of the Academy and first painter to the King. In the Louvre are his 'Æneas Carrying Anchises from Troy' (1729); 'Marriage of the Virgin' (1730); 'Apollo and Marsyas' and a portrait of 'Queen Maria Leczinska' (1747).

Vann, vān, Irving Goodwin, American jurist: b. Ulysses, N. Y., 3 Jan. 1842. He was graduated at Yale in 1863, and at the Albany Law School in 1865, and in the following year began to practise in Syracuse. In 1879 he served as mayor of that city. From 1882 to 1896 he was a justice of the New York Supreme Court, and in 1896 was appointed by the governor a judge of the Court of Appeals, to which position he was elected in 1897 for the term of 14 years. He was one of the founders of the Onondaga County Bar Association, and has been president of the New York State Bar Association. He has been lecturer in the Albany, Cornell, and Syracuse law schools.

Vannes, vān, France, a seaport town, capital of the department of Morbihan, on the Vannes, where it falls into a narrow inlet of the Gulf of Morbihan, 64 miles northwest of Nantes. It is walled, and has narrow gloomy streets overhung by antiquated timber houses. The principal buildings are the cathedral, the modern town hall, and Jules Simon College. The town possesses a museum, rich in Celtic antiquities. The manufactures consist of coarse cotton goods, lace, leather, and ropes. The trade is in corn, hemp, honey, wax, butter, salt, tallow, cider, and wine. Pop. (1901) 23,375.

Van Nop'pen, Leonard Charles, American lecturer: b. in Holland 8 Jan. 1868. He came to the United States with his parents when a child. He was graduated from Guilford College, N. C., in 1890, and in 1894 was admitted to the North Carolina bar. He studied Dutch literature abroad and has lectured on that sub-

VAN OSTADE—VAN SHAACK

ject at Columbia, Princeton, the Lowell Institute at Boston, etc. He has translated Vondel's 'Lucifer' (1898), the first English metrical translation and Vondel's 'Samson' and Vondel's 'Adam' (1903); etc.

Van Ostade, vān ős'tā-dě, **Adrian**. See **OSTADE, ADRIAN VAN**.

Van Pelt, John Vredenburg, American architect: b. New Orleans 24 Feb. 1874. He studied architecture at the Ecole des Beaux Arts, Paris, exhibited in the Paris Salon, section of architecture, 1895-6, and in the section of painting in 1898. He was assistant professor of architecture in charge of design at Cornell 1897-1900 and is now (1904) professor in charge of the College of Architecture there. He has written 'Discussion of Composition as Applied to Art' (1902).

Van Rensselaer, vān rěn'sě-lěr, **Kilaen** or **Killian**, Dutch colonizer in the New World: b. Amsterdam 1595; d. there 1644. He was a diamond and pearl merchant at Amsterdam; was a founder of the Dutch West India Company, to which on two occasions he advanced sums for the maintenance of its credit; and sent a representative to New Netherlands to negotiate with the Indians for the purchase of territory on the west bank of the Hudson, extending from Smack's Island to a point 12 miles south of Albany (Beeren, or Bear's Island), and into the interior two days' journey. This purchase was later increased by that of territory on both sides of the river northward and southward from Fort Orange. This tract (Rensselaerswyck) comprised in all a large part of the counties of Rensselaer, Columbia, and Albany. Van Rensselaer did not visit it, but managed all its affairs through an agent. He sent Adriaen van der Donck as sheriff of the colony established there, and Dominie Megapolensis for the "edifying improvement" of Dutch and savages.

Van Rensselaer, Mariana Griswold, American author: b. New York. She is known through her writings as a student and critic of art, and has also participated in discussions bearing upon politics, etc. She is president of the New York Public Education Association. Her publications include: 'Henry Hobson Richardson and His Works' (1888); 'English Cathedrals' (1893); 'Six Portraits'; 'Art Out of Doors' (1893); 'Should We Ask for the Suffrage?' (1894)—against woman suffrage; and 'One Man Who Was Content' (1896). She was married to Schuyler Van Rensselaer in 1873.

Van Rensselaer, May King, American writer: b. New York 25 May 1848. She was educated privately and was married to John King van Rensselaer 4 Oct. 1871. She has published: 'Crochet Lace' (1882); 'The Devil's Picture Books' (1887); 'The Goede Vrouw of Mana-ha-ta' (1889); 'Van Rensselaers of the Manor' (1889); 'New Yorkers of the 19th Century' (1899); etc.

Van Rensselaer, Stephen, American politician and soldier, known as "The Patroon": b. New York 1 Nov. 1764; d. Albany 26 Jan. 1839. He was the fifth in lineal descent from Killian Van Rensselaer (q.v.), the original patroon of the Dutch colony of Rensselaerswyck. He entered Princeton College in 1771, but owing to the proximity of the British army was removed to Harvard, where he was graduated in 1782. In

1789 he was elected to the Assembly, and the next year to the State senate, to which he was re-elected annually till 1795, when he was chosen lieutenant-governor and served till 1801. He presided over the State Constitutional Convention of 1801, and in 1808-10 was again in the Assembly. He was made major-general of the State militia, and in 1812 directed the assault upon Queenstown, Canada. After the war he joined with DeWitt Clinton (q.v.) in the construction of the Erie Canal, for exploring the proposed route of which he had been one of a commission in 1810-11, and from 1816 till his death was one of the board of canal commissioners, and for 15 years was its president. He was again a member of the legislature in 1816, in 1819 was elected a regent of the University of the State of New York, and was subsequently its chancellor. In 1821-3, at his own expense, he employed Professors Eaton and Hitchcock to make geological and agricultural surveys of a large part of the State. In November 1824 he provided suitable buildings at Troy, and established a scientific school for the instruction of teachers. This school was incorporated in 1826 as the Rensselaer Polytechnic Institute, and he continued to aid in supporting it until the end of his life. From 1823 to 1829 he was a member of Congress. He published 'A Geological and Agricultural Survey of the District Adjoining the Erie Canal' (1824). Consult Barnard, 'A Discourse of the Life, Services, and Character of Stephen Van Rensselaer' (1839).

Van Reyepen, vān rī'pēn, **William Knickerbocker**, American naval officer: b. Bergen, N. J., 14 Nov. 1840. He was graduated from the medical department of the New York University 1862, and the same year served at the Naval Hospital in New York. He represented the medical department of the United States navy at the international medical congress at Moscow 1897, and during the war with Spain designed and fitted out the first ambulance ship ever used in naval warfare. He was retired in 1902 after 40 years' service with the rank of senior rear admiral.

Van Sant, Samuel R., American statesman and soldier: b. Rock Island, Ill., 11 May 1844. At the outbreak of the Civil War he enlisted in the Union Army and served for three years. He was elected to the legislature 1892 and 1894 and was speaker of the same body 1895. In 1901 he was elected governor of Minnesota.

Van Sant'voord, George, American lawyer and author: b. Belleville, N. J., 8 Dec. 1819; d. 6 March 1863. He was graduated at Union College in 1841, studied law at Kinderhook, N. Y., was admitted to the bar in 1844, and practised at Kinderhook from 1846 to 1851, when he removed to Troy, N. Y. In 1852 and in 1856 he was a member of the Assembly, and in 1860-3 was district attorney of Rensselaer County. His writings include: 'Life of Algernon Sydney' (1851); 'Principles of Pleading in Civil Actions Under the New York Code of Procedure' (1852); 'Lives of the Chief Justices of the Supreme Court of the United States' (1854); and 'A Treatise on Practice in the Supreme Court of the State of New York in Equity Actions' (1860).

Van Shaack, vān shāk, **Peter**, American lawyer: b. Kinderhook, N. Y., March 1747; d.

VANSITTART — VAN WYCK

there, 27 Sept. 1832. He was graduated from King's (now Columbia) College in 1766, was admitted to the bar in 1769, and established a law practice in New York. In 1773 he was appointed to revise the statutes of the colony of New York, and he later served on various committees for the consideration of the measures of the British government which resulted in the Revolution. Although greatly incensed at the action of the government he was nevertheless opposed on general principles to the Revolution and in 1777 was summoned before the board of conspiracies to take the oath of allegiance to New York. On refusing he was sent to Boston. In 1778 he was banished, and went to England where he remained until 1785. He was then restored to citizenship in New York and readmitted to the bar. He gained a high reputation in his profession and also as an instructor in his law school. He was totally blind during the last years of his life. Among his publications are: 'Laws of the Colony of New York' (2 vols., 1773); 'Conductor Generalis, or the Duty and Authority of Justices, Sheriffs, Coroners, etc.' (1788). Consult H. C. Van Shaack, 'Life, Journal and Letters of Peter Van Shaack' (1842).

Vansittart, vān-sit'art, Nicholas, BARON BEXLEY, English statesman: b. London 29 April 1766; d. Kent, England, 8 Feb. 1861. He was graduated from Christ Church, Oxford, in 1791, called to the bar in that year and in 1796-1802 sat in Parliament for Hastings. He held various offices in the political ministry until 1812 when he became chancellor of the exchequer, and upon his retirement in 1823 he was created Baron Bexley. He was then chancellor of the duchy of Lancaster until 1828, when he retired on a pension.

Van Twiller, Wouter or Walter, Dutch governor of New Netherland: b. Nieuwkerk about 1580; d. Amsterdam after 1646. He was a clerk in the warehouse of the West India Company at Amsterdam when he was chosen to succeed Peter Minuit as director-general of New Netherland. He arrived at the colony in the Southberg in April 1633, bringing with him the Spanish caravel *San Martin*, captured on the voyage. In the Southberg came also Dominie Everardus Bogardus and Adam Roclandsen, the first clergyman and first schoolmaster in the province. Van Twiller was incompetent for his new post, and in his administration there was considerable to warrant the well-known burlesque of Irving in 'Knickerbocker.' But he devoted much attention to internal improvements, repaired Fort Amsterdam, built new windmills and other structures, secured large grants from the Indians, extended the trade with the West Indies and New England, and displayed many other excellent activities. He was also alert in defense of the fur trade, by which the colony was realizing large profits. In 1633 Eelkens, who had been commissary at Fort Orange, sailed up the Hudson to within a mile of the Fort in an English vessel, the *William*, bent on a trading enterprise for English capitalists. Van Twiller soon convoyed the *William* out to sea, with the Dutch fleet, and prevented the establishment of English trade upon the river. When Winthrop wrote asserting the superior title of the English to the Connecticut Valley, Van Twiller, in a "very courteous and respectful" letter, suggested that the matter should be adjusted by the English

king and the States-General. However, without Winthrop's assent, New Plymouth sent to Connecticut an expedition commanded by Lieutenant William Holmes which passed up the river by the Dutch Fort of Good Hope, and began at Windsor the first English settlement in Connecticut. Lubbertus van Dincklagen, the schout-fiscal, who had been removed and sent to Holland without arrears of pay, preferred charges against his chief; and David Pietersen de Vries, of Hoorn, declared that Van Twiller was "acting farces" in the province. Van Twiller was removed in 1637 and succeeded by William Kieft. He held a large estate in the colony, and was an opponent of Stuyvesant in 1650.

Van Tyne, Claude Halstead, American author: b. Tecumseh, Mich., 16 Oct. 1869. He was graduated from the University of Michigan in 1896, was instructor in history at the University of Pennsylvania 1900-3, and is now (1904) assistant professor of American history at the University of Michigan. He has written 'Brief History of the United States of America' (1900); 'The Loyalists in the American Revolution' (1902); and edited 'The Letters of Daniel Webster' (1902).

Vanuxem, Lardner, American geologist and chemist: b. Philadelphia, Pa., 23 July 1792; d. Bristol, Pa., 25 Jan. 1848. He was graduated from the Ecole des Mines at Paris in 1819, and in 1820-6 occupied the chair of chemistry and mineralogy at the South Carolina College. He resigned in the latter year in order to adopt geology as a profession and in 1827-8 he was engaged under the New York legislature in studying the geological aspects of New York, Ohio, Kentucky, Tennessee, and Virginia. He was state geologist for New York in 1836-42, was a promoter of the Association of American Geologists organized in 1840, and in addition to numerous scientific papers, he published: 'An Essay on the Ultimate Principles of Chemistry, Natural Philosophy, and Physiology' (1827); and 'Geology of New York, 3d District' (1842).

Vanvitelli, Luigi, loo-ē'jē vān-vē-tē'l'ē, Italian architect: b. 1700; d. 1773. He was appointed architect to Saint Peter's at Rome in 1726; and he erected, while in the prime of his powers (1752), for Charles III. of Naples, the magnificent palace at Caserta with its gardens and cataract. As an example of late Renaissance architecture in Italy this palace is scarcely paralleled by any building in Europe.

Van Wert, vān wért, Ohio, city, county-seat of Van Wert County; on the Pennsylvania and the Cincinnati, Jackson & Mackinaw R.R.'s; about 100 miles, in direct line, northwest of Columbus and 75 miles southwest of Toledo. It is in an agricultural and stock-raising region. In 1900 (government census) there were 81 manufacturing establishments, with an invested capital of \$434,678, and annual products valued at \$627,672. The two banks have a combined capital of \$160,000 and deposits amounting to \$1,093,990. Pop. (1890) 5,512; (1900) 6,422.

Van Wyck, Charles Henry, American legislator: b. Poughkeepsie, N. Y., 10 May 1824; d. Washington, D. C., 24 Oct. 1895. He was graduated from Rutgers in 1843, engaged in law practice, in 1850-6 was district attorney of Sullivan County, N. Y., and in 1859-63 was a member of Congress. While still holding his seat in

Congress he volunteered in the Union army, served under General McClellan in the Peninsular campaign, and in 1865 was brevetted brigadier-general of volunteers. He sat again in Congress in 1867-71, and in 1874 removed to Nebraska, where he was a member of the State constitutional convention in 1876, State senator in 1876-80 and in 1881 became United States senator.

Van Zile, Edward Sims, American novelist: b. Troy, N. Y., 2 May 1863. He was graduated from Trinity College, Hartford, 1884, and from 1884-6 was editorial writer on the *Troy Times* and on the *New York World* from 1886-90. He was for a time manager of the Literary Bureau of the United Press and editor of 'Current Literature,' and he has published 'Wanted—A Sensation' (1886); 'The Last of the Van Slacks' (1889); 'A Magnetic Man' (1890); 'The Manhattaners' (1895); 'Kings in Adversity' (1897); 'With Sword and Crucifix' (1899); 'Defending the Bank' (1903).

Vapereau, vâp-ê-rô, Louis Gustave, French scholar and compiler: b. Orleans 4 April 1819. He was educated at the Ecole Normale, Paris; was professor of philosophy at the College of Tours, 1843-52; admitted to the bar in 1854; and about the same time made editor of the famous 'Universal Dictionary of Contemporaries' (1858; 6th ed. 1891-3). Among his other important works are: 'Literary and Dramatic Year' (1859-69); 'Universal Dictionary of Literatures' (1876); and 'Historical Elements of French Literature' (1883-5). In 1870-1, during the German invasion, he was prefect of Cantal, and afterward prefect of Tarn-et-Garonne. He was inspector-general of primary schools from 1877 to 1888, and received the Cross of the Legion of Honor in 1878.

Vapor, in physics, a term used to designate the gaseous form which a solid or liquid substance assumes when heated. Vapor is, therefore, essentially a gas, and seeing that all known gases have now been proved to be liquefiable, no physical difference can be said really to exist between an ordinary gas, such as oxygen, and a vapor, such as steam. In common language, however, a difference is usually recognized; a gas is a substance which at ordinary temperatures and pressures exists in a state of vapor; while a vapor is produced by the application of heat to a substance which normally exists in a solid or liquid form. The difference has been otherwise explained to be one not so much of kind as of degree; steam in the boiler of a steam-engine being said to be in a state of vapor, while superheated steam is said to be a gas. Aqueous vapor formed on the surface of the land and water is always present in suspension in the atmosphere, and when it meets with a reduction of temperature it condenses into water in the form of rain or dew. See GAS.

Vapor Mercury Lamp, The Hewitt, a novel form of electric lighting invented in 1902 by Peter Cooper Hewitt of New York. All other forms of artificial light now in practical use depend for their lighting properties upon the incandescence of a solid—usually carbon—either in the form of a filament or a rod, as in the ordinary glow lamp or the arc, or in a finely divided state, as in gas and kerosene

lamps. The mercury vapor lamp, as its name implies, derives its light from the gas or vapor of mercury, in which the passage of an electric current causes a high state of incandescence. The lamp is constructed of a glass tube having a metal sealing-in wire at each end. These wires lead the current to the electrodes, one or both of which are of mercury. The tubes are exhausted to a high degree on a vacuum pump and sealed off. This prevents any escape of the vapor which fills the tube. One 330-watt Hewitt lamp will replace nine 32-candle-power incandescent lamps and give much more than twice the amount of light, using only one third the current. Or the same lamp will replace 12 16-candle-power incandescent lamps, giving over three times the light for one half the current. The light may be employed to great advantage for purposes where considerable illumination is required, and where the ordinary arc light is unsatisfactory on account of its sharp and heavy shadows and its flicker. Another great field of application of the lamp is for all sorts of photographic processes. The illumination being so diffused, and the light composed to a great extent of the so-called "actinic" or chemically active rays, it furnishes for this work, where there has never been a satisfactory artificial illuminant, a perfect substitute for daylight. See also ELECTRIC LIGHTING.

Varangians, vâ-rân'ji-anz, or Vara'gians, a word meaning "sworn men," that is, men bound by oath to stand by each other in their undertakings, and derived from the Scandinavian *varar*, an oath. The term is best known as applied to Northmen who entered the service of the Byzantine emperors, and were imperial guards at Constantinople, noted for their courage and fidelity, but also taking decisive part, at times, like the Prætorian guards at Rome, in making and unmaking emperors. The Varangians were not always Northmen in the restricted sense of that term, but included Saxons and other Germans. The designation is also applied to the adventurers from Scandinavia who founded principalities in Russia, which were the beginning of the present Russian empire, and powerful enough for a time to threaten the overthrow of the Byzantine dominion.

Varan'idæ, Varanus, the family and type genus of the lizards called monitors. See LIZARD; MONITOR.

Var'ec, the name in Brittany for the crude ash produced by burning seaweed. See KELP.

Vargas, Luis de, loo'ês dâ vâr'gäs, Spanish painter: b. Seville 1502; d. there 1568. He began, after the manner of Spanish painters of the period, by applying water colors to a coarse-textured cloth called "sarga," (serge or bunting) and the pictures thus executed were washed over with thin gum or paste. Curtains for churches and naval ensigns were manufactured in this style, and the painting of sargas was practised by Sevillian artists, including Murillo long after the time of Vargas. But this great painter by breaking away from the traditional Spanish method is notable as having introduced into Seville the best Italian methods of fresco and oil. This he did after visiting Rome 1527; and attaching himself to Pierino del Vaga (q.v.). After the sack of the city in that year he fled with his master to Genoa. He did not leave

VARIABLE QUANTITIES — VARICOSE VEINS

Italy for his native country until 1555. As a painter he was highly imaginative, and evinces a taste for grandeur and simplicity. His heads are beautiful and full of devotional refinement. In the Chapel of the Nativity in Seville Cathedral he painted his 'Navidad' in 1555, but his masterpiece is 'The Temporal Generation of our Lord' which represents the human ancestors of Christ adoring the Madonna and Child.

Variable Quantities, in mathematics, are algebraic symbols placed in relationship one to another, so that if different numerical values are given to a particular letter the other letters will have corresponding values or sets of values: for instance, let $y = x^2 + 3$; when $y = 12$, $x = 3$; when $y = 19$, $x = 4$, and so on; y is called the independent variable and x the dependent variable, because the value of x depends on the value we assume for y . See ALGEBRA.

Variation, in the philosophy of biology, the departure in any direction from the mean character of the species. When the variation in a large number of individuals, generally more or less isolated in space, is of a marked and constant type, the group of individuals which exhibit such variation is termed a variety.

The fact of variation is essential to theories of organic evolution. Whether it is determinate or indeterminate is much discussed; that is, whether organisms have or have not a tendency to vary in particular ways. It is the view of the extreme Darwinists that there is primitively no tendency to any special mode of variation, any existing tendency being the result of the selection of those individuals which chanced to vary along these particular lines. According to other biological observers and thinkers there is, apart from the guidance of natural selection, an inherent bias, differing in different groups of organisms toward variation in determinate lines. This may be due to the inheritance of characters individually acquired under the stress of surrounding conditions (direct environmental determinism); or to constitutional tendencies inherent in the individuals of each species, and analogous to the inherent tendencies of inorganic substances, to assume definite crystalline forms (innate specific determinism).

It has been claimed by certain American biologists that paleontological evidence establishes the existence of determinate variation. The teeth and the limb-bones of more than one series of fossil ungulates are found to exhibit variation along definite and determinate lines. The facts may be admitted; but the reasoning based thereon is inconclusive. The variation adduced is confessedly along lines that are advantageous to the individuals in which it occurs. It would, therefore, on the Darwinian theory, escape that elimination which would be the fate of non-advantageous and neutral variations. If the teeth of mammals varied indeterminately, and if all variations save those along one line (or several correlated lines) were neutral or non-adaptive, these latter would be eliminated through inter-crossing, while the adaptive variation would become evident. In the fossil forms the variations along non-adaptive lines would be so slight as to escape detection, while those in a plus or minus direction along adaptive lines would be assigned to different stages in the evolution of the variation in question.

A. R. Wallace and others have tabulated some results of the observation of variation in the state of nature; and Wallace has shown that variations in size or length of particular parts are considerable, "usually reaching 10 or 20, and sometimes even 25 per cent of the varying part," and occurring in 5 to 10 per cent of the specimens examined. These results incidentally show that in the species under examination there was no very rigid elimination, and that inter-crossing did not suppress variations from the mean to such an extent as is sometimes supposed.

On the hypothesis of indeterminate variation it must be confessed that we are to-day not much in advance of Charles Darwin, who said: "Our ignorance of the laws of variation is profound. Not in one case out of a hundred can we pretend to assign any reason why this or that part has varied."

Consult the works of Charles Darwin, Lamarck, Weismann, and Wallace (qq.v.); also Bateson, 'Materials for the Study of Variation' (London 1894); Romanes, 'Darwin and After Darwin' (Chicago 1893-6); De Varigny, 'Experimental Evolution' (London 1892); Cope, 'Primary Factors of Organic Evolution' (Chicago 1896), and other works; De Vries, 'Die Mutations Theorie' (Leipsic 1901); Poulton, 'Darwin and the Theory of Natural Selection' (London 1896).

See DARWINIAN THEORY; EVOLUTION; LAMARCKISM.

Variation, Calculus of, a subdivision of the differential calculus (see CALCULUS) by which the laws associating the variable quantities are themselves subject to change.

Varicose Veins, a diseased condition of the veins in which they become dilated, and assume a tortuous course, presenting to the touch a soft elastic sensation, except in the situation of their valves, where they form hard knotty swellings, generally of a dark bluish color. This disease occurs most frequently in the lower limbs, and is indeed a very common affection there; but it also occurs in the veins of the scrotum, and in those at the lower part of the rectum, forming in the latter case the tumors called bleeding piles. In the lower limbs varix is often complicated with peculiar indolent ulcers, and sometimes the varix bursts and hemorrhage takes place, which, if not speedily stopped may lead to death. Varicose veins are caused by the presence of some obstruction to the free return of the venous blood toward the heart, and such obstruction may arise from tumors within the abdomen, enlargement of the liver causing pressure on the ascending vena cava, pregnancy, constipation of the bowels, tight gartering, and other causes. As to the treatment, the first step of course is to remove the cause of the disease, whenever that is possible. If the disease is grappled with at an early stage much good may be effected by enjoining complete rest in a horizontal posture, by bathing the limb with cold water twice or thrice a day, and by the use of a properly applied bandage or laced stocking. When the disease is far advanced no radical cure can be effected except by a surgical operation, and the patient will generally do better to rest content with a palliative treatment.

Varilla, vā-rē-lā, **Philippe Bunau**, French engineer and diplomat. He was graduated from the Ecole Polytechnique, entered the civil division of French engineers, planned and directed the construction of harbor-works and railways in Algeria and Tunis, and in 1884 became connected with the De Lesseps Panama canal enterprise, work on which had then been proceeding about two years. At his suggestion, many radical changes were made in the original plans. In regard to the question of an isthmian canal, he published in 1892 'Panama: Le Passé, le Present, l'Avenir.' His active work in connection with the Panama canal company ended in 1888. He spoke several times in the United States in advocacy of the Panama route, and after the revolution (see PANAMA) was chosen as representative of the new republic of Panama at Washington. In the spring of 1904 he returned to France. Among his other works as an engineer were the Kongo railway, West Africa, and the improvements of navigable waterways in Rumania.

Varinas, vā-rē'nās, or **Barinas**, Venezuela, a town in the State of Zamora, on the right bank of the Saint Domingo, 80 miles southeast of Merida. It is a neat place, at the opening of a valley; and has a church and a hospital. Cacao, coffee, and tobacco are cultivated in the neighborhood, but the town and its industries have much declined in recent years. Pop. about 2,000, formerly 12,000.

Vari'ola, smallpox (q.v.).

Variscite, vār'ī-sīt, a native hydrous phosphate of aluminum. It has a brilliant vitreous lustre, and usually a rich grass green color, more rarely bluish or white. A massive variety found in Utah is called Utahite (q.v.). Individual crystals have orthorhombic symmetry; they are rarely well developed, being usually clustered into little sheaf-like aggregates, which densely coat the surfaces of the matrix. Its hardness is 4 and specific gravity about 2.4. Its best known American localities are in Arkansas and Utah.

Varna, vār'nā, Bulgaria, a fortified seaport town on the west shore of the Black Sea, at the mouth of a river of the same name, 160 miles northwest of Constantinople. It exports wheat, maize, cattle, attar of roses, etc., and imports woollens, metals, sugar, coffee, leather, haberdashery, machinery, etc. The harbor has been modernized, and Varna is now an eastern terminus of the Bulgarian railway system. It is the see of a Greek and a Bulgarian archbishop. In 1444 Ladislaus, king of Hungary, was defeated and slain by Amurath II., sultan of the Turks, near this town. In 1828 it was taken possession of by the Russians, but was restored to the Turks in the following year by the Peace of Adrianople. In 1854 the Crimean expedition sailed from it. Pop. (1900) 33,443.

Varnhagen, vār'n-ā'gĕn, **Francisco Adolphe de**, Brazilian historian: b. São João de Ypanema, Brazil, 17 Feb. 1816; d. Vienna, Austria, 29 June 1878. He was taken to Portugal when very young, educated in the royal military college, and in 1833-4 served in the constitutional army against Dom Miguel. He afterward engaged in historical researches, returned to Brazil in 1841, and during the remainder of his life was largely occupied on various diplo-

matic missions in South America and in Europe. As a historian he ranks easily at the head of Brazilian men of letters, his work displaying profound research and presented with clearness and force. He edited and published various historical documents, contributed numerous papers to the 'Revista do Instituto do Brazil' and other periodicals, and wrote: 'Noticias do Brazil' (1852); 'Historia geral do Brazil' (1854-7); 'Das wahre Guanahani des Columbus' (1869); 'L'origine Touraniennne des Américains Tupis-Caribes, et des anciens Egyptiens' (1876); etc.

Varnhagen von Ense, vār'n-hā-gĕn fōn ĕn'sĕ, **Karl August**, German soldier, diplomat, and author: b. Düsseldorf 21 Feb. 1785; d. Berlin 10 Oct. 1858. He studied at Berlin, Halle, and Tübingen, assisted Chamisso in the latter's 'Musenalmanach' (1804), in 1809 entered the Austrian army, fought at Aspern and Wagram, and after the peace was made adjutant to Prince Bentheim. Then he entered the Russian service as captain, served in Tettenborn's corps, and wrote a 'Geschichte der Kriegszüge Tettenborns' (1814). He accompanied Prince Hardenberg to the Congress of Vienna (1814), and in 1815-19 was Prussian minister-resident at Carlsruhe. Subsequently he lived chiefly at Berlin, where he was the autocrat of a literary circle. He was particularly successful in biographical portraiture, though at times relying over-much on the anecdotal method. Among his published works are: 'Goethe in den Zeugnissen der Mitlebenden' (1823); 'Biographische Denkmäler' (1824-30); 'Denkwürdigkeiten und Vermischte Schriften' (1843-6; two additional vols. 1859); 'Tagebücher' (1861-72); 'Ausgewählte Schriften' (1871-7).

Varnish, a solution of resinous matter, forming a clear, limpid fluid, capable of hardening without losing its transparency, and used by painters, gilders, cabinet-makers, etc., for coating over the surface of their work in order to give it a shining, transparent, and hard surface, capable of resisting in a greater or less degree the influences of air and moisture. The resinous substances most commonly employed for varnishes are mastic, sandarac, lac, benzoin, copal, amber, and asphalt; and the solvents are fixed oil, volatile oil, and alcohol. Fixed oil varnishes are the most durable, and are the best adapted for all objects that are exposed to the weather. Amber varnish is a varnish of this kind. It is composed of amber, linseed-oil, litharge, and turpentine. Volatile oil varnishes consist of a solution of resin in oil of turpentine. The varnish being applied the oil flies off and leaves the resin. They are used chiefly for paintings. When resins are dissolved in alcohol the varnish dries very speedily, and is liable to crack; but this fault is corrected by adding a small quantity of turpentine to the mixture, which renders it brighter as well as less brittle. See PAINT, OIL, AND VARNISH INDUSTRY.

Varnish Trade, **The**. See PAINT, OIL AND VARNISH INDUSTRY.

Varnish-tree, a name given to various trees, yielding a sap or secretion that serves for varnish and lacquer. *Rhus vernicifera* furnishes the famous Japanese lacquer (q.v.) and is one of the most important varnish trees. Another very important tree is the Martaban Bur-

mese or black varnish-tree (*Melanorrhæa usitata*), a tree some 60 feet high, called theetsee by the Burmese. When cut it exudes a thick, viscid, grayish juice, blistering in its effects, drying slowly, and turning black on exposure. This black varnish is used extensively in Burma for lacquering various vessels, furniture, temples, etc. The fruits of several species of *Semecarpus*, and especially the marking nut, produce a black varnish in India. *Aleurites cordata* is the Chinese, and *Elæagia utilis* the rubiaceous New Granada, varnish-tree; the latter secreting in its stipular axils, a resinous substance, used by the Colombians as a lacquer. A valuable resin exudes from the trunk of the West Indian varnish or locust-tree (*Hymenæa Courbaril*), a leguminous tree growing to an enormous size and living for centuries. The false varnish-tree is the *Ailanthus glandulosa*, or tree of heaven, from China. The Mareton Bay varnish-tree is a tall, evergreen of sub-tropical Australia (*Pentaceras*).

Var'num, James Mitchell, American general: b. Dracut, Mass., 1749; d. Marietta, Ohio, 10 Jan. 1789. He was graduated from Rhode Island College (now Brown University), studied law, and established himself in practice at East Greenwich, R. I. When the Revolution broke out, he was appointed colonel of a regiment to be raised to the counties of Kent and Kings, and afterward received a commission from Congress when Washington was appointed commander-in-chief. In February 1777, he became brigadier-general; and he commanded all the troops on the Jersey side of the Delaware, when the British and Hessians took possession of Philadelphia. In 1779 he resigned his commission, was delegate from Rhode Island to the Continental Congress 1780-2, and again in 1786-7. In 1787 he was appointed one of the judges of the Northwest Territory, and removed to Marietta, the first city established west of the Ohio.

Varotari, vā-rō-tā-rē, Alessandro (known also as 'IL PADOVANINO'), Italian painter: b. Padua 1590; d. Venice 1650. He was the son of Dario Varotari, a Veronese painter, who taught his son the first principles of his art. Alessandro subsequently went to Venice and there devoted himself with enthusiasm to the study of Titian and Paolo Veronese. The pictures he painted at Venice under the inspiration of these masters were most of them destined to adorn the churches of Padua. There are two examples of this painter in the London National Gallery; but his style and admirable coloring are best represented by his 'Marriage of Cana in Galilee' (1622) now in the Academy at Venice; and his 'Judith with the Head of Holofernes' (his grandest production), in the Dresden Gallery, a replica of which may be seen in the Imperial Gallery at Vienna.

Varro, Marcus Terentius Reatinus, Roman scholar and author: b. Reate 116 B.C.; d. 27 B.C. He received a liberal education, held a high office in the navy in the wars against the pirates and against Mithridates, and at the commencement of the civil war was serving in Spain as legate of Pompey. When Cæsar marched into that country after the reduction of Italy, Varro was obliged to surrender his forces; but still adhering to the aristocratic party, joined Pompey in Greece. His villa at Casinum was

plundered by Antony, but Cæsar employed him to superintend the collection and arrangement of the works in the library at Rome designed for the public use. From this time Varro lived in retirement, chiefly at his residences near Cumæ and Tusculum. During the second triumvirate he was put by Antony on the list of proscribed, but by the aid of friends his life was saved, though his libraries were destroyed. He gained the favor of Augustus, who appointed him superintendent of the library founded by Asinius Pollio. Varro was called by Quintilian "the most learned of the Romans," and according to his own statement he had written 490 books by 39 B.C. A list by Saint Jerome gives 74 works, containing 620 books. He wrote historical, antiquarian, biographical, critical, philosophical, and geographical treatises, besides others of a miscellaneous character. Some of his works perished with his library, and only one has come down to our time entire, the treatise 'De Re Rustica,' written when he was 80, and the best work on ancient agriculture extant. The best edition is that in the 'Scriptores Rei Rusticæ Veteres Latini,' of J. G. Schneider (1794-7, English translation by Owen 1803). Of a grammatical treatise entitled 'De Lingua Latina,' six books (V.-X.) out of the original 24 are extant, though mutilated; the best edition is that of Müller (last ed. 1883). Consult Boissier, 'Etudes sur M. T. Varro' (1861).

Varro, Publius Terentius, Roman poet: b. Atax, Narbonensian Gaul, about 82 B.C.; d. about 37 B.C. He is sometimes distinguished from the preceding by his surname, Atacinus. He was the author of an epic on Cæsar's Gallic campaigns, 'Bellum Sequanicum'; 'Argonautica,' an epic which survives in fragments only; and satires and sonnets.

Varus, vā'rūs, Publius Quintilius, Roman general. He was consul in 13 B.C., afterward proconsul of Syria, where he gained the confidence of Augustus by checking an insurrection of the Jews. Six years later he received from the emperor, with whose family he was connected through his wife, the command to introduce the Roman jurisdiction, language, and religion into that part of Germany which had just been conquered by Drusus. A general revolt having been secretly arranged by Arminius, Varus was attacked by an immense host, and while trying to make his escape had his whole army, consisting of three legions, cut to pieces in a pass of the Saltus Teutoburgensis. Varus put an end to his own life. The exact scene of this battle is disputed. (See ARMINIUS.) In consequence of this defeat the Roman dominion was once more limited, roughly speaking, by the Rhine on the east and the Danube on the north.

Vasa, vā'sā, House of, a Swedish royal family founded by Gustavus Vasa (Gustavus I., q.v.), who was elected king in 1523. The family held direct possession of the throne until 1654, Gustavus II. (Gustavus Adolphus, q.v.) being its most illustrious representative. He was succeeded by his daughter Christina (q.v.), who never married. She assumed the government in 1644, and in 1654 resigned it in favor of her cousin Charles Gustavus (Charles X., q.v.), by whom a collateral female branch was intro-

VASARHELY — VASES

duced. Christina survived until 1689. The House of Vasa gave to Poland three kings, of whom the first began to reign in 1587, and the last, John Casimir, abdicated in 1668. With his death in 1672 this branch of the family became extinct.

Vasarhely, vā'shār-hēly, or **Hodmező-Vasarhely**, hōd'mě zē vā'shār-hēly, a large market-town in the comitat of Csongrad, on Lake Hed and the Karoly Canal, leading into the Theiss, 12 miles northeast of Szegedin. Tobacco and wine are grown; a great many cattle are reared in the neighborhood, and large cattle markets are held in the town. The inhabitants mostly belong to the Reformed Church. Pop. (1900) 60,883.

Vasarhely, or **Maros-Vasarhely**, mār'ōsh vā'shār-hēly, Hungary, the capital of Maros-Torda County, and a royal free city, in Transylvania, on the Maros, 50 miles by rail southeast of Klausenburg. Its ancient castle is now used as the garrison barracks, and contains a 15th century Gothic church. In the former palace is a large library which possesses a manuscript of Tacitus. The town has a trade in lumber and petroleum, and sugar, beer, spirits, and tobacco are manufactured. Pop. (1900) 19,091.

Vasari, Giorgio, jōr'jō vā-sā'rē, Italian painter, architect, and art writer: b. Arezzo, Tuscany, 30 July 1511; d. Florence 27 June 1574. He studied under Luca Signorelli, Michelangelo, and Andrea del Sarto. The Cardinal Ippolito de Medici, Pope Clement VII., and the Dukes Alessandro and Cosmo of Florence, successively engaged him in their service. As an architect he showed great ability, and two of his designs, that of the Palazzo degli Uffizi at Florence, and that of the church of Abbadia at Arezzo, are among the best of his time. As a painter he was less successful. His principal paintings are a 'Lord's Supper,' in the cathedral of Arezzo, and several works in the Palazzo Vecchio in Florence, and in the Vatican in Rome. He has himself given us an account of his different works in Florence, Arezzo, Pisa, Venice, Bologna, Rome, etc. They exhibit all the faults of the late Florentine style. His work on the 'Vite de' più eccellenti Pittori, Scultori ed Architetti' ('Lives of Painters, Sculptors, and Architects') is of great value. He, however, fell into many errors respecting the earlier masters, owing to the imperfection of existing accounts; and he has also been accused of partiality toward Tuscan artists. The work was first printed in 1550, and an enlarged and improved edition appeared in 1568. The latter forms the basis of all subsequent editions, such as that of Milanesi (Florence, 8 vols. 1878). An English translation by Mrs. Foster has been published in five volumes; another is to be found in the Bohn Library; and a third, by Blashfield, is published in New York.

Vasco da Gama, vās'kō dā gā'mā. See GAMA, VASCO DA.

Vasconcellos, vās-kōn-sē'l'ōs, **Antonio Augusto Teixeira de**, Portuguese author: b. Oporto 1 Nov. 1816; d. Paris 29 July 1878. He studied at the University of Coimbra, and in 1845 edited the 'Ilustração.' During the insurrection of the following year he became an officer of ordnance under Sa da Bandeira, and afterward prefect of Villa Real, secretary to the

junta, and editor of the 'Revolução de Setembro.' In 1850 he went to Angola, and settling afterward at St. Paul de Loanda, was elected president of the municipal body there. Returning to Portugal he founded in 1853 a journal called the 'Arauto.' He fixed his residence later in Paris and established in 1858 the Iberian society for the purpose of publishing works relating to Portugal, Spain, and Brazil. Among his works are: 'Carta philosophica do Estado da Historia Portuguesa' (1840); 'Roberto Valença,' a romance (1846); 'Carta do Trafico dos Escravos na Provincia d'Angola' (1853); 'Le Portugal et la Maison de Bragança' (1859); and 'A Fundação do Monarchia Portuguesa' (1860).

Vasconcellos, Joaquim Antonio da Fonseca e, Portuguese critic: b. Oporto 10 Feb. 1849. He studied at Coimbra, traveled widely on the Continent, in 1883 became professor of the German language in the Oporto Lycée, and in 1884 was made also director of the museum for industry and trade. His first work was a history of Portuguese music, 'Os Musicos Portuguezes' (1870). Other works of his on the history of musical art in Portugal were: 'Luiza Todi' (1873); 'Ensaio sobre o Catalogo da Livraria de Musica de El-Rei D. João IV.' (1873), and 'Cartas Curiosas do Abade Antonio da Costa' (1879). On the graphic arts he wrote: 'Reforma do Ensino de Bellas Artes' (1877-9); 'Albrecht Dürer e a sua Influencia na Peninsula' (1877); 'Francisco de Hollanda' (1879), and 'Goesiana' (1879-81).

Vasconcellos, Simão, Portuguese missionary and historian: b. Coimbra 1599; d. São Paulo province, Brazil, about 1670. A member of the Jesuit order, he was sent to Brazil about 1630, and remained connected with the missions there. He wrote a 'Cronica da Companhia de Jesus no Brazil' (1663; 2d ed. 1864), a 'Vida de João Almeyda' (1665), and 'Vida de Jose Anchieta' (1666). These works are regarded as important sources for both the secular and the ecclesiastical history of early Brazil. Some of Vasconcellos' unpublished manuscripts are in the government archives of Brazil.

Vaseline, a useful product obtained by an elaborate system of filtration from crude petroleum. It is a pale-yellow, translucent, slightly fluorescent, semi-solid, insoluble in water, slightly so in alcohol, freely in ether, and may be mixed in any proportion with fixed and volatile oils. This substance, of American introduction, has since 1876 become of considerable importance, having been found an excellent substitute for lard in the preparation of ointments—its quality of never getting rancid giving it a decided value in all medical preparations over the animal fats—and it seems to furnish a good basis for soaps, pomades, cold-creams, etc., thus disputing the virtues of glycerine as an emollient. Taken internally it is said to be of efficiency in the cure of coughs, colds, hoarseness, and irritation of the throat. It is extensively used in hospitals as a remedy for burns and scalds, to prevent pitting in smallpox, and for every kind of skin disease, inflammation, and irritation.

Vases, vessels of various shapes and materials, generally with one or more handles, variously decorated and ornamented by means of pigments or otherwise, and used for many

VASEY

purposes. All peoples who have made decorative ceramic ware have produced vases, large or small, and decorated according to the style in use. Moreover, vases of bronze, pewter and other materials are constantly made, and the term is extended to apply to decorative objects which are not hollow, but which have the appearance only of real vases. Thus in architectural accessories, vases cut solid in marble are used for the decorative treatment of parapets, balustrades and the like, and are set on the blocking-course above the cornice on many a large building. Again, vases of this character, purely decorative and not hollow to any available extent, are sometimes sculptured in the richest fashion, and Græco-Roman objects of this sort are among the most cherished relics of antiquity. In this article it is proposed to treat only the Greek and Græco-Roman vases of terra cotta, the study of which is so important to the archaeology and also to art study as being our chief means of forming an idea of the last painting of the ancients. The scientific study of ancient vases — especially those of earthenware or terra cotta — as a branch of archaeology, is of comparatively recent origin, but it has already shed much light on the life of antiquity. Vases are to be classified according to their shape, as *hydriæ*, water-pots; *lecythi*, bottles; *cylixes*, bowls; *kelebes*, stalked bowls; *amphoræ*, jars; *canthari*, wine cups; *crateres*, mixing bowls; *aryballi*, round bottles; *cenochoc*, wine-jugs. Most of the ancient peoples have left numerous vases distinctive of their national character and civilization, but the most important by far are those of the Hellenic world, which have been found not only in Greece, but also in Asia Minor, Etruria, South Italy, Sicily, the Ægean and other Mediterranean islands, North Africa, and elsewhere. Hellenic vases may be grouped, according to the period of production and artistic type, in four classes, namely: (1) archaic and early; (2) black figured Athenian; (3) white-surfaced Athenian *lecythi*; (4) red-figured Athenian; (5) decadence, which forms a large class, as the many varieties. They are of a very rude type, being hand-made and unpainted, mostly without handles, though often having pierced projections for the purpose of suspension, and either undecorated or adorned only by means of incised lines and clay strips. The island of Thera (now Santorin) has yielded great numbers of vases of a rather more advanced type. These vases are ornamented with figures of plants and animals in dull colors, and have been made wholly by means of the potter's wheel. The ware known as Mycenaean has been unearthed not only in the neighborhood of Mycenæ, but also elsewhere on the mainland of Greece, on some of the Ægean islands, and in Rhodes and Crete. In the earlier specimens the colors are dull, but the later vases of this type are ornamented with more brilliant colors. The geometric style of ornamentation which begins to appear in the Mycenaean vases is found fully developed in the Dipylon vases found at Athens. This influence is at its height in the Rhodian group, of which the best known specimen is the *pinax* or platter in the British Museum representing the combat of Menelaus and Hector over the body of Euphorbus. The Corinthian group of vases which belong to the period of decadence, is also strongly Oriental in the style of the ornamentation. These have been found not only at Corinth and in other parts

of Greece, but also in Etruria, notably at Cære. The Etruscan examples, however, were of Corinthian origin, at least in the main, though there is also a native Etruscan pottery of a different type. The most notable example of Corinthian ware is the Dodwell *pyxis* now in the Munich Pinakothek. The Corinthian are the earliest vases signed by their makers. About the 5th century Athens began to assume the lead in vase-making, and soon Corinth and other towns were driven from the Italian market. The earlier Athenian vases have usually a red, slightly glazed clay ground on which the figures are painted in glossy black enamel, touched up with red and white in certain parts. The designs are mainly mythological. The finest work of this black-figure period is the Francois vase found at Chiusi, now in the Florence Museum, which is signed by Ergotimus the potter and Clitias the painter. The most productive vase-maker of this time is Nicosthenes, from whom we have about 70 vases, mostly found in Etruria. A special type of black figure vase is the Panathenaic amphora, which was presented as a prize at the Panathenaic games. After a period of transition black-figure vases were almost entirely displaced by red-figure ones (about 500 B.C.), in which the art reached its zenith. The painters now broke with convention, and often substituted scenes from everyday life for the well-worn mythological incidents. Great simplicity, refinement, and purity of taste characterize the best vases of this period. Several styles of red-figure vase-painting have been distinguished, such as the severe style, represented by the productions of Sosias, Euphronios, Duris, and Brygos; a more graceful style, well represented by the Nola amphoræ in the Naples Museum; the Attic style of perfect elegance, of which the finest examples are the small *aryballi* found at Cumæ and at Aexone in Attica (now in Naples Museum); the white *lecythi* found in Attic tombs; and the beautifully gilded polychromic vases dating from the 4th century B.C., well represented by the *pelike* of Camirus in the British Museum and by a vase from Cumæ now in Saint Petersburg. In vases of the decadence, ornamentation becomes overdone and tasteless, and ultimately, about 100 B.C., painted vases practically ceased to be made. Late vases have been found chiefly in South Italy and Sicily. Ancient vases were also made of metal, glass, alabaster, etc.; a famous glass vase being the Portland Vase (which see). See CERAMICS; POTTERY.

Vasey, vā'sī, George, American botanist: b. near Scarborough, Yorkshire, England, 28 Feb. 1822; d. Washington, D. C., 4 March 1893. He was brought to this country in infancy by his parents, studied medicine at the Berkshire Medical Institute, Pittsfield, Mass., and practised his profession in Elgin and Ringwood, Ill., 1848-66. He was the botanist of the Powell Colorado Exposition in 1868 and of the Department of Agriculture at Washington from 1873 till his death. He gave his attention in his latest years almost entirely to the study of grasses, to which his publications chiefly relate. Among them are: 'A Catalogue of the Forest Trees of the United States' (1876); 'Agricultural Grasses of the United States' (1884); 'Grasses of the Southwest' (1890-1); 'Grasses of the Pacific Slope' (1892-3).

VASQUEZ DE CORONADO — VASSAR COLLEGE

Vasquez de Coronado, vās-kēth' dā kō-rō-nā'dō, **Francisco**. See CORONADO, FRANCISCO VASQUEZ DE.

Vasquez de Coronado, Juan, Spanish administrator: b. Salamanca, Spain, about 1525; d. at sea, October 1565. He came of a distinguished family, was educated at the University of Salamanca and in 1550 went to Guatemala. He was employed in various important government posts at San Salvador, Honduras, Nicaragua, and Guatemala and in 1562 was appointed *alcalde ordinario* of the provinces of Cartago and Costa Rica. His administration was noteworthy for its many admirable results. He procured provisions for the needy settlers, brought order out of chaos in governmental affairs, made friendly advances to the Indians, whose good will he won by his unvarying kindness and impartiality, explored Costa Rica, founded several towns, including Cartago, and in 1564 returned to Spain, leaving the colony in a most satisfactory condition. In recognition of his services he was appointed captain-general of Costa Rica, the office to remain hereditary in his family, and was also made governor of Nicaragua for three years. He sailed with a large following in 1565, but met with shipwreck and was drowned in October of that year.

Vassalboro, vās'al-būr-ō, Maine, town on the Kennebec River and on the Maine Central railroad; 11 miles northeast of Augusta. It was settled in 1760, and in 1771 was incorporated. In 1792, a part of the town was taken for the town of Sidney. There are six villages in the town. The chief manufacturing establishments are flour mills, machine shops, and creameries. There are nine churches. The educational institutions are Oak Grove Seminary, public schools, a business college, and a school library. Pop. (1890) 2,052; (1900) 2,062.

Vassar, vās'ar, Matthew, American philanthropist: b. East Dereham, Norfolk, England, 29 April 1792; d. Poughkeepsie, N. Y., 23 June 1868. He came with his father to this country in 1796, and settling near Poughkeepsie the elder Vassar established there a brewery, which was burned in 1811. Matthew Vassar then established himself in the same business and in time accumulated a large fortune. In February 1861, he delivered to trustees previously appointed for the purpose by the State legislature the sum of \$428,000 for the founding of Vassar College (q.v.). Consult Lossing, 'Vassar College and its Founder' (1867).

Vassar, Matthew, Jr., American philanthropist, nephew of the preceding: b. Poughkeepsie 11 May 1809; d. there 10 Aug. 1881. With his brother, J. G. Vassar, he built the Vassar Brothers' Laboratory for Vassar College, and he also erected the Vassar Home for Old Men at Poughkeepsie. He managed the family brewery business for many years and among his many benevolent bequests were the sum of \$130,000 for Vassar College, and \$85,000 for the Vassar Brothers' Hospital at Poughkeepsie.

Vassar, Mich., village in Tuscola County; on the Cass River, and on the Michigan C., and the Flint & P. M. R.R.'s; about 75 miles, in direct line, north by west of Detroit and 25 miles southeast of Bay City. It is in an agricultural region and has considerable manufacturing interest connected with lumbering. The chief

manufacturing establishments are lumber mills, flour mills, machine shops, woolen mills, creameries, and foundries. The two banks have a combined capital of \$60,000 and deposits amounting to \$315,000. The educational institutions are a high school, graded schools, and a school library. Pop. (1890) 1,682; (1900) 1,832.

Vassar College, a college for women located at Poughkeepsie, N. Y. It was founded in 1861 by Matthew Vassar; his original gift to the college was 200 acres of land and \$428,000; this was increased by his bequest of \$360,000. The aim of the founder was to establish an institution which should "accomplish for young women what our colleges are accomplishing for young men." Vassar was the first institution of higher learning for women incorporated as a college and equipped to do full college work. The name under the charter of 1861 was Vassar Female College, which in 1867 was changed to Vassar College. The college is non-sectarian. The requirements for admission are the same for special students as for the regular students. The degree of A.B. is conferred for the completion of the four years' course. The work of this course is prescribed for the Freshman year, partially elective in the Sophomore year, and entirely elective for the last two years except for one required course in psychology in the Junior year, and one in ethics in the Senior year. Bible study, and two courses in the history and theory of education, are included in the curriculum; in addition a regular series of lectures is given on methods of teaching the various subjects of the school curriculum. Courses in the history and the theory of art and music are included among the regular courses counting toward the degree, Vassar being one of the first colleges to include such courses in the curriculum. Technical instruction in music is provided, but does not count toward the degree; the music department maintains a choral club and a symphony orchestra. Graduate work leading to the degree of A.M. is also provided. There are seven graduate scholarships and one fellowship, 34 undergraduate scholarships, two general student aid funds, one special fund for missionaries' daughters, and a students' loan fund. The discipline is by a system of self-government under the charge of the Students' Association, a general organization of all students. The students also maintain a Young Women's Christian Association, two debating societies, the Philaethan Society (dramatic), an Athletic Association, the Thelkla Club (musical), and a number of literary societies and social clubs; a chapter of Phi Beta Kappa was organized in 1899. The campus consists of 210 acres, just outside the city of Poughkeepsie, about three miles back from the river; the buildings include the Main Building (500 feet in length), Strong Hall, Raymond House, Edward Lathrop Hall, and Eliza Davidson House (four dormitories), Rockefeller Hall, containing the recitation rooms and two auditorium halls, Vassar Brothers Laboratory (chemistry and physics), the New England Building (biology, geology, and physiology), the museum, the observatory, the infirmary, and the Alumni Gymnasium; a library building and a chapel were in process of construction in 1904. A certain amount of gymnasium work is required of all students and outdoor sports are encouraged; an annual field-day is held. In 1902 John

VATHEK—VATICAN COUNCIL

D. Rockefeller offered to duplicate any sums to the amount of \$100,000, which should be raised for a general endowment fund before 1905; an organized movement was immediately begun for the raising of the largest possible endowment. In 1904 the library contained over 50,000 volumes; the students numbered 865, and the faculty 78.

Vath'ek, The History of the Caliph, an Oriental romance by William Beckford, written in French in 1781 or 1782. This highly imaginative story appeared at Lausanne and Paris in 1787. An authorized translation from the French MS. ascribed to one Samuel Henley, appeared in London in 1786.

Vatican, the residence of the popes, and the most extensive palace of modern Rome, built upon the Vatican Hill, from which it has received its name, immediately to the north of the basilica of Saint Peter's. It is a long rectangular edifice lying north and south, with an irregular cluster of buildings at either end. The present building was begun by Pope Eugenius III. (1145-53), and has been enlarged and embellished by many subsequent popes down to Pius IX. (1846-78). It now possesses 20 courts and about 1,000 rooms of one sort or another. Great art treasures are stored up in it. Here are the celebrated collections of pictures, and the museums, in which all the periods of the arts are represented by many of their most perfect productions. Here are the *loggie* or arcades of Raphael, Bramante, and Giov. da Udine, and the *stanzas* or halls of Raphael; here are the Sistine and Pauline chapels (the former with Michelangelo's celebrated ceiling paintings representing the preparation of the world for the advent of Christ, and the 'Last Judgment' of the same painter on the altar wall); the *museo Chiaramonti*, with the Braccio Nuovo or new wing (founded by Pius VII., whose family name was Chiaramonti), and the *museo Pio-Clementino*, formed under Popes Clement XIV. and Pius VI.; the *museo Gregoriano* (of Etruscan antiquities, formed under Gregory XVI.); the Egyptian museum, the tapestries of Raphael; here is the rich Vatican library (described below); here are pictures of almost all the first masters of that glorious period of which Raphael is the chief ornament; and near it is the gigantic Saint Peter's. The Vatican has been used more or less as a place of residence by the popes since their return from Avignon in the latter part of the 14th century, and here the conclaves always meet for the election of new popes. The portion now occupied by the pope as a place of residence is the eastern wing of the court of Saint Damaso, in the southeast of the whole pile, the court surrounded by the loggie. Since the annexation of Rome to the kingdom of Italy, and the final effacement of the Pope's temporal power, the popes have remained entirely within the Vatican and the Vatican grounds, with their own guards and attendant ecclesiastics.

Vatican Library.—The collection of papal archives is known to have been begun as early as Pope Damasus I. (366-385), if not earlier, but Nicholas V. (1447-55) was the first to constitute a public library, for which Sixtus V. provided the great saloon (designed by Fontana), in which a large part of the library is still preserved. Leo X. devoted himself to the collection

of Greek, Pius IV. of Oriental manuscripts; Pius V. united the papal archives with the library; and various additions have been made since. In the suite of rooms allotted to the library are included the Museum of Christian Antiquities and the Stanza de' Papiri, the latter containing documents on papyrus from the 5th to the 8th century, and adorned with paintings by Raphael Mengs. The manuscript collection of the Vatican Library is by far the most important part of it. The number of MSS. is said to be over 26,000. The number of printed volumes has been estimated at from 150,000 to 220,000, including 2,500 15th-century editions, and a great number of bibliographical rarities. It is open for four hours per day on about 200 days in the year. See CATHOLIC CHURCH; PAPACY; ROME.

Vatican Council, or **Council of the Vatican**, the only plenary council of the Roman Catholic Church held since the Council of Trent in 1563. In June 1867, Cardinal Caterine sent a circular letter to the 500 bishops present in Rome at the celebration of the 18th centenary of the martyrdom of Saints Peter and Paul, inviting their replies relative to questions on points of discipline and other matters to be brought up in the proposed council. In September 1868, an invitation to attend the approaching Council was sent to Oriental bishops not in communion with the Roman Catholic Church, and to "Protestants and non-Catholics." The bull of convocation was promulgated on 29 June 1869, appointing 8 Dec. 1869, as the day of meeting. A few days before the latter date, on 27 November, Pius IX. issued the brief, *Multiplices inter*, prescribing the mode of conciliar procedure.

The Council, which assembled on the appointed day, 8 Dec. 1869, was the largest ever held, 749 cardinals, bishops, abbots and generals of religious orders being present, or nearly three fourths of the Roman Catholic episcopate. The number was afterward increased to 764. The invitation to non-Catholics and others not in communion with Rome, brought no response in the form of attendance. The Italian bishops numbered 170 and the Spaniards 40. On 10 December, at the first congregation of the Council, a bull was published decreeing that if the pope should die during the Council, that body should at once be prorogued, and take no part in the election of a pontiff, which duty was to rest with the College of Cardinals. Petitions were signed by many prelates, members of religious orders and lay Catholics, asking for the definition by the Council of the dogma of papal infallibility.

At the second session, 6 Jan. 1870, all the members present recited the Creed of Pius IV. pledging loyal obedience to the Roman Pontiff, and took the episcopal oath. The Cardinals-president of the congregation, on 20 February, issued rules which should govern the debates of the Council, and the "Constitution on the Faith," known as *Dei Filius*, was formulated and adopted. It is chiefly directed against modern rationalism. All the 667 members present signed this Constitution, and it was promulgated at the third session, 24 April 1870, with papal confirmation.

Next followed the most important work of the Council, a decision that should put an end to all discussion on the subject of papal infallibility, already accepted as a dogma by the vast

VATICAN PALACE—VAUD

majority of the Church. The Constitution now generally known as *Pastor Aeternus* asserted the following propositions: (1) that a proper primacy of jurisdiction over the whole Church was conferred upon Saint Peter directly and singly, and not mediately through any delegation to him, as chief minister of the Church, of a primacy held by the Church corporately; (2) that this Petrine primacy vests only by Divine institution and right in the line of Roman pontiffs; (3) that the pope's jurisdiction is immediate in all churches—that is, he is the universal ordinary, the actual bishop of every see (all other bishops being merely his curates and deputies), and is not a remote or merely appellate authority—so that in questions not of faith and morals alone, but of discipline and government also, all the faithful, of whatever rite or dignity, both pastors and laity, are bound, individually and collectively, to submit themselves thereto; (4) that it is unlawful to appeal from the judgments of the Roman pontiffs to an oecumenical council, as though to a higher authority; and (5) that the Roman pontiff, when he speaks *ex cathedra*, and defines a doctrine of faith or morals to be held by the universal Church, is infallible, and such definitions are accordingly irreformable of themselves, and not from the consent of the Church. This document was voted upon, 13 July 1870. Of the 671 members present 451 voted directly in the affirmative, 62 voted *placet juxta modum*, signifying approval with certain changes of expression, and 88 voted *non-placet*, but of these many objected not to the essence of the dogma, but to the time—one of great agitation in the political world—as inopportune for declaring it. After discussion the newly defined dogma was adopted at a public session, held 18 July 1870, when 535 voted in the affirmative and only two, the bishops of Ajaccio and Little Rock, answered “non-placet,” these afterward joining in unanimous adoption. The pope confirmed the action of the Council, and on 20 Oct. 1870, the Council was formally prorogued, instead of being dissolved. It is therefore technically still in existence. The year in which papal infallibility was declared to be a dogma of Roman Catholic faith witnessed the downfall of the pope's temporal power, the Italian government having taken possession of Rome 20 Sept. 1870, and Rome being proclaimed the capital of Italy, 9 Oct. 1870. See CATHOLIC CHURCH; PAPACY.

Vatican Palace. See VATICAN.

Vauban, vō-băn, **Sebastien le Prestre**, SEIGNEUR DE, marshal of France, French military engineer: b. St. Léger de Towcherets, near Avallon, Burgundy, 1 May 1633; d. Paris 30 March 1707. He early entered the army, where his uncommon talents and genius for fortification soon became known, and were signally displayed in various successive sieges. He introduced the system of approach by parallels at the siege of Maestricht (1673), and distinguished himself at Oudenarde, Valenciennes, and Cambrai. He rose to the highest military rank by his merit and services, and was made governor of the citadel of Lille in 1668, and commissioner-general of fortifications in 1677. He was made marshal of France in 1703. As an engineer he carried the art of fortifying, attacking, and defending towns to a degree of perfection unknown before his

time. He fortified above 300 ancient citadels, erected 33 new ones, and had the principal management and direction of 53 sieges. Among the principal places fortified by him are the port of Dunkirk, and the citadels of Lille, Metz, and Strasburg. He was the inventor of the socket bayonet and ricochet batteries. His works consist of a treatise entitled ‘*Projet d'une Dixme Royale*’ (1707; new ed. 1877), and a vast collection of manuscripts, in 12 volumes, which he called ‘*Mes Oisivetés*,’ containing his ideas, reflections, and projects for the advantage of France. Three volumes extracted from the ‘*Oisivetés*’ were published at Paris in 1842-3.

Consult: Chanbray, ‘*Notice Historique sur Vauban*’ (1845); Michel, ‘*Histoire de Vauban*’ (1879); Lloyd, ‘*Vauban, Montalembert, Carnot: Engineer Studies*’ (1887); Lohmann, ‘*Vauban, seine Stellung in der Geschichte der National-ökonomie*’ (1895).

Vaucanson, Jacques de, zhāk də vō kăn sôn, French mechanician: b. Grenoble 24 Feb. 1709; d. Paris 21 Nov. 1782. He earnestly studied mechanics and anatomy for several years, and it is chiefly to his automata that he owes his fame. (See AUTOMATON.) Cardinal Fleury appointed him inspector of silk manufactures, and in consequence of some improvements which he made in the machinery he was at one time pelted with stones by the workmen of Lyons, who feared a lessening of the profits of their labor. He revenged himself by constructing an automaton ass which wove flowered silks. His valuable collection of machines and automata he bequeathed to the queen; and as she paid no attention to the legacy, a strife arose for their possession between the intendants of commerce and the Academy of Sciences, of which Vaucanson was a member, and they were in consequence either destroyed or scattered.

Vaucluse, vō-klüz, France, a southeastern department, bounded north by Drôme; east by Basses-Alpes; south by the Durance, separating it from Bouches-du-Rhône; and west by the Rhone, separating it from Gard; area, 1,381 square miles. The surface has a general inclination to the south and west, and all the eastern portion is rugged and mountainous. More than one half of the whole surface is arable, and vineyards occupy about one sixth of this portion. Some of the wines bear a good name, and are extensively exported to Switzerland and Germany. A good deal of ground is occupied by the mulberry for the rearing of silkworms, and olive. Madder also is cultivated on a large scale, and considerable attention is paid to the rearing of aromatic and medicinal plants. Sulphur and coal are the most important minerals. The manufactures consist chiefly of silk stuffs, machinery, leather, beer and spirits, paper, cloth, etc. For administrative purposes Vaucluse is divided into the four arrondissements of Avignon, Apt, Carpentras, Orange. The capital is Avignon. Vaucluse takes its name (*Vallis clausa*) from the valley and village of that name rendered celebrated by Petrarch. Pop. (1901) 235,457.

Vaud, vō (Ger. WAADT, vāt), Switzerland, a canton bounded north by the canton and lake of Neuchâtel, west by France, south by the canton and lake of Geneva, and east by Fribourg, Bern, and Valais; area, 1,247 square miles.

The mountains include the Alps, in which are the culminating points of the canton, in the southeast; the Jura in the west; and the Jorat, stretching to the north of the Lake of Geneva and forming a connecting link between the other two. Vaud belongs partly to the basin of the Rhine and partly to that of the Rhone, the Jorat forming the water-shed which separates them. The principal river is the Broye. The climate is temperate and salubrious. Salt, marble, coal, and building-stone are worked, and there are mineral springs. The soil in general is not of remarkable fertility. Along the banks of the Lake of Geneva the culture of the vine is extensively carried on, and much wine of a fair quality is made. The manufactures comprise condensed milk, tobacco and cigars, clocks, musical boxes, chocolate, and ironwares, and the trade is of some importance. Lausanne is the capital, and among other towns are Vevey, Yverdon, Payerne, and Avenches. The inhabitants are almost all Protestants, and education is very generally diffused. The greater part of Vaud belonged to Savoy, till in 1536 it was conquered by the Bernese, to whom it remained subject till 1798, when it freed itself with the aid of the French. It became a canton of the Swiss Confederation by the act of mediation in 1803. Pop. (1900) 279,152.

Vaudeville, vōd'vil, a corruption of Val de Vire, the name of a picturesque valley in Normandy. One Olivier Basselin, a fuller in Vire, composed about the middle of the 15th century a number of humorous and more or less satirical drinking-songs, which were very popular, and spread over France, bearing the name of their native place. Latterly the term has been applied to a mixed musical and dramatic performance.

Vaudreuil, Louis Philippe de Rigaud, loo-ē fē-lēp dē rē-gō vō-dre-y, or vō-drēl-y, French naval officer: b. Rochefort 28 Oct. 1724; d. Paris 14 Dec. 1802. As a lieutenant he fought brilliantly against the English in an unequal combat in the bay of Audierne 19 May 1759. In 1777 he was made vice-admiral, in 1779 aided in the siege of Savannah, in 1780 commanded a division at the French victory over the British in the channel of Dominica (17 April; 15-19 May), and in that year was made governor of Santo Domingo. This post he soon resigned, and he participated in the action between de Grasse and Graves at the mouth of Chesapeake Bay (5-10 Sept. 1781), and in the siege of Yorktown. On 12 April 1782 he assisted in the battle with Rodney in the Saintes Islands channel, in August was promoted lieutenant-general, in 1789 was sent to the States-General, in 1791 emigrated to Great Britain, but during the consulate returned to France. Consult Hennequin, 'Biographie Maritime' (1835-7).

Vaudreuil Cavagnal, kā-vān-yāl, Pierre François de Rigaud, pē-ār frāñ swā dē rē-gō, MARQUIS DE, French naval officer, governor of New France: b. Quebec 22 Nov. 1698; d. Paris 20 Oct. 1765. He became major in the marine corps, was made governor of Three Rivers in 1733, and of Louisiana in 1742. In 1755 he was appointed governor-general of Canada. Parkman gives a very unfavorable picture of Vaudreuil and his administration. He did all that he could to hamper Montcalm, and thus

hasten the downfall of French power. His capitulation at Montreal was disapproved by the French authorities, and he was imprisoned and tried, but acquitted. Consult Parkman, 'Montcalm and Wolfe' (1884; new ed. 1898).

Vaughan, vān or vā'an, Charles John, English Anglican clergyman: b. Leicester 1816; d. Llandaff, Wales, 15 Oct. 1897. He was educated under Arnold at Rugby, and at Trinity College, Cambridge, took holy orders in 1841, and was successively vicar of St. Martin's, Leicester (1841-4), head-master of Harrow (1844-59), vicar of Doncaster (1860-9), master of the Temple (1869-94), and dean of Llandaff from 1879. While at Harrow he did much toward increasing the efficiency of that school, and as master of the Temple became known for pulpit eloquence, and was conspicuous as one of the leaders of the Broad Church party. He married a sister of Dean A. P. Stanley (q.v.). Among his 40 or more published volumes are 'Harrow'; 'Temple'; and 'University Sermons'; 'Commentaries on Acts, Revelations, Philipians'; 'Family Prayers'; 'Discourses on Liturgy and Worship'; 'Addresses to Young Clergymen'; 'The School of Life.'

Vaughan, Henry, Welsh poet: b. Newton, parish of Llansaintfraed, Brecknockshire, 17 April 1622; d. there 23 April 1695. By contemporaries he was styled 'The Silurist,' because his native region was among the Silures, or folk of South Wales. He was educated at Jesus College, Oxford; and after studying the law for a time in London, abandoned it for medicine, and practised with much success and reputation first at Brecknock and later at Newton. It appears that he was imprisoned for his loyalty at the Revolution, and that he was present at the battle of Rowton Heath—it may be as surgeon with the royalist army. His first volume was 'Poems, with the Tenth Satyre of Juvenal Englished'—a free rendering (1646). This he followed by 'Olor Iscanus'—'Swan of the Usk' (1651), the chief portion of the volume being a eulogy of that river. Thereafter his verse took on a predominantly religious and devotional cast and greatly improved in poetical quality. In 1650 appeared the first part of 'Silex Scintillans'—'Sparks from the Flint,' described in its subtitle as made up of 'sacred poems and private ejaculations,' and completed in 1655 by the addition of a second part containing what are probably his best-known stanzas—"They are all gone into the world of light." One 'J. W.' collected (1678) various elegies, translations, and other productions as 'Thalia Rediviva'; and Vaughan also published some books of prose, among them 'The Mount of Olives' (1652), a work of devotion. Garnett thinks Vaughan less frequently than Herbert displays the curious absurdities and attempts at wit so much affected in the verse of the time. He abounds in occasionally felicitous phrases and lines—like, as he said, "unanticipated sparks from a flinty ground." A few of his poems have been given by critics a very high place in literature. He was practically unknown until H. F. Lyte edited the sacred poems only in 1847. A complete edition of his works is that of Grosart (1871); of the poems, that of Chambers (1896). Consult the memoirs in these editions; also the essay in Brown, 'Horæ Subsecivæ,' series i. (1858).

VAUGHAN — VAUVENARGUES

Vaughan, Herbert, English Roman Catholic prelate: b. Gloucester 15 April 1832; d. London 20 June 1903. He was educated at Stonyhurst College and on the Continent; was ordained to the priesthood in 1854; founded Saint Joseph's College for foreign missions at Mill Hill, Hendon; visited Maryland as a missionary to the negroes; and in 1872 was consecrated bishop of Salford. On Manning's death he was appointed (1892) archbishop of Westminster, and shortly afterward was made cardinal. He was a preacher of much eloquence, and proprietor of the 'Dublin Review' and the 'Tablet.' He displayed a marked interest in the temperance cause and in commercial education among Roman Catholics, building for this latter purpose Saint Bede's College.

Vaughan, Victor Clarence, American physician and educator: b. Mount Airy, Mo., 27 Oct. 1851. He was graduated from Mount Pleasant College in 1872, became instructor in the University of Michigan 1876 and professor in 1880. He served in the Santiago campaign as major and surgeon. He has published: 'Osteology and Myology of the Domestic Fowl' (1876); 'Text-book of Psychological Chemistry'; 'Ptomaines and Leucomaines' (with Dr. Novy), etc.

Vaughan, Sir William, English poet and colonial planter: b. Golden Grove, Carmarthenshire, 1577; d. Torcoed, England, August 1641. He was educated at Oxford, graduated in law, and in 1625 became a physician. He founded the settlement named Cambriol at Newfoundland, concerning which he wrote 'The Golden Fleece, divided into Three Parts, etc., by Orpheus, Junior' (1626), a quaintly written combination of prose and verse notable as the first volume of poetry written in the North American colonies. He returned to England in 1625. He was also author of 'Cambrensiūm Caroleia' (1625).

Vaught's Hill, Engagement at. On 18 March 1863 Col. A. S. Hall, with a brigade of Union infantry of 1,300 men and two guns, was sent from Murfreesboro to look after Gen. John H. Morgan, who was raiding the country to the northeast. Beyond Statesville, Hall ran into the Confederate skirmishers, and these, being pressed back, disclosed Confederate cavalry in position. Learning also that Morgan, with a large force, was preparing to attack him, Hall fell back to Vaught's Hill, a steep cedar-wooded height, near Milton, about 13 miles from Murfreesboro. He was closely followed by Morgan with about 2,500 men and a battery of artillery, who made an attack at 11.30 A.M., on the 20th, before Hall had fairly taken position. Morgan's larger numbers permitted him to attack both Hall's flanks and rear, but he could gain no further advantage, and after an engagement of nearly four hours, in which he was several times repulsed, he finally withdrew, leaving his dead and many wounded on the field. His loss was 30 killed and 150 wounded, the loss in officers being very heavy. The Union loss was 6 killed, 42 wounded, and 8 missing. Consult 'Official Records,' Vol. XXIII.

E. A. CARMAN.

Vault, in architecture, a continued arch, or an arched roof, so constructed that the stones, bricks, or other material of which it is composed, sustain and keep each other in their places. Vaults are of various kinds, cylindrical,

elliptical, single, double, cross, diagonal, Gothic, etc.

Vauquelin, vō-kē-lān, Louis Nicolas, French chemist: b. near Caen, Normandy, 16 May 1763; d. 14 Nov. 1829. He studied pharmacy, and became known to Fourcroy, who presently made him his assistant in his philosophical researches and lectures. After being chief pharmacist in the military hospital at Melun in 1793, he was appointed inspector and professor of docimacy in the mining school at Paris and then assistant professor of chemistry in the polytechnic school, and a member of the French Institute. He succeeded Darcet in the chair of chemistry at the College of France, and resigning his inspectorship of mines, became director of the school of pharmacy just established by the government. On the death of Brongniart he received the professorship of chemistry in the Jardin des Plantes, and succeeded Fourcroy in the same capacity in the faculty of medicine. He had remarkable talents for analysis; his discoveries, among which those of chromium and glucina deserve special notice, have been useful in various branches of art and science. His 'Manuel de l'essayeur' (1812) has been superseded, but his 'Mémoires,' amounting to more than 250 in number, and printed in the 'Annales de chimie,' the 'Journal des mines,' the 'Annales du muséum,' and the 'Recueil de l'académie des sciences,' are still valuable.

Vautier, vō-tē-ā, Benjamin, Swiss painter: b. Morges, on the Lake of Geneva, 24 April 1829; d. 1898. He began his art training at Geneva and for some years earned his living as an enameleur of metal ornaments. In 1850 he joined the classes of R. Jordan at Düsseldorf, and began his study of peasant life in the highlands of Bern. In 1856 he went to Paris, and on his return to Dusseldorf produced the first of his Bernese pictures 'The Interior of a Swiss Village Church, with Worshippers.' From that time he gradually gained the reputation of one of the first Swiss genre painters by the series of pictures in which he portrayed scenes from peasant life not only in Switzerland but in Swabia and Bavaria. His works are all distinguished by faultless drawing, robust individuality; vividness in the delineation of local and national types, and they are, moreover, as is natural to the subjects treated of, brimful of delightful humor. As a colorist Vautier is master of harmony, and his composition is graceful and dramatic. Among the finest and most popular of his works may be mentioned: 'Card-playing Peasants Surprised by their Wives'; 'Sunday Afternoon in Swabia'; 'Toasting the Bride'; 'Country Funeral'; 'Black Peter'; etc. He was also successful as an illustrator of books and his designs for Immerman's 'Oberhof'; Auerbach's 'Barfüssle' and for 'Hermann und Dorothea' have been much admired. Consult Rosenberg, 'Benjamin Vautier' (1897).

Vauvenargues, vōv-nārg, Luc de Clapier, MARQUIS DE, French moral philosopher: b. Aix, Provence, 6 Aug. 1715; d. Paris, 28 May 1747. He entered the army in 1733, but resigned with broken health at 27. As a philosopher he inclines to the Stoic school, and his work was warmly praised by Voltaire, of whom he was a friend; but popular appreciation of his writings came only after his death. He wrote 'Introduc-

VAUX—VEDANTA PHILOSOPHY

tion to a Knowledge of the Human Mind' (1746), followed by 'Reflections' and 'Maxims.' Consult Paléologue, 'Vauvenargues' (1890).

Vaux, vâks, Calvert, American landscape architect: b. London 20 Dec. 1824; d. Bensonhurst, L. I., 19 Nov. 1895. He was educated in London, and in 1848 came to the United States as the assistant of A. J. Downing (q.v.), the celebrated American landscape-designer, whose partner he became in 1851. He assisted in laying out the grounds surrounding the Capitol and Smithsonian Institution at Washington, and in partnership with F. L. Olmsted (q.v.) he laid out Central Park in New York. In 1865 his design for Prospect Park, Brooklyn, was accepted and he was subsequently engaged with Mr. Olmsted in laying out parks in Chicago, Buffalo, the State reservation at Niagara Falls, and at other cities and towns throughout the United States. They laid out Riverside and Morningside parks in New York, Vaux becoming landscape architect of the public parks in 1881. He designed the Museum of Natural History (1873) and the Metropolitan Museum of Art (1874) in New York, besides other public buildings. To him is due credit for the artistic and original treatment of the transverse roads in Central Park. He wrote: 'Villas and Cottages' (1857).

Vaux, Richard, American lawyer: b. Philadelphia, Pa., 19 Dec. 1816; d. there 22 March 1895. He was admitted to the bar in 1836, soon after was sent as bearer of despatches to the United States minister in London, and on his arrival there was appointed secretary of the legation. In the following year he went to Brussels to assist in reorganizing the United States embassy there, and later returned to London where he was appointed private secretary to the United States minister, Andrew Stevenson. He returned to the United States in 1839, was recorder of deeds at Philadelphia in 1842-9. In 1843 he was appointed inspector of the State prison and was also elected comptroller of the public schools, thus occupying three important public offices at the same time. He was elected mayor of Philadelphia in 1855, became president of the board of directors of Girard College in 1859, was largely instrumental in securing, in 1885, the present charter of Philadelphia, and in 1890 was elected to Congress. He published: 'Recorder's Decisions' (1845); and 'Reports of the Penitentiary' (45 vols. 1842 et seq.).

Vaux, Thomas, LORD, English poet: b. Harrowden, England, 1510; d. October 1556. He was educated at Cambridge, succeeded to the barony at 13, and accompanied Cardinal Wolsey on his embassy to France in 1527. In 1530 he took his seat in the House of Lords, attended Henry VIII. to Calais and Boulogne in 1532, and in 1533 was created Knight of the Bath and appointed captain of the island of Jersey, an office he resigned in 1536. He occupied his seat in the House of Lords until 1555. Such of his verse as survives consists in the main of lyrics, which were much admired in their day. In 'The Paradise of Dayntie Devises' appear several of his poems, the best of which, 'The Aged Lover renounceth Love' and 'The Assault of Cupid' were previously published in Tottin's 'Miscellany' (1557).

Vauxhall (vâks'hâl) Gardens, in London, formerly a fashionable place of entertainment and summer resort situated near the Thames, in the parish of Lambeth, about 1½ miles from Westminster Bridge. They are now removed and built over.

Vav'asour, or Valvassor, in feudal times, a person of rank next below a baron; one who held his lands not from the crown but of one of the higher nobility. See FEUDALISM.

Vaw'ter, Charles Erastus, American educator: b. Monroe County, W. Va., 9 June 1841. He served in the Confederate army in 1861-5, obtaining a captaincy in the "Stonewall" brigade; was graduated from Emory and Henry College (Emory, Va.) in 1866; studied also at the University of Virginia (Charlottesville); and was professor of mathematics at Emory and Henry from 1868 to 1878. In 1878 he became superintendent of the Miller Manual Labor School at Albemarle, Va. He is considered an authority on manual training in the Southern States.

Veader, vë'a-dër, or Veadar, an additional or supplementary month of the Jews, added sometimes after the third, sometimes after the second sacred year, care being taken that the seventh year should have no such month appended to Adar.

Veb'len, Thorstein B., American publicist. He was graduated from Carleton College, Minn., in 1880, studied later at Johns Hopkins and Yale, was instructor in political economy at the University of Chicago 1896-1900, and has been professor of the same there since 1900. He is editor of 'The Journal of Political Economy' and has published 'The Theory of the Leisure Class' (1899); 'The Theory of Business Enterprise' (1904).

Vecchi, vëk'ë, Augustus Victor, Italian naval writer: b. Marseilles, France, 1843. He was educated in the Royal Naval School at Genoa, rose to be lieutenant in the naval service (1866), and resigned in 1872. He published on naval subjects several works of history and fiction, using the pen-name "Jack da Bolina." The volumes include: 'Saggi Storico-Mari-nareschi' (1877); 'Leggende di Mare' (1879); 'Nuove Leggende' (1880); 'La Vita e le Geste del Generale G. Garibaldi' (1882); 'Ironie Blande' (1889); 'Bozzetti di Mare' (1897); 'Memorie di un Luogotenente di Vascello' (1897); 'L'Italia Marinare o il Lido della Patria' (1899). Vecchi was among the promoters of the Italian navy league (La Lega Navale).

Vec'tor, in mathematics. See RADIUS VECTOR.

Veda, vâ'da, the general designation of the ancient sacred literature of India. The word is from the Sanskrit root *vid*, "know," and signifies primarily "knowledge" or "science." It then came to be applied to the entire Hindu sacred literature as "the science." For a full discussion of the subject, see the article on VEDIC LITERATURE. See also INDIA—Religions.

Vedanta (vâ-dân'ta) Philosophy, a system of Brahmanic philosophy, first set forth in a work called the Vedânta, said to have been written more than 2,000 years ago, and described as containing the quintessence of the Vedas. This system is based, like that of the Eleatics among

the Greeks, upon the unity of all real existence. The sole real existence is denominated knowledge (*jñāna*), soul, or God. The best idea that we can form of this one existence is that it is light or glory. But this idea is inadequate, and indeed misleading, for the one real existence is none of the infinite number of modes of existence. The diversity of the universe, that is, the multiplicity of individual life and variety of external nature, is merely phenomenal, and has all proceeded from the one real being. It has done so by the exercise of a power or energy belonging to that being, which power is ignorance (*ajñāna*) or the negation of the very essence of that being. Ignorance has three qualities or "fetters," *sattwa*, *rajas*, and *tamas*, which may be translated pure cognition, lively emotion, and inertness; or goodness, passion, and darkness; or purity, foulness, and darkness. In accordance with these qualities ignorance operates, and its operation is twofold, first, enveloping the soul and giving rise to the conceit of personality or conscious individuality; and secondly, throwing round it the phantasmagoria of external nature, which latter is composed of the five elements: vacuum, air, fire, water, and earth. The soul may escape from these illusions, and return to the knowledge that it is the one, either by a gradual process or by immediate emancipation. A gradual emancipation may be obtained by an ascetic way of living, and the constant practice of religious duties. Immediate emancipation can result only from the entire extinction of all consciousness of outward things, through meditation on the one supreme spirit, Brahma. See Monier-Williams' 'Hinduism' (1877) for a brief *résumé* of the system; Colebrooke's 'Essays' (1873); Gough's 'The Philosophy of the Upanishads' (1882); Max Müller's 'Three Lectures on Vedānta Philosophy' (1894); and the translation in 'The Sacred Books of the East.'

Vedder, vĕd'ēr, David, Scottish poet: b. Deerness, Orkney, 1790; d. Edinburgh 11 Feb. 1854. He went to sea when very young, became captain of a whaler at 22, was appointed 1st officer of an armed cruiser in 1815, and in 1820 became tide-surveyor, an office he occupied until his retirement on a pension in 1852. He appears to have written poetry at an early age, but his first published verse was 'The Covenanters' Communion, and other Poems' (1828). His poetry is graceful and fluent, and possesses both humor and pathos. His work includes: 'Orca-dian Sketches' (1832); 'Life of Sir Walter Scott' (1832); 'Poems—Legendary, Lyrical, and Descriptive' (1842); 'Story of Reynard the Fox' (1852); etc.

Vedder, Elihu, American painter and modeler: b. New York 26 Feb. 1836. He studied painting with Mattison at Sherburne, N. Y., and in 1856 became a pupil of Picot in Paris. In 1857-61 he worked in Italy, then returned to the United States, where he found himself disqualified for enlistment as a soldier by a defective arm. Returning to Paris in 1865, he remained there till January 1867, when he went to Rome, where he has since resided. His subjects are mostly ideal, and his work is characterized by great imaginative power and originality, with boldness and intensity of expression, qualities which impart to it a heroic cast. His oil paint-

ings include the 'Phorcydes'; the 'Cumæan Sibyl' (see CUMÆ); 'The Greek Actor's Daughter'; 'Roman Girls on the Seashore'; 'Venetians on the Main'; 'The Lair of the Sea-Serpent'; 'The Roc's Egg'; 'The Crucifixion'; and others. His reputation was greatly increased by his illustrations of Edward Fitzgerald's 'Omar Khayyām' (1884), and his decorations, subsequent to 1892, are marked by his significant characteristics. Examples of his work in this style may be seen in the pieces called 'Good and Bad Government' in the Library of Congress, Washington, and in a panel which he executed for Bowdoin College.

Vedder, Henry Clay, American Baptist church historian: b. De Ruyter, N. Y., 26 Feb. 1853. He was graduated from the University of Rochester in 1873 and from the Rochester Theological Seminary in 1876. He was associate editor of 'The Examiner' 1876-92, and editor-in-chief 1892-4; and also edited 'The Baptist Quarterly Review' (1885-92). Since December 1894, he has been professor of church history in Crozer Theological Seminary, at Chester, Pa. Among his published works are: 'Baptists and Liberty of Conscience' (1883); 'The Decline of Infant Baptism' (1890); 'A Short History of the Baptists' (1891); 'American Writers of Today' (1894); 'The Decline of the Apostolic Succession in the Church of England' (1894); 'A History of the Baptists of the Middle States' (1898); 'The Baptists' (1903).

Vedic (vā-dīk or vē-dīk) **Literature**, the literature of the Vedas or sacred books of India. The language and literature of the Aryan invaders of India falls into two periods, the Vedic and the Sanskrit. Vedic is the English adjective formed from the noun *veda*, the native name for the literature. This word means "knowledge" (*vid* seen in Greek *φίδια* "we know," Latin *videre*, Gothic *witum*, "we know," English *wit*), which specializes in the sense of "the knowledge par excellence," "the sacred knowledge" in a way comparable with our designation of our sacred Scriptures as "the book," the Bible. This fact indicates at once the character of the literature. It is a religious literature, composed to meet the various needs of a complex religious system, and is consequently practical, not artistic in purpose.

The people among whom this literature originated were Indo-Europeans, who had entered the peninsula of India from the northwest. At the beginning of the Vedic period they were settled on the Indus and in the Punjab, and throughout the period the course of their conquests can be followed eastward across the Jumna to the valley of the Ganges. Owing to the uncertainty of all Indian chronology it is rarely possible to give exact dates to any monument of its literature. For the Vedic period this is especially true, the best that can be done is to fix the relative succession of certain classes of writings. The oldest works are collections of material, the composition of which must have extended over several centuries. For the oldest of these, the Rig Veda, the estimates of competent scholars vary from 4000 to 1000 B.C.—the probability being in favor of the centuries immediately preceding the latter date, on account of the impossibility of assuming too great a difference in time between the Rig Veda and the Avesta, the beginning of which cannot be

VEDIC LITERATURE

placed earlier than the beginning of the 6th century before our era. The close of the Vedic period may be approximately given as the beginning of the 2d century before Christ.

These people were worshippers of the various phenomena of nature, of which their chief deities were anthropomorphic precipitates (for details see Hopkins, 'The Religions of India,' Boston 1808, and the literature there cited). To these gods they offered sacrifices that they might give in return prosperity—rain, wealth in cattle and in sons, health, long life and finally safe escort to the kingdom of the dead where ruled Yama, the son of Vivasvant. They conceived also the idea that these material gifts could be made more acceptable to the gods, if accompanied by songs of praise and invocations that extolled the might of the gods and told of their wondrous works; that formulæ of magic potency were also employed is but natural. The very form of the invocations implies the existence of mythological legends, and it is inconceivable that so elaborate a ritual as existed at the time of the Rig Veda and even earlier in the Indo-Iranian period, could have been introduced and maintained without some tradition of the reasons for its existence, and directions for its proper performance. In short, in this earliest period we have existing side by side all the germs which developing at a later period and crystallizing at various times precipitated themselves in the three great types of Vedic literature, the Samhitās, Brāhmaṇas and Sūtras.

The religion had two aspects, a hieratic and a popular side. The first comprised the greater Vedic ceremonies, the so-called *ṛgveda*-sacrifices and centred about the oblation of the intoxicating drink *soma*; the second comprised besides the rites connected with the home life the *grhya* rites—(from *grha*, "a house"), the practices that were more distinctly magical in nature, whose objects were to bless and to curse. It remains to be noted that with the growing power of the priesthood, their influence reached out over this sphere also and gave to these originally popular ceremonies a quasi-hieratic character. From this follows the partition of the Vedic literature into two main subdivisions, on the one hand the *trayī vidyā*, the "three-fold knowledge" of the hymns of praise, the Rig Veda, of the chanted songs, the Sāma Veda, and of the sacrificial verses and formulæ, the Yajur Veda, with their Soma sacrifices, and on the other, the Atharva Veda, and the house ceremonies.

The performance of the great *ṛgveda* sacrifices required the participation of three classes of priests, the Hotar, or the reciting priest, the Udgātar, or the chanter, and the Adhvaryu, to whose lot fell the performance of the manual labor of the ceremonies. To this corresponds the tripartite division of the hieratic literature for the Veda of the Hotar is the Rig, that of the Udgātar is the Sāma, and that of the Adhvaryu, the Yajur Veda. In each Veda three main classes of works exist, the Samhitās, Brāhmaṇas, and Sūtras; and within each Veda these types follow one another in this order, for the Brāhmaṇas presuppose the Samhitās, and the Sūtras the Brāhmaṇas. But it does not follow from this that the composition of all the works of one type belongs to the same period. So that it is misleading to speak of a Brāhmaṇa or

Sūtra period and attempt to define them as if there had ever been a period in which, for example, the Brāhmaṇas and nothing else were composed. Besides there existed in each Veda different schools (*śākhās*), varying more or less from one another. Sometimes the difference consisted only in details of the ritual, sometimes in the theological exposition of its meaning, sometimes it extended to the Samhitās themselves. In the latter case the result is various recensions of the same Samhitā known as *śākhās* ("branches"). In the former cases the differences lead to the composition of different Brāhmaṇas and Sūtras belonging to the same Veda.

The Samhitās (from *sam*, a preposition comparable in meaning with *σύν* and *√dhā*, "to put," which appears also in *τίθημι*) are collections made from this floating mass of lyric material and sacrificial formulæ. To them the term Veda is frequently applied in a narrower sense, so that, for example, Rig Veda may mean either the Rig Veda Samhitā, or that Samhitā together with all the works of other classes dependent upon it.

The Rig Veda (from *ṛc*, a laudatory stanza, especially one that is to be recited in opposition to one that is to be sung) is the oldest and most important of these collections. It contains a little over 1,000 hymns, that consist of about 10,000 stanzas, and so are in bulk a little less than the Iliad and the Odyssey together. The hymns are religious lyrics of evidently very diverse origin and of correspondingly unequal literary merit. The mass of them, however, are directed alike to the greater gods of the Vedic pantheon, extolling their deeds, imploring them to come to the sacrifice, accept the offerings and grant blessings to their worshippers. It is from this material that the Hotar forms the Canon of the hymns that are required at each *ṛgveda* sacrifice. But as the order of the hymns does not follow the order of their employment in the ritual, and as the collection contains also material—for example, the funeral and wedding stanzas—not intended for this purpose, it becomes evident that the primary purpose of the collection was not to furnish a manual for the Hotar. It has, therefore, been assumed that the purpose of the collection was historic and scientific—to preserve a body of poetry the value of which was appreciated—and some of the hymns have been interpreted as secular poetry. Later investigations, however, go to show that these hymns also are religious, and that the Rig Veda itself is a collection of mantras intended for a ritual different from the system afterward expounded in the Brāhmaṇas and Sūtras.

The hymns are distributed into ten books, but the different principles of arrangement observable in them show that the collection is the expansion of a still earlier collection. With regard to its tradition,—the text of the hymns had evidently suffered a number of corruptions before they were brought together in the present collection. The formation of the latter antedated not only the composition of the Brāhmaṇas, but also the formation of the other Samhitās—the time of the redaction of these Samhitās must, however, be carefully distinguished from the time of composition of the material contained in them. From this time on the utmost care was bestowed upon the preservation of the text, and

these efforts attained upon the whole a wonderful success. An exception is to be made for the work of certain scholarly redactors—the close of whose activity falls between the composition of the Brāhmaṇas and the time of Pāṇini, who modernized the text to a certain extent chiefly by forcing upon it the observance of the later laws of *samdhī*,—the rules that govern the contact of words in a sentence. From their hands issued the Saṁhitā text. For its protection was composed the Pada-pāṭha, or “word text,” which attempted to undo the effects of the laws of *samdhī* and give each word in its original form. Still more elaborate precautions of a similar nature were the Krama-pāṭha, or “step text,” the Jātā-pāṭha, or “woven text,” and the Ghana-pāṭha. Further safeguards were certain phonetic treatises, the Prātiçākhyas, to be mentioned below. The result has been that we have the Saṁhitā text, as it came from the hands of its redactors, and as the changes made by them can generally be detected by disturbances of the metre, we can restore the collection to essentially the form in which it previously existed. Of different *çākhās* of the Rig Veda only one has been preserved, that of the *Çakalas*.

The Sāma Veda (from *sāman*, a chant) is a collection of the words to be used by the Udgātā at the *soma* sacrifice. It contains 1,549 stanzas, all except 75 of which occur also in the Rig Veda. Historically therefore it is the least important of the Saṁhitās. In accordance with the purpose of the Sāma Veda they stand not in their original context but in the order of their liturgical employment. The Saṁhitā exhibits these verses simply in the form of the stanzas (*ṛças*) that form the basis of the melodies. They acquire their proper character of Sāmans only in the Gānas or song books, where the prolongations, repetitions, and additional syllables required by the music are noted. As each stanza could be chanted in a great variety of ways, the number of Sāmans is practically unlimited. The text has come down to us in the recensions of two schools, namely, the Rañāyanīyas and the Kāuthumas, while of the song books four are known, namely, the Grāmageyāṇa, the Āranyagāṇa, the Uḡagāṇa, and the Ūhyagāṇa.

The Yajur Veda (from *yajus*, a liturgical formula) is, as its name denotes, a collection of the sacrificial hymns and formulæ and primarily those of the Adhvaryu. Like the Sāma Veda, it follows in its arrangement the order of the ritual, but it is broader in the scope of its material, for the Sāma Veda is limited to the treatment of the *soma* sacrifice, while the Yajur extends to the other *çrāuta* sacrifices also. It is the Veda in which the school differences are most noticeable. The two great divisions are the White and the Black Yajur Vedas. The difference being that the Saṁhitā of the former is merely a collection of *mantra* material, while the Saṁhitā of the latter contains not only this material which properly belongs in a Saṁhitā, but also a certain amount of theological exposition which should properly be in the Brāhmaṇa. Of the White Yajur Veda we have two recensions, those of the Mādhyamīnas and the Kāṇvas. The Black Yajur Veda exists in the following recensions: the Tāittirīya Saṁhitā, the Maitrāyaṇī Saṁhitā, the Kāthaka Saṁhitā, and the Kanīsthala-Katha Saṁhitā.

The Brāhmaṇas (relating to *brahman*, “religious formula”) are theological treatises concerned chiefly with the ritual of the sacrifice. They do not systematically describe the ritual, for they presuppose a knowledge of it, and also a knowledge of the *mantra* material of the Saṁhitā. Their object is to explain the mutual relationship of these two elements—rite and formula. This involves exegesis of the *mantras* and leads to the telling of many myths. Furthermore, as they are concerned not only with the external relationship of the ceremony to its formulæ but much more with its internal relationship (for to the Hindu what a thing is, is never of as great importance as what the thing symbolizes), they contain masses of theological and philosophical speculations frequently of the most fantastic mysticism. In form they are throughout in prose, except for certain peculiar parts imbedded in them called the Gāthās. Appended to them are certain works of a theosophical character—called the Āranyakas or Forest Books, because owing to their peculiar mystic sanctity they could safely be transmitted from teacher to pupil only in the seclusion of the forest. The Upaniṣads (“confidential sessions”) are esoteric philosophical speculations concerning chiefly the nature of Ātman or Brahmā, the world-soul. They are also called the Vedānta, that is, “end of the Veda,” either because of their position or as their adherents insist in the sense of the “final goal of the Veda.” Now each of these Brāhmaṇas attaches itself to one of the Saṁhitās and accordingly treats only of the portion of the ritual in which the corresponding priest is engaged. According to this principle they are classified: (1) Belonging to the Rig Veda; the Āitareya Brāhmaṇa and the Kāṣitaki or Çāṅkhāyana Brāhmaṇa to each of which is attached an Āranyaka and an Upaniṣad of the same name. (2) Brāhmaṇas belonging to the Sāma Veda. Of these we have the Pañcaviṇṣa Brāhmaṇa, so called from its consisting of 25 books with its supplement, the Ṣaḍviṇṣa Brāhmaṇa; the Chāndogya Brāhmaṇa with its Upaniṣad, and the Jāiminiya Brāhmaṇa containing the Kena Upaniṣad. Four other works belonging to this school, the Sama-Vidhāna, Brāhmaṇa, the Devatādhyāya Brāhmaṇa, the Vaṇça Brāhmaṇa, and the Saṁhitopaniṣad are Brāhmaṇas only in name. (3) For the White Yajur we have the Çatapatha Brāhmaṇa in two recensions, corresponding to the two recensions of the Saṁhitā. (4) For the Black Yajur Veda the Brāhmaṇa material is already imbedded in the Saṁhitā, but there also exist as independent works the Tāittirīya Brāhmaṇa, and Āranyaka, the latter containing two Upaniṣads in addition to which there are the Kāthaka and the Maitrāyaṇa Upaniṣads.

The Sūtras (“threads” or “clues”) are compendiums of practical rules for various subjects. Stylistically works of this class are characterized by the utmost endeavors for conciseness. The extent to which these efforts were carried is shown by the aphorism that an author should rejoice more over the saving of half a long vowel than over the birth of a son—on which depended his happiness in the next world. The name is frequently applied in a narrower sense to the Sūtras that treat of religion, the so-called Kalpa Sūtras. The greater part of these Sūtras fall into two classes, the Çrāuta (relating

to *gruti*, revelation) Sūtras which deal with the elaborate ceremonies for the performance of which three fires are required and the services of a number of priests; and the Grhya (from *grha*, "house") Sūtras which deal with the simpler observances of daily life that are performed by the householder himself in the house fire. Each Sūtra attaches itself to a particular Samhitā. In the case of the Ṛāta Sūtras this connection is evidenced by their limiting themselves to the duties of the corresponding priest so that a complete picture of the sacrifice can be gained only by the combination of several Sūtras; for the Grhya Sūtras the connection is not so close. All treat of essentially the same subjects, but each draws its mantra material as far as possible from its own Samhitā. The following Sūtras have been preserved: for the Rig Veda, the Čākhāyana, Ṛāta Sūtra, and the Āçvalāyana Ṛāta Sūtra, and two Grhya Sūtras of the same name; for the Sāma Veda, the Ṛāta Sūtras of Māçaka, Lātyāyana and Drāhyāyana, and the Grhya Sūtras of Gobhila and Drāhyāyana; for the White Yajur Veda the Ṛāta Sūtra of Kātyāyana, and the Grhya Sūtra of Pāraskara; for the Black Yajur Veda the Ṛāta Sūtras of Āpastamba, Hiranyakeçin, Bāudhāyana and Bhāradvāja, also the Mānava and the Vāikhānasa Ṛāta Sūtras. To each of these is a corresponding Grhya Sūtra and also the Kāthaka Grhya Sūtra.

This summary of the hieratic literature has included in the Grhya Sūtras one side of the popular religion. In them, however, we have the popular ceremonies as developed, systematized, and codified by the Brahmans. Moreover, they represent the Hindu only in the natural course of his life and in his orderly and lawful desires. Fortunately the picture is completed by the Atharva Veda; so that we have a knowledge of the private life of the Hindu with a fulness of detail that is not equaled by the records of any people of a similarly remote period.

Of the Atharva Veda Samhitā two *çākhās* exist: one of these, the Pāippalāda, has been preserved only in a single manuscript and has only recently become generally accessible; the other that of the Čāunaka school has been carefully edited and extensively studied. It consists of a little over 700 hymns of about 6,000 stanzas divided into 20 books. Of these the last two are later additions, one being taken chiefly from the Pāippalāda Čākhā, the other from the Rig Veda. Books 13-18 are devoted to special subjects; the other books contain charms for the cure of various diseases frequently regarded as possession by demons; prayers for long life and health; imprecations against demons, sorcerers, and enemies; charms pertaining to women; charms to secure harmony and influence in the assembly; charms pertaining to royalty; prayers and imprecations in the interest of the Brahmans; charms to secure prosperity; charms in expiation of sin and defilement; cosmogonic and theosophic hymns and ritualistic hymns. In short the Atharva touches the interests of every class of life and ranges from the highest metaphysics of theosophic mysticism to the lowest bathos of sorcery. The redaction of this material is later than the redactions of the other Samhitās and probably later than the composition of some of the Brāhmaṇas. The material itself is of widely

different ages; some of it cannot be much older than the time of the redaction; other parts may be among the earliest products of Vedic literary activity as some of the practices go back even to Indo-European times.

The subordinate literature of the Atharva was evolved in an order diametrically opposite to that of the other Vedas. The oldest work is the Kāuçika Sūtra, which gives the ritual for the employment of these hymns and has its closest analogies in the Grhya Sūtras. Later the Atharvans advanced the claim that their Veda was the fourth Veda, the Sarvā Vidyā or "complete knowledge" that always loomed up behind the consciousness that each of the other Vedas was only the fraction of a greater unit; that this was the Veda of the fourth priest, the Brahman, who exercised a general supervision of the sacrifice, and consequently that this important office could be filled only by an Atharvan; finally that the Purohita or house chaplain of the king must be a member of their school. To support these claims were needed works treating of the duties of the Brahman such as existed for the other priests in the other Vedas. Accordingly there were composed the Vāitāna Sūtra (a Ṛāta Sūtra) and the Gopatha Brāhmaṇa. Furthermore a large number of Upaniṣads came to be attached to the Atharva.

A complete Kalpa Sūtra contains also a Dharma Sūtra, or a collection of aphorisms on the law, chiefly from its religious side. Those of Āpastamba, Hiranyakeçin and Bāudhāyana—all belonging to the Tāitirīya division of the Black Yajur Veda—have been preserved; the Dharma Čāstras of Gāutama (Sāma Veda) and Vasiṣṭha (Rig Veda) are in reality also Dharma Sūtras. Kalpa, however, is only one of the six Vedāṅgas or "limbs of the Veda" into which tradition divides the whole Sūtra literature. The others are *çikṣā*, "pronunciation"; *chandas*, "metre"; *vyākaraṇa*, "grammar"; *nirukta*, "etymology," and *jyotiṣa*, "astronomy." The beginnings of these sciences generally go back to the Brāhmaṇas; in the Sūtras they are elaborated and then flourish in the post-Vedic period. Of special works are to be mentioned the Prāticākyas "relating to the Čākhā," or phonetic treatises, whose object is to explain the relationship of the Samhitā and Pada-pāṭha texts. For grammar the great work is that of Pāṇini, which as the norm of the classic language requires fuller treatment under that head. Etymology is represented by Yaska's Nirukta. The Sūtras are completed by the Paricīṣṭas or Supplements. Finally there are the Prayogas, "manuals," and Paddhatis, "guides," that give a more connected picture of the sacrifice and indices called Anukramiṇīs that treat the literature from various points of view.

Bibliography.—The best work of reference on all subjects connected with India is still in course of publication: 'Die Grundrisse der Indo-Arischen Philologie und Altertumskunde, begründet von Georg Bühler, fortgesetzt von F. Kielhorn' (Strasburg 1896). It contains the fullest citation of the literature of the subject. Many of the texts have been translated into English in 'The Sacred Books of the East,' edited by Max Müller, Oxford. In English there are: The translation of Weber, 'History of Indian Literature' (3d ed., London 1892), and of Kaegi, 'The Rig Veda' (Boston 1886); also 'A History of Sanskrit Literature,' by A.

VEEN — VEGETABLE KINGDOM

A. Macdonell (New York 1900), all of which give besides a treatment of the subject a fuller bibliography. **GEORGE MELVILLE BOLLING**, *Professor of Greek, Catholic University, Washington, D. C.*

Veen, vān, Otto van (called "OTTO VENIUS"), Dutch painter: b. Leyden 1558; d. 1629. His father was burgomaster of Leyden in 1572, and remaining faithful to Philip II., his property was confiscated and he was driven to Liège with his son Otto who there began the study of painting under Lampronius. In 1575 he became a pupil of Federigo Zuccherò (q.v.) in Italy. He appears in Liège as page to Ernest de Bavière in 1580, and is sent on a diplomatic mission to the emperor. At Antwerp Rubens became his pupil in 1592 and he was made dean of the Guild of Saint Luke in 1602. He was a fine poet as well as a brilliant painter. His historical pictures and portraits are marked by strictness of design, natural attitudes, and the most expressive faces, while the coloring is brilliant, though never attaining to the gorgeous and transparent lustre of his pupil Rubens.

Veer'y, or Tawny Thrush, a small migratory thrush (*Turdus fuscescens*) of eastern North America. The veery ranges from the Rocky Mountains eastward, chiefly within the United States and nests throughout the northern part of its range. It is uniform cinnamon brown above and with very little spotting or marking underneath. The usual call note is a very clear whistle, *wheden*, easy to imitate. The song is much less frequently heard, but is very attractive, though so peculiar as to be quite characteristic. The nest is built on or near the ground, chiefly of bark, rootlets and leaves, and the four or five eggs are bright greenish-blue, unspotted. The veery is decidedly a woodland bird, preferring damp woods with considerable underbrush.

Vega, vā'gā, Garcilaso. See GARCILASO DE LA VEGA.

Vega Carpio, vā'gā kār'pē-ō, Felix Lope de, Spanish poet and dramatist: b. Madrid 25 Nov. 1562; d. there 26 Aug. 1635. After studying at Alcalá he joined the army, and in 1588 accompanied the Invincible Armada. About 1612 he became a priest, and subsequently Pope Urban VIII. made him a Knight of Malta and a doctor of theology. The most brilliant part of his literary career was still to follow. He had already written and published various poems, but his productions were now multiplied with extraordinary rapidity. Scarcely a year passed in which he did not print a poem, and in general scarcely a month, or indeed scarcely a week, passed in which he did not produce a piece for the theatre. He himself informs us that he had more than a hundred times composed a piece and brought it on the stage within 24 hours. Such pieces must, of course, have been very short. The fame that he enjoyed during his lifetime was immense. The people idolized him, and he received marks of distinction from the king of Spain and Pope Urban VIII. The latter, in return for the dedication of a tragedy on Mary Stuart, conferred on him the title of Doctor of Theology, and sent him the cross of the order of Malta. The profits that accrued from his works corresponded to his fame. His career thus contrasts strikingly with that of his contemporary Cervantes, who died (1616) in neglect

and poverty in the very city in which Vega was then living in luxury and splendor, and whose fame has spread over the world, while that of Lope has greatly declined even in his own country. In his later years Vega became ascetic in his way of living. About 450 of his dramatic productions have been printed. They reveal an inexhaustible but ill-regulated imagination, a strange mixture of the beautiful and the ridiculous, the sublime and the trivial, a rare mastery of dialogue, and extraordinary facility in versification. He has been described, probably with more epigrammatic force than strict accuracy, as the dramatist who has written the greatest number of good scenes, and the greatest number of bad pieces. The Spanish Academy began a collection of his works in 1893. Consult: Lord Holland, 'Some Account of the Life and Writings of Lope Felix de Vega Carpio' (1806-17); Ticknor, 'History of Spanish Literature,' Vol. II. (1849; 6th Am. ed. 1888); Lewes, 'The Spanish Drama: Lope de Vega and Calderon' (1846); Forster, 'Some French and Spanish Men of Letters' (1891); Farinelli, 'Grillparzer and Lope de Vega' (1894); Ludwig, 'Lope de Vega's Dramen aus dem Karolingischen Sagenkreise' (1898); Wurzbach, 'Lope de Vega' (1898).

Vegetable Fibre. See FIBRE.

Vegetable Ivory, a hard, fine-grained, white substance which is the reserve cellulose stored in the cell-walls of the endosperm of the fruits of *Phytalephas macrocarpa*, a Central American palm (q.v.). Its stem reclines upon the ground for a few feet, and then is crowned with long, linear, plume-like pinnate leaves, arching upward for 20 or 30 feet. Its fruits lie near the ground, are globular, about as large as a man's head, and consist of several drupes, enclosed in a woody, wart-covered wall. The kernels of the drupes, or seeds, are about the size of a hen's egg, and when very young contain a clear, insipid fluid, which is used instead of water by travelers. As in the cocoanut, this fluid becomes milky and sweet-flavored, and the nuts are eagerly eaten in this stage by sundry animals, but continue to thicken and harden, until, when fully ripe, the seeds are so very hard as to form a valuable substitute for elephant ivory. These seeds are known to commerce as ivory-, or carozonuts, and are extensively used in making small articles of turnery, as buttons, umbrella-handles, and the like.

Vegetable Kingdom. All the plants in the world considered in systematic order, especially with reference to their arrangement in branches, classes, orders, etc. On account of the vast numbers of known species of plants (nearly 200,000) it is necessary that they should be arranged in an orderly system, for in this way only can we readily refer to or remember them. Of course, there may be many useful systems of plants, that is, systematic arrangements of the thousands of species, and in fact many systems have been proposed from time to time by different botanists. More than 300 years ago, Cesalpino, in Italy, proposed a system in which the 15 classes which he recognized were separated primarily into "trees" and "herbs," and these were again distinguished by their fruits and seeds. A half century later Morison, in England, devised a system of 18 classes based upon characters of the

VEGETABLE KINGDOM

plant as a whole (trees, shrubs, herbs, etc.), the inflorescence, and the fruit. About 200 years ago Ray, in England, published his system of 23 classes, in which he still adhered to the time-honored primary division into "herbs" and "trees," the former of which he divided into the "imperfect" (seaweeds, fungi, mosses, ferns, etc.), and the "perfect" herbs. His "perfect" plants were divided into "dicotyledons" and "monocotyledons," as they are to this day, and several of his classes were practically identical with some of the families of the present time, as *Umbelliferae*, *Leguminosae*, grasses, etc. About the same time Bachmann, in Germany, proposed a system in which he rejected the common division into trees, shrubs, and herbs, and based his 18 classes upon the form of the flower; first, whether regular, irregular, or incomplete, and then, whether monopetalous, dipetalous, tripetalous, etc. At the same time Tournefort, in France, proposed still another system and based his 22 classes on characters derived from the corolla. However, he still adhered to the division into herbs and trees. Linne, in Sweden, a little more than 160 years ago gave the world his so-called sexual system, in which the number and relation of the stamens characterized the 24 classes, which were again divided into orders, mainly upon characters derived from the pistils. This system, while quite artificial, was very useful in enabling botanists to arrange their rapidly increasing knowledge of plants, and it was very generally used for a century.

We owe to Linne, also, the suggestion of a more natural system, which he published in fragmentary form contemporaneously with his sexual system. He recognized the greater groups Acotyledons, Monocotyledons, Dicotyledons, and Polycotyledons, and such smaller ones as the *Orchideae*, *Liliaceae*, *Gramina*, *Coniferae*, *Amentaceae*, *Compositi*, *Umbellatae*, *Bicornes*, *Pomaceae*, *Drupaceae*, *Caryophyllei*, *Asperifoliae*, *Stellatae*, *Papilionaceae*, *Siliquosae*, *Parsonatae*, *Filices*, *Musci*, *Algae*, *Fungi*, etc., which have since been incorporated into most natural systems under these or slightly different names. Half a century later this bore fruit in the system of Jussieu (in France) which divided the vegetable kingdom into Acotyledons, Monocotyledons, and Dicotyledons, and recognized 15 classes and 100 families. The dicotyledons were divided into *Apetalae*, *Monopetalae*, and *Polypetalae*, and the higher families were essentially identical with many of those now generally recognized. Thirty years later (1819) DeCandolle modified Jussieu's system, reversing the sequence so as to proceed from the higher to the lower, and dividing the petaliferous dicotyledons into the *Thalamiflorals*, *Calyciflorals*, and *Corolliflorals*. He recognized 161 families of plants of all kinds. About 40 years ago the Candolle system was further modified by Bentham and Hooker, and until recently this has been the commonly accepted system in English and American botanical text-books.

A little more than 20 years ago Eichler (in Germany) published his system, in which the vegetable kingdom was separated into five "divisions,"—*Thallophyta*, *Bryophyta*, *Pteridophyta*, *Gymnospermæ*, and *Angiospermæ*, and under these were about eight classes, and nearly 40 orders. This by modification has given rise to the system of Engler (in Germany) now in

common use in this country, which in its latest form recognizes 13 primary "divisions" of the vegetable kingdom, 36 classes, about 100 orders, and nearly 600 families.

The system outlined below, while conforming in general with that of Engler, differs from it in many details. It is an attempt to make the system conform to the author's conception of the course of evolution in the vegetable kingdom. The general relations of the classes to one another may be indicated by the following chart:

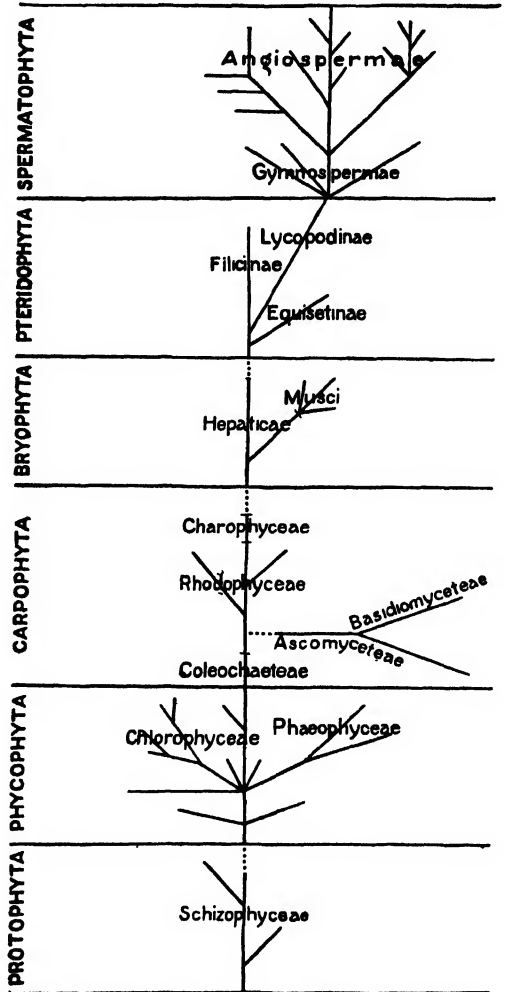

Chart showing the relationship of the branches and classes of the Vegetable Kingdom.

BRANCH I. PROTOPHYTA.—Water Slimes. — These are single-celled or few-celled, minute, aquatic plants which are typically of a blue-green or brown-green color. Their cells have no well defined nucleus, although nuclear matter is present in minute granules. They are propagated by fission and internal spores. These plants probably represent the primitive vegetation of the world. There is but one class.

Class 1. *Schizophyceae*.—The Fission Algae. This class includes about 1,000 species, in two orders.

VEGETABLE KINGDOM

Order 1. *Cystiphora*.—In this order the plants are strictly one-celled. (Fig. 1.) They constitute a single family of mostly blue-green plants. A few are hysterozytes (parasites or saprophytes) and as a consequence are colorless, and are called "bacteria."

Order 2. *Nematogencæ*.—Here the plants are in threads which are generally simple, a few only being branched. (Fig. 2.) While many have the typical blue- or brown-green color characteristic of the branch, there are many colorless species which constitute the greater number of the "bacteria." There are five families, including the blue-green slimes *Oscillaria*, *Nostoc*, *Rivularia*, etc.

BRANCH II. PHYCOPHYTA.—*Spore Alga*.—The plants of this branch range from minute single cells to branching threads, and large, massive stems with leaves above and roots below. They are typically aquatic and of a bright green color, but in many this is hidden by a brown-green pigment. Some of the species are colorless hysterozytes. The cells have well developed nuclei. They are propagated by fission and free-swimming zoospores. In this branch we find the simplest beginning of sexual reproduction, in which two zoospores fuse into a single rounded cell, which later gives rise to a new

trunks, etc., as a green layer resembling a coat of green paint. Another species is the so-called "Red Snow Plant" of high northern latitudes. It is a minute, spherical, green plant in which the green color is masked by a red coloring matter. It vegetates upon the melting snow.

There are about 335 species, which constitute five families, one of which (*Synchytriaceæ*) is composed of minute parasites in the cells of other plants.

Order 4. *Confervoideæ*. The *Confervas* (Fig. 4) are filamentous (rarely stratozose) plants, typically composed of distinct cells. In their reproduction one or both gametes are free-swimming zoospores, and they are also propagated non-sexually by zoospores. They are mostly bright-green alga floating in fresh ponds and running waters, or in brackish ponds, or the ocean itself. There are nine or ten families, one or two of which are parasitic or saprophytic.

Here are to be found the pretty plants known as Sea Lettuce, which grow in salt waters, and look quite like leaves of garden lettuce. Here, too, are the pretty *Confervas* which form delicate threads of green in fresh waters, and the coarser Water Flannels (*Cladophora*) of fresh and salt waters in which the cells are imperfectly separated, the threads being septated at considerable intervals. The highest members of the order are the pretty species of *Oedogonium* with their highly differentiated sexual reproductive apparatus. Near these are the *Monoblepharids* (*Monoblepharidaceæ*), a family of minute aquatic, colorless saprophytes.

Order 5. *Conjugatæ*.—The Pond Scums (Fig. 5) are typically filamentous unbranched plants, consisting of green cells arranged end to end in long threads. Through structural degeneration many of the filaments break up very early into separate cells, so that they have become almost or quite unicellular. They propagate asexually by fission alone, there being no zoospores known in the order. They reproduce (sexually) by the sluggish fusion of the protoplasm of two contiguous cells, the result being a thick-walled resting spore. There are three families, namely, the Pond Scums, proper, including *Spirogyra* with its filaments of beautiful spirally-banded cells; the *Desmids*, which are usually separated into single green cells of beautiful outline; and the *Diatoms* with silicious walls elegantly marked with beaded or punctured surfaces.

Order 6. *Siphonææ*.—The Tube Alga (Fig. 6) include plants which consist of non-septate, branched tubes. Each tube is really a thread of many cells, but the partitions between these have not been formed, so that the nuclei (which are minute and very numerous) are scattered throughout the length of the tubes. Now and then partitions are formed where particular portions of the plant are to be set off from the main body, as in case of the reproductive organs. They are propagated asexually by zoospores, and even in the hysterozytic species, which have become aerial (non-aquatic) zoospores are still commonly produced. Sexual reproduction is accomplished by free-swimming, equal gametes, or in the higher forms by antherozoids and non-motile eggs.

Many of the species are marine, and some of these attain a large size. Among them are the curious sea bottles (*Valonia*) an inch or two

 FIG. 4.—A young filament of *Uronema*; much magnified.
 FIG. 5.—Parts of two filaments of *Spirogyra* just before the fusion of the protoplasm of contiguous cells; much magnified.
 FIG. 6.—Part of plant of *Vaucheria*, showing root below and green filament above, with antherid and two egg cells; much magnified.
 FIG. 7.—A whole plant of *Dictyonema*; much reduced.

plant. In the higher members of the branch the uniting zoospores have become unlike, one (antherozoid) being smaller and motile, the other (egg) being larger and not motile. There are two classes.

Class 2. *Chlorophyceæ*.—The Green Alga are composed of one-celled or filamentous plants, rarely a flat plate of cells, and are typically bright green. To a very large extent these are the fresh-water alga of our streams and pools. There are four orders, including nearly 9,000 species.

Order 3. *Protococcoidæ*.—The Green Slimes are minute, one-celled, bright green plants growing in the water or in moist places (Fig. 3.) One species is common on damp walls, tree

VEGETABLE KINGDOM

in diameter, sometimes growing in branching masses, the Caulerpas a foot or two long with leaf-like and usually lobed segments attached to a horizontal running stem, and the pretty mermaid's wine-glasses (*Acetabulum*) of the warmer seas. The latter are delicate stems each bearing a terminal whorl of united upturned, spore-bearing segments. Among the freshwater plants are species of *Vaucheria* and *Botrydium*; the former consisting of coarse, long, green, branching tubes, which grow in the water or on wet ground; the latter of minute, ovoid, green bladders attached to the wet ground by colorless roots.

There are many hysterophytic species, some of which are minute parasites in lower plants and animals, while others are larger, and infest the bodies of higher aquatic or terrestrial plants and animals, while still others are saprophytic on animal or vegetable matter on land.

There are nine families of green plants of this order, and seven of hysterophytes, including altogether about 750 species, nearly two thirds of which belong to the hysterophytic families.

Class 3. *Phaeophyceæ*.—The Brown Algæ are composed of filamentous or more commonly massive plants, the latter of considerable dimensions, and have developed stems, roots, and leaves. They are usually of a brownish-green color, due to the presence of a brown pigment which hides the chlorophyll. They live almost exclusively in the sea, and none are hystero-phytes. There are about 1,050 species, which are divided into three orders.

Order 7. *Phaeosporææ*.—The Kelps (Fig. 7) range from small filamentous branching plants resembling the Confervas, to enormous plants hundreds of feet in length, with stems, roots and leaves. They are propagated by motile, non-sexual zoospores, and in some cases by the union of two equal (or unequal) free-swimming gametes. The zoosporangia are often collected in patches on the surface of the plant, as in the figure (Fig. 7). These plants are not yet thoroughly understood, and as a consequence their classification is quite unsettled. Some authorities divide them into no less than 25 families, while others recognize but four families.

Among the common plants of the order are the Devil's Aprons (*Laminaria*) which consist of a stout stem, with roots below, and terminating above in a broad, leathery leaf, the whole often being from one to several yards in length, and a foot or more in breadth. The Giant Kelp (*Macrocystis*) of the Pacific Ocean is no doubt the longest plant in the world, sometimes attaining the enormous length of seven hundred feet. It consists of a long, tough, round stalk an inch or more in diameter and many feet in length, with large branching roots below, and bearing many narrow leaves, two to four feet long, each having a large air-vessel (an inch in diameter, and four or five inches long) in its petiole. By means of these air-vessels the leafy part of the plant floats at the surface of the water. Nor are the Sea Trees (*Lessonia*), also of the Pacific Ocean, any less interesting. They consist of erect stems, rooted below and branched above, the latter bearing many pendent, narrow leaves. Some of these veritable trees are several yards in height. The pretty Mermaid's Strings (*Chorda*) are flexible, string-like stems, a yard or so long, rooted below, and smooth or

delicately fringed above. They occur in the Atlantic and the Pacific oceans. *Dictyonereon* (Fig. 7) of the Pacific coast of North America is a foot or two long.

Order 8. *Dictyotea*.—The Sea Fans (Fig. 8) are usually erect, medium-sized pretty plants, often fan-shaped, or more or less divided, rooted below, and growing terminally. They do not produce motile zoospores, but on the contrary their spores are motionless, and are often produced in fours (tetrads) which fact has suggested a relationship with the Red Seaweeds. Likewise the gametes in sexual reproduction are motionless, again remind us of the Red Seaweeds.

There is but one family, including 130 species, mostly occurring in the warmer seas. The principal genus is *Dictyota*, with from 30 to 50 species.

Order 9. *Fucaceæ*.—The Rockweeds (Fig. 9) are branching medium-sized plants, growing at or near the surface of the water, often attached to rocks between low and high water marks. They are firmly rooted below and in some cases the plant body is differentiated into stems and leaves. In these plants the sexual reproduction has been made so perfect that it appears to have entirely supplanted the asexual process, no zoospores whatever being formed. Antherids and eggs are formed within cavities in the swollen

FIG. 8.—A plant of *Dictyota*; somewhat reduced.

FIG. 9.—Portion of a plant of *Sargassum*; much reduced.

FIG. 10.—A plant of *Coleochaete*; much magnified.

ends of the branches, and from the fertilization of the eggs by the motile antherozoids rounded cells (zygotes) are formed which grow at once into new plants.

There are 450 species, all of which are usually regarded as belonging to a single family, although by some authors they are distributed among four families.

The largest genus is *Sargassum*, with about 200 species, one of which (*S. bacciferum*) is the "Gulf-weed," which floats in great quantities in the so-called "Sargasso Sea" in the mid-Atlantic Ocean. Originally attached by roots, it has broken loose and been carried away by the Gulf Stream and other ocean currents. It is suspended in the water by many little air-bladders which occur on its petioles. Other common plants are the Rockweeds, proper (*Fucus*), which are attached to rocks and wharves between high and low tide marks, and the Knotty Rockweed (*Ascophyllum*) with large air-bladders in its slender stems.

BRANCH III. CARPOPHYTA.—*Fruit Alga*.—In this branch the plant body is for the most part more highly organized. The simplest plants are microscopic, branching threads, attached at one end and growing at the other.

VEGETABLE KINGDOM

From such simple forms we pass to branched massive plants a foot or more in height. The typical plants are aquatic, green and chlorophyll-bearing, but in a considerable number of these there is a red or purple pigment which hides the green color. From these aquatic forms there have sprung a vast number of colorless hystero-phytes, which constitute the great body of the "fungi." (See article FUNGI.)

In the aquatic forms are found zoospores which take part in asexual reproduction, but these give place to walled cells (spores) in all of the hystero-phytes. In their sexual reproduction the aquatic forms develop antherozoids and eggs, and after fertilization of the latter, simple "fruits" are formed as a result of the stimulation of adjacent cells into the growth of protective tissue. In the hystero-phytes the antheridial protoplasm passes directly from the antherid to the egg cell, and the fruit is often quite complex in its structure.

There are five classes, three of which are composed of holophytes, and two of hystero-phytes.

Class 4. *Coleochaete*.—The Scale Algae are minute green disks or clusters of radiating filaments which grow on the surfaces of larger aquatic plants. Many of the cells are armed with long bristles. These algae are propagated non-sexually by zoospores, and sexually by the

rophyll-bearing, but the green color is hidden by a red or purple pigment. In their reproduction they form asexual, four-celled bodies (tetraspores) which break off and float away, where they grow directly into new plants. Their sexual organs consist of simple antherids which give rise to naked (non-ciliated) antherozoids, and usually flask-shaped carpogones, each containing an egg in the lower, enlarged portion, from which rises a slender trichogyne. The antheridial protoplasm is conveyed by the trichogyne to the egg, after which the latter divides and gives rise to branches bearing rows of spores, the whole usually enclosed in a pericarp of protective tissue. On germination these spores produce new plants similar to those from which they were derived.

There are about 2,700 species, divided very unequally between two orders.

Order 11. *Bangiales* (Fig. 11) are the lowest of the Red Seaweeds, having simple filamentous stems, or a thin transparent plate of cells. Their tetraspores are motile. Their antherozoids attach themselves to the simple carpogones, which are scarcely distinguishable from the vegetative cells. *Bangia*, with 12 species of filamentous plants, and *Porphyra*, "Laver," of 16 species, are the principal genera. The last named are flat leaf-like purple plants, which are very common throughout the world, and are used for human food. *Thorea* is a fresh-water species, occurring in streams in North America and Europe.

Order 12. *Florideae* (Fig. 12) include the great mass of the Red Seaweeds. They range from minute filamentous plants to massive ones of considerable size. Their tetraspores are not motile, and their carpogones are always clearly set off from the vegetative cells. Here are found nearly all of the *Rhodophyceae*.

Among the numerous genera (representing about 20 families) the following are especially noteworthy: *Batrachospermum*, delicate, purple plants occurring in fresh waters; *Chondrus* (Fig. 12), branching, purple plants a few inches high, one species of which is the well-known Irish Moss used for making blanc mange; *Plocamium*, a few inches high and regularly divided into minute branchlets; *Polysiphonia* and *Ceramium*, with many delicately branched species; *Grinnellia*, in which the plant consists of a beautiful scarlet ribbon attached below by roots; *Dasya*, with its thread-like stem covered with myriads of red-purple filaments; *Corallina*, in which the whole plant is covered with a thick incrustation of lime.

Class 6. *Ascomyceteae*.—The Sac Fungi are filamentous hystero-phytes allied to the Scale Algae and Red Algae. Since they do not produce chlorophyll the vegetative portion of the plant body is poorly developed, while there is a corresponding increase in the reproductive apparatus. Usually, there are two kinds of spores produced, namely, those formed by the breaking off of cells (conidia, or summer spores) from the ends of specialized branches, and those contained in special terminal cells in the "fruits" which are characteristic of the Branch. These terminal cells are the spore-sacs (*asci*, sing. *ascus*) which are characteristic of the class. The spores are known as ascospores, and on germination they produce plants similar to those upon which they were borne.

FIG. 11.—Portion of a plant of *Thorea*; somewhat reduced.

FIG. 12.—A plant of *Chondrus*; somewhat reduced.

FIG. 13.—A fruit of *Microsiphara* with its branched appendages; much magnified.

FIG. 14.—A fruit of *Laver*; somewhat reduced.

fertilization of the egg by means of motile antherozoids. The fertilized egg soon becomes covered with a layer of cells which grow from below the base of the oogone, and the zygote remains one-celled until its germination (in the spring), when it divides into several cells, each of which gives rise to a zoospore. From these zoospores new plants are eventually produced.

There are but few species (10 to 12), and all are included in a single order.

Order 10. *Coleochaetaceae* (Fig. 10).—With the characters of the class. There is but one family composed of two genera. *Coleochaete*, the typical genus, is represented by several species, which are very common in fresh-water ponds.

Class 5. *Rhodophyceae*.—The Red Seaweeds are minute to medium sized, or even large plants (a foot or more in length) rooted below, and more or less branched above. Their stems are simple or few-celled in the lower forms, but large and massive in the higher. Leaves are differentiated in some cases. All are chlo-

VEGETABLE KINGDOM

The sexual organs have been observed in but few of the species, but where seen they appear to be of the type of those of the Scale Algæ and the Red Algæ. A globose carpogone, with or without a trichogyne, is fertilized by the direct application of the antherid, and the transfer of antheridial protoplasm to the egg. After fertilization the egg divides and sends out branches whose terminal cells become the spore-sacs (asci) spoken of above. At the same time through the stimulation of cells adjacent to the carpogone, sterile branches are produced which form a pericarp, or other protective tissue.

The Sac Fungi constitute an enormous assemblage of hysterophytes (30,000 to 50,000 or more), ranging from microscopic forms to those a foot or more in extent. These may be arranged under six orders, with three provisional orders for the forms so imperfectly known as not to be included elsewhere.

Order 13. *Perisporiaceæ*.—The Simple Sac Fungi (Fig. 13) are small, branching filamentous plants, which produce minute, spherical, closed fruits, containing from one to many spore-sacs. The shell (perithecium) of the fruit is usually hard and composed of one or a few layers of cells. The sexual spores (conidia) are formed by the abstriction of cells from the summits of erect branches. The sexual process has been studied very fully in some species of this order. The carpogone is without a trichogyne, and the antherid is applied to its summit and the antheridial protoplasm transferred directly to the egg. The result of this process is the production of one or more spore-sacs, and the upgrowth of the pericarp tissue around the asci.

The most important plants belonging to this order are the Powdery Mildews, which constitute the family *Erysiphaceæ*. Common genera are *Erysiphe*, *Sphærotheca*, *Microsphaera*, *Uncinula*, etc., whose species are parasites on the leaves of higher plants.

Order 14. *Tuberoideæ*.—The Truffles (Fig. 14) are allied to the Simple Sac Fungi, from which they are separated by their subterranean spore-fruits, which are compound (instead of simple), and from the size of a pea to that of a hen's egg. Little is known of their round of life, but it is thought that the large spore-fruits result from a fertilization similar to that in the preceding order. Conidia are known for some species.

The typical genus is *Tuber*, several species of which are the edible truffles of the European markets. None of the American species (which are by no means common) have yet been used for food.

Order 15. *Pyrenomycetæ*.—The Black Fungi (Fig. 15) include a great number of mostly small fungi. The filamentous plant body is often inconspicuous, ramifying the tissues of the host or the substratum, and upon it there develop the usually hard and black fruits. The latter are often small and simple, but in other cases they may be aggregated into a compound fruit-mass. In many species the simple or compound fruits form beneath the surface of the host or substratum and burst through as they reach maturity. The individual fruits consist of a cellular perithecium, enclosing many spore sacs, and usually paraphyses, also. There is frequently an opening at the summit of the perithecium for the escape of the spores. While sexual organs

probably precede the formation of the fruits they have not yet certainly been observed in any species of this order.

Many injurious fungi are found here. Species of *Nectria* often produce "canker" of the bark of trees of various kinds, as maples, elms, locust, apple, etc. Their fruits are small, spherical and of a yellowish or reddish color, and are frequently clustered in the ruptured patches on the bark. Ergot, which is common on heads of rye and some wild grasses, is a poisonous species of the genus *Claviceps*. A species of the genus *Rhizoctonia* produces a root and stem rot in the sugar beet. The strawberry "leaf-spot" is produced by a species of *Sphærella*. The "black rot," one of the most destructive diseases of the grape, is the result of the presence of a species of *Lasdadia*. A species of *Venturia* (formerly known as *Fusicladium*) is the cause of "apple scab." The "black knot" of the plum and cherry is caused by a species of *Plowrightia*, in which the perithecia are aggregated into a compound fruit mass. Among other genera are *Hystero-graphium* (Fig. 15), common on the bark of ash and oak trees. Some genera are lichen forming, as *Graphis*, *Verrucaria*, etc.

FIG. 15.—A dead stick with black fruits of *Hystero-graphium*; slightly reduced.
FIG. 16.—Several fruits of *Peziza*; slightly reduced.
FIG. 17.—Part of a grass leaf with a Rust (*Puccinia*) upon it; slightly reduced.
FIG. 18.—Head of wheat affected with a Smut (*Ustilago*); somewhat reduced.
FIG. 19.—A vertical section through the fruit of *Phyllosticta*; much magnified.

There are eight or ten families, and probably from 10,000 to 15,000 species.

Order 16. *Discomycetæ*.—The Cup Fungi (Fig. 16) are for the most part fleshy-fruited plants, in contrast with the preceding order in which the fruits are hard and dry. The plants themselves are filamentous, and are more often saprophytic, although many parasites occur. The fruits are typically opened out in the form of cups (apothecia), and in these the spore sacs and paraphyses are imbedded. In many cases the apothecia are closed when young so as to constitute perithecia, but as growth proceeds they usually open more or less. In some species of *Peziza* sexual organs have been observed.

Among the interesting plants of this order are the species of *Peziza*, some of which form pretty, orange or red cups from a quarter of an inch to an inch or more in diameter. They

VEGETABLE KINGDOM

occur on decaying logs, sticks, etc. The Morel (*Morchella*) is the stalked fruit of one of the Cup Fungi. The upper surface is covered with an irregular ascus-bearing layer, which is in fact an everted cup. Many species are lichen-forming, as in the genera *Parmelia* *Physcia*, *Usnea*, *Cladonia*, etc. See LICHENS.

There are a dozen or more families, and from 10,000 to 12,000 species.

Order 17. *Uredineæ*.—The Rusts (Fig. 17) are here regarded as degraded and much modified Sac Fungi. They are entirely parasitic plants, their filaments penetrating the tissues of their hosts, and coming to the surface only for the formation of their spores. On account of their extreme parasitism they are well supplied with reproductive processes, in typical cases having no less than four distinct kinds

FIG. 20.—A vertical section through the fruit of *Gloeosporium*; much magnified.

FIG. 21.—Several spore-bearing threads of *Ramularia*; much magnified.

FIG. 22.—A fruit of a Puff Ball (*Lycoperdon*); somewhat reduced.

of spores, namely,—cluster-cup spores (*æcidiospores*), red-rust spores (*uredospores*), black-rust spores (*teleutospores*), and germ spores (*sporidia*). The teleutospores are contained in tightly fitting asci, and there are one, two or several in each ascus. The *æcidiospores* and *uredospores* are conidial in nature, while the *sporidia* are found on the promycelium resulting from the germination of the teleutospores, and are probably to be regarded as conidial also.

Rusts are among the most destructive of parasites, especially those affecting the cereal crops. The typical genera are *Uromyces* (with one teleutospore in each ascus), *Puccinia* (with two-spored asci), and *Phragmidium* (with several-spored asci). The order contains but one family.

Order 18. *Ustilagineæ*.—The Smuts (Fig. 18) are still more parasitic than the Rusts, to which they are evidently rather closely related. They have suffered much degeneration, and their cells are soft and easily deliquescent. Their filaments penetrate the tissues and even the cell cavities of their hosts, and eventually give rise to spores which appear to be formed in degenerate spore-sacs. These generally appear in those parts of the host which are rich in food material, as the ovaries, young seeds, and the more succulent portions of the stems and leaves. Upon germinating the spores (*teleutospores*) give rise to a promycelium, upon which *sporidia* are produced, as in the Rusts.

There are two families, the principal genera in which are *Ustilago*, which includes the loose smut of wheat, oats, etc. (Fig. 18), and the smuts of Indian corn, and *Tilletia*, which contains the "hard smuts" of wheat and other grasses.

Order 19. *Sphaeropsidæ*.—The Spot Fungi (Fig. 19) constitute one of the three provisional orders made to include certain plants whose life history is so imperfectly known that we have called them the "Imperfect Fungi." All are filamentous fungi, and appear to be related to, if indeed they are not mere stages of the Sac Fungi. Those collected here have perithecium-like structures, but instead of containing asci, they contain threads which bear conidia. *Phyllosticta* and *Septoria* are common genera, whose species produce discolored spots on the leaves of many plants.

Order 20. *Melanconiceæ*.—The Black-dot Fungi (Fig. 20) include those "Imperfect Fungi" in which there is no perithecium, but whose spores (conidia) are produced beneath the epidermis, which they eventually rupture, setting the spores free, and forming dark colored or black dots. *Glæosporium* and *Melanconium* are common genera whose species occur on leaves, twigs and fruits.

Order 21. *Hyphomycetæ*.—The Molds (Fig. 21) include the remaining "Imperfect Fungi" in which the conidia are formed on threads which grow out through the stomata, or penetrate the outer decaying tissues. There are no perithecium-like structures, nor is there a rupturing of the epidermis. *Ramularia* and *Cercospora* are common genera, represented by many parasitic species, while *Monilia* and *Botrytis* are equally common saprophytes, with some species which may become parasitic also.

Class 7. *Basidiomycetæ*.—The Club Fungi are filamentous, chlorophyll-less plants, allied pretty closely to the Sac Fungi, from which

FIG. 23.—A fruit of a Toadstool (*Amanita*); somewhat reduced.

FIG. 24.—A plant of a Stonewort (*Chara*); considerably reduced.

FIG. 25.—A Liverwort (*Grimaldia*) of the thallose type; somewhat reduced.

they have probably arisen by a modification of their asci. While in the Sac Fungi there are certain end cells, the spore sacs (asci), which divide their protoplasm into *internal* spores, in the Club Fungi the similar end cells, the spore clubs (basidia), form their spores *externally* at the ends of short projections. The spore fruits in which the spore clubs (basidia) are developed are typically enclosed, and are made up of spore-bearing and protective tissues, as in case of the Sac Fungi. The spores (known as basidiospores) are set free by the earlier or later rupture of the fruit tissues. In no instance have the sexual organs of any of the Club Fungi been yet observed, although it is supposed that they precede the formation of the fruits.

VEGETABLE KINGDOM

The round of life of these plants is imperfectly understood, and we know little in regard to their conidia, which have been observed in but few of the species.

There are now known more than 10,000 species of Club Fungi, which are usually grouped under two orders.

Order 22. *Gasteromycetæ*.—The Puff Balls (Fig. 22) are Club Fungi which produce spheroidal fruits enclosing at maturity a mass of usually powdery spores. The plants, which are saprophytic, are masses of white filaments which ramify the decaying wood, or other organic matter, or even the soil where there is sufficient organic matter present. On these filaments small, rounded masses arise, and gradually grow to their full size, usually pushing through the substratum to the surface, where they appear as the familiar Puff Balls of the fields and woodlands, and which are in fact the fruits of these plants. The spore-bearing tissues deliquesce as soon as the spores mature, and then when the moisture evaporates the spores are left as a dry powder.

There are several families, the typical one including the common Puff Balls (of the genera *Lycoperdon*, *Calvatia*, *Bovista*, etc.), and the pretty Earth Stars (*Geaster*), in which the outer rind of the fruit splits stellately. The Bird-nest Fungi (constituting the family *Nidulariaceæ*) are in reality small, modified puff balls, and must be placed here. So, too, the evil-smelling Stink-horns (of the family *Phallaceæ*) are of the Puff Ball type, but considerably modified, so that after the rupture of the fruit walls a stalk carries up the mass of fetid spores. Some permanently subterranean species (of the family *Hymenogasteraceæ*) resemble the Truffles, externally and internally, and emphasize the relationship between the ascus-bearing and basidium-bearing fungi.

Order 23. *Hymenomycetæ*.—The Toadstools (Fig. 23) include some of the most striking of the fungi. In such a typical plant as the common Mushroom (*Agaricus*) of the markets, the plant consists of white filaments which ramify the decaying organic matter, and on these appear small rounded masses which grow larger and eventually break open by a circular rupture so as to form an umbrella-shaped structure, the fruit. On the under surface of the cap of the fruit are many radiating folds (gills) of spore-bearing tissue, and on these are exposed the spore clubs, each bearing two spores. In other toadstools the spore-bearing tissue is found lining the walls of pores, as in the Pore Fungi (*Polyporus* and *Boletus*), and in still other cases it is spread over the smooth surface of a flattened and indefinite fruit mass (*Corticium*) or a simple or branched club-shaped fruit (*Clavaria*).

There are eight to ten or more families of Toadstools and related plants. Most of the species are saprophytic, but some are capable of becoming parasitic (facultative parasites) as in case of those whose filaments gain access to the interior of the trunks of forest trees where they cause decay of the woody tissues, and even invade the living outer layers. See FUNGI; PLANT DISEASES.

Class 8. *Charophyceæ*.—The Stoneworts are aquatic, green plants related to the Scale Algae and the Red Algae. The plants of these

three classes are the typical *Carpophytes*, and must be regarded as representing the main line of evolutionary progress; the *Sac Fungi* and *Club Fungi* having diverged so much from the typical structure that they are no longer representative. The Stoneworts are erect-stemmed plants, rooted below, and bearing whorled, green branches which function as leaves. Their reproduction is wholly sexual. The egg cell is protected by an upgrowth of tissue before fertilization, instead of afterward, as in the other classes of *Carpophytes*. The motile antherozoids are formed in compound, globular antherids, and on escaping swim by means of their cilia to the egg cell, where they fuse with the egg nucleus. After fertilization the egg becomes covered with a dense wall, but it does not undergo division until it germinates, when it sends out a jointed filament which soon grows into a branching plant similar to the original.

There are about 160 species of Stoneworts, all included in a single order. They occur in fresh or brackish waters, growing attached to the earth by their roots, and having their stems entirely submerged.

Order 24.—*Charales* (Fig. 24), with the characters of the class. There are two families represented typically by the two principal genera, *Nitella*, and *Chara*, both of which are common in most parts of the United States.

BRANCH IV. BRYOPHYTES.—*Mossworks*.—The plants of this branch are all massive, being composed of many layers of cells, which are aggregated into flat bodies (thalli) or erect leafy stems. They are typically terrestrial, although in the lowest family some species are still aquatic, while others have come out a little distance from the water upon the wet earth. All of the species are chlorophyll-bearing, and none are either parasitic or saprophytic. Their reproduction is mostly sexual, and the sexual organs are much like those in the *Carpophytes*, from which no doubt they have been derived. The egg cell is invested from the first with an envelope, as in *Chara*. The antherids are simple, and essentially as in the *Carpophytes*, and in all cases the antherozoids are spirally curved, and provided with two long cilia. After fertilization (which must take place in water, as in a rain drop) the egg divides repeatedly and gives rise to a globular or elongated cellular structure some of whose interior cells ultimately divide into spores. The spores on escaping germinate and eventually give rise to new plants. Their asexual propagation is as follows: upon some part of the plant single cells (brood cells), or masses of cells (brood masses), grow on the ends of short hairs, and falling off, grow directly into new plants. There are two classes.

Class 9. *Hepaticæ*.—The Liverworts are mostly supine, flat plants, attached to the ground by root-hairs for nearly their whole length. By the deeper and deeper lobing of the margins of the thallus it is transformed into a leafy stem, with the leaf-planes parallel to the stem axis. Such leafy stems are as distinctly two-sided (dorsiventral) as the undifferentiated thalli from which they are derived.

There are about 4,000 species of liverworts, which are usually arranged under three orders.

Order 25. *Marchantiales*. (Fig. 25).—In this order are aggregated those liverworts in which the plant is thallose, and the spore cases

VEGETABLE KINGDOM

indehiscent, or irregularly dehiscent. The antherids and archegones are on the upper side of the plant. There are two families, the first of which, the Crystalworts (*Ricciaceæ*), includes small, radiate, thallose plants half an inch or less in diameter, floating on the water, or growing on the wet earth. The antherids and archegones are sunken in the upper surface of the plant body. Their spore cases are globose, stalkless, and indehiscent, and remain enclosed in the archegone wall. Species of *Riccia* (the principal genus) are common. The plants of the second family, the Liverworts (*Marchantiaceæ*) are larger, and dichotomously spreading upon the ground. The thallus is ribbed in its longitudinal axis. The spore case, which becomes short-stalked, breaks open irregularly, and contains spiral elaters mingled with the spores. The antherids and archegones are often elevated on stalks of the thallus, as in *Marchantia*, and *Grimaldia* (Fig. 25).

Order 26. *Anthocerotales*.—The horned Liverworts (Fig. 26) are thin, flat, thallose plants having their antherids and archegones imbedded in their upper surface. After fertilization the egg develops into a club-shaped stalk, in the upper part of which spores and elaters are formed. At maturity the spore-case splits longitudinally into two parts in order to set the spores free.

There is but one family, and the species of the principal genus *Anthoceros*, are rather common on wet ground.

Order 27. *Jungermanniales*.—The Scale-mosses (Fig. 27) are leafy-stemmed (rarely thallose) plants, whose stalked spore cases split vertically into four segments, setting free the spores and elaters. These little plants are commonly mistaken for mosses, which they resemble in external appearance. They grow commonly on trees, stones, and sometimes on the ground. There are about a dozen families, containing 135 genera and nearly 3,600 species. The principal genera are *Plagiochila*, *Jungermannia*, and *Frullania*, whose species are common in many parts of North America.

Class 10. *Musci*.—The Mosses are leafy-stemmed, terrestrial plants, usually erect and attached to the ground by root hairs on the lower part of the stem. The leaf planes are approximately at right angles to the stem axis, and the leaves are only rarely in two rows, generally alternate and crowded. The antherids and archegones are at the summit of the stem, or in the axils of the leaves. The spores on germinating produce a mass of green, branching filaments (protonema) from which later the leafy stems arise.

There are from 4,500 to 5,000 species, and these may be arranged in four orders.

Order 28. *Andreaeales*.—The Black Mosses (Fig. 28) are small, leafy, dark-colored plants, usually growing on rocks. Their leaves are thickish, and are composed of uniform cells. The spore-case is raised on a stalk (pseudopodium) of the leafy plant, and is itself short-stalked at maturity; it splits imperfectly into four (or eight) longitudinal valves for the escape of the spores. There is but one family, containing the single genus *Andreaea*.

Order 29. *Sphagnales*.—The Peat Mosses (Fig. 29) are large, leafy, pale-green plants growing in bogs. Their leaves are thick, and

are composed of dissimilar cells, some containing chlorophyll, and others with perforated walls so as to admit water freely. The spore-case is raised on a pseudopodium, and is itself short-stalked; it opens by a circular lid to permit the escape of the spores. There is but one family, containing the single genus *Sphagnum*. Peat Mosses are much used by gardeners for "packing," on account of their power of retaining moisture for a long time.

Order 30. *Archidiales*.—The Sac Mosses (Fig. 30) are small plants with thin leaves, and a thin-walled, stalkless sac-like spore-case, which is indehiscent. There is but one family, containing the single genus *Archidium*.

Order 31. *Bryales*.—The True Mosses (Fig. 31) are from small to large plants with mostly thin leaves, long-stalked spore-cases, which open by a circular lid, and a fringe of teeth around the mouth of the capsule. Here are collected nearly all of the mosses, including many families and species. In one family (*Phascaceæ*) the spore-cases of the minute plants are indehiscent and almost stalkless. In the remaining

FIG. 26.—Fruiting plant of a Horned Liverwort (*Anthoceros*); slightly reduced.

FIG. 27.—A Scale-moss (*Plagiochila*) in fruit; about natural size.

FIG. 28.—Branches of a Black Moss (*Andreaea*); somewhat magnified.

FIG. 29.—Portion of a Peat Moss (*Sphagnum*) in fruit; slightly reduced.

families the spore-case opens by a circular lid. When the lid falls away the mouth is naked in some genera, but usually it is fringed with one or two rows of 4, 8, 16, 32, or 64 teeth, constituting the so-called peristome. Mosses are further distinguished by the terminal or lateral position of the spore-cases.

Some of the common genera are *Phascum*, *Orthotrichum*, *Funaria*, *Bryum*, *Mnium*, *Polypodium*, with spore-cases terminal, and *Fontinalis*, *Neckera*, *Leskea*, *Climacium*, and *Hypnum*, with spore-cases lateral.

BRANCH V. *PTERIDOPHYTES*.—The Fernworts. —Fernworts are small thalloid plants mostly attached to the ground by root hairs, and bearing antherids and archegones, which after fertilization produce stems which bear leaves and spores above and roots below. The sexual organs resemble those of the Liverworts and Mosses, and fertilization still takes place in the water, the antherozoids being spiral and supplied with two to many long cilia. Asexual reproduction as it occurs in the lower plants is wanting.

In this branch the alternation of generations which became pretty definite in the Bryophyta assumes a far greater importance. While in the Liverworts and Mosses the plant (gametophyte) which produces the sexual cells (gametes) is long-lived, and the spore-case and its stalk (sporophyte) short-lived, the opposite is the condition in the Fernworts. Here the game-

VEGETABLE KINGDOM

tophyte is a thallus (like that in *Anthoceros*), and after fertilization an axis is produced which eventually is spore-bearing above. This spore-bearing axis (sporophyte) develops roots below and becomes independent of the gametophyte. This independence permits it to defer the production of spores, which may not be formed for many years in extreme cases. This independence also permits the early death and decay of the gametophyte, which actually becomes shorter and shorter-lived as the sporophyte becomes longer-lived. In the Fernworts, therefore, the sporophyte becomes the important gen-

pinnately compound. In geological times there were many species which have long been extinct.

Order 34. *Isoetineæ*.—The Quillworts (Fig. 34) develop small, dioecious globular gametophytes, those producing archegonia not escaping from the spore-wall, short, thick-stemmed, narrow-leaved sporophytes, and internal (finally erumpent) spore-cases on the upper surface of the leaf bases. The spores are of two kinds, microspores (small), and megaspores (large). There is a single family, including but one genus (*Isoetes*) of aquatic plants, which are from an inch to a foot or more in height.

Order 35. *Filices*.—The True Ferns (Fig. 35) have flat, often heart-shaped, green gametophytes, commonly long-stemmed, broad-leaved sporophytes, and external, usually stalked, spore-cases, on the under surface of the leaves. Here we find the great majority of the ferns, including not only the common small kinds, but also those whose erect stems are of such considerable height that they constitute the tree ferns of the tropics. There are many genera, constituting six or more families. Among the common genera represented in North America are *Polypodium*, *Aspidium*, *Asplenium*, *Adiantum*, *Woodsia*, etc.

Order 36. *Hydropteridineæ*.—The Water Ferns (Fig. 36) produce small, globose, dioecious gametophytes, those producing archegones not escaping from the spore-wall, slender, running-stemmed sporophytes with floating, or erect, quadrifoliate leaves, and spores borne in stalked spore-cases on certain folded leaves

FIG. 30.—Plant of a Sac Moss (*Archidium*); somewhat enlarged.

FIG. 34.—Plant of a Quillwort (*Isoetes*); somewhat reduced.

eration, in marked contrast to the Mossworts in which the gametophyte is the principal plant, the sporophyte being distinctly secondary.

There are three classes.

Class 11. *Filicinaæ*.—The Ferns have small, flat gametophytes, attached to the ground by rhizoids (root hairs), or they may be still smaller and without rhizoids. The sporophytes are solid-stemmed, usually producing large spore-bearing leaves, and well developed roots.

There are fully 3,500 species of ferns, which may be distributed among six orders.

Order 32. *Ophioglosseæ*.—The Adder-tongues (Fig. 32) have subterranean gametophytes, short-stemmed sporophytes, few leaves, and internally formed spores. There is but one family, and the genera are *Ophioglossum* and *Botrychium*.

Order 33. *Marattiææ*.—The Ringless Ferns (Fig. 33) have flat, green, liverwort-like gametophytes, short, thick, large-stemmed, large-leaved sporophytes, and internal (finally erumpent) spore-cases on the dorsal surfaces of the leaves. There are but few genera (all of tropical regions) and they are included in a single family. *Marattia*, *Angiopteris* and *Danawa* are grown in plant houses. Some species have leaves 10 to 15 feet in length and repeatedly

FIG. 35.—Plant of one of the True Ferns (*Woodsia*); much reduced.
FIG. 36.—Plant of a Water Fern (*Marsilia*); considerably reduced.
FIG. 37.—One of the Floating Ferns (*Salvinia*); considerably reduced.

(sporophylls). The spores are of two kinds (microspores and megaspores).

There is but one family of these pretty, aquatic or mud-loving plants. The principal genus is *Marsilia*; which is represented by several species in North America.

Order 37. *Salvinicææ*.—The Floating Ferns (Fig. 37) have small, globose, dioecious gametophytes, the archegonial not escaping from the spore-wall, slender-stemmed, floating, often minute sporophytes, bearing many small two-ranked simple leaves. Spore-cases, borne on certain folded leaves. The spores are of two kinds (microspores and megaspores).

There is but one family, containing two genera,—*Salvinia* and *Azolla*,—whose species float on ponds and slow streams.

Class 12. *Equisetinaææ*.—The Horsetails have small flat, or erect-lobed gametophytes, attached

VEGETABLE KINGDOM

to the ground by rhizoids. Their sporophytes are hollow, jointed stems, rooted below. Their foliage leaves are minute and whorled, their sporophylls are shield-shaped and clustered in a cone at the end of the stem.

These plants now number not more than 25 to 30 species, and are all included in a single order. Formerly there were other orders, including species which formed large trees.

Order 38.—*Equisetales* (Fig. 38) are common rush-like, nearly leafless plants (sporophytes), with hollow, jointed stems. Their stems are green, and in some species the epidermis is so filled with silica that they are used for scouring cutlery, whence the name "scouring rush." They are frequently known as "joint rushes." There is but one family, and the solitary surviving genus is *Equisetum*.

Class 13. *Lycopodiinae*.—The Lycopods have small globular or tuber-like gametophytes, which are pale or little colored, and but slightly attached (if at all) to the ground. The sporophyte has a solid stem, having many, usually crowded, small leaves, which are in four or many ranks. The sporophylls are similar to the green leaves, and form a cone at the end of the stem.

These plants now number about 600 species, and constitute two orders. Formerly there were many more species (some trees) constituting other orders.

Order 39. *Lycopodiales*.—The Club Mosses (Fig. 39) produce but one kind of spore, and from these are developed tuber-like gametophytes which bear antherids and archegones.

The sporophytes of these plants are evergreen, and trail on the ground, sending up vertical cone-bearing stems at frequent intervals. There is but one family, and the principal genus, —*Lycopodium*,—contains many species, some of which are known as Ground Pines, and are much used for Christmas decorations.

Order 40. (*Selaginellales*.—The Little Club Mosses (Fig. 40) produce two kinds of spores (microspores and megaspores), the former producing small antheridial gametophytes, and the latter globular archegonial gametophytes. The sporophytes are evergreen, and resemble those of the preceding order.

There is a single family, and but one genus, —*Selaginella*,—of which there are about 500 species, mostly tropical, a few occurring in different parts of the United States. Some species are grown in greenhouses.

BRANCH VI. SPERMATOPHYTES.—*Seed Plants*.—In this highest branch of the vegetable kingdom the sporophyte is the only generation which is visible to the naked eye, the gametophyte being very much reduced, and so small as to require a microscope for its examination. The archegonial gametophyte is minute, and permanently enclosed within the tissues of the ovule (and seed); the antheridial gametophyte is reduced to little more than a tubular filament. The sporophyte is typically a leafy stem, with roots below, and bearing clusters (strobili, cones) of sporophylls (flowers, in the higher orders) in which are produced microspores and megaspores, and eventually seeds, which are characteristic of the branch. The seed is derived from the spore-case (megasporangium) of the Fernworts, and is for a time a true spore-case; however the spore does not escape from it,

but directly develops the archegonial gametophyte, and one or more eggs, which on fertilization produce one or more young sporophytes. When this complex state is reached (in which there are tissues of (1) the old sporophyte, (2) the enclosed gametophyte, and (3) the young sporophyte) the seed is separated from its supporting tissues, and falls to the ground.

The alteration of generations which became so marked in the Fernworts, is here as sharply defined, but it is not as obvious, and is in fact generally overlooked. The very great emphasis which is placed upon the sporophyte has been accompanied by a lessening importance of the gametophyte. There are two classes.

Class 14. *Gymnospermae*.—The Gymnosperms. The megaspores produce small, ovoid, cellular gametophytes, permanently enclosed in the spore-cases (ovules), which are formed on open sporophylls. These spore-cases are early covered by a coat (seed coat) for further protection. The microspores (pollen cells) which germinate upon the ovules, penetrate to the enclosed gametophyte and fertilize an egg. The mature sporophyte is often a great tree a hundred or more feet in height, and living for many years.

There are now living a few more than 400 species of Gymnosperms, representing four or-

FIG. 38.—Plant of a Horsetail (*Equisetum*), green plant at the right, pale spore-bearing plant at the left; much reduced.

FIG. 39.—Part of a Club Moss plant (*Lycopodium*), with spore-bearing cones; much reduced.

FIG. 40.—Part of a Little Club Moss plant (*Selaginella*), with many spore-bearing cones; somewhat reduced.

ders. Many species which existed in geological times have long since become extinct. The orders are characterized almost entirely by the structure of the sporophyte.

Order 41. *Cycadinae*.—The Cycads (Fig. 41) have erect, mostly unbranched stems, bearing a crown of pinnately compound leaves. The microsporophylls (stamens) are in cones; the megasporophylls in terminal whorls on the main stem, or in cones. The germinating microspore (pollen) produces a tubular gametophyte, which develops two ciliated, motile antherozoids.

There are about 80, mostly tropical species, in two families. Species of *Cycas* and *Zamia* are commonly grown in greenhouses.

Order 42. *Ginkgoinea*.—The Ginkgo Tree (Fig. 42) is the sole surviving representative of this order. It is a branched tree bearing fan-shaped leaves, a couple of inches in diameter, drooping clusters of stamens, and pairs of ovules on naked sporophylls. Its pollen cells

VEGETABLE KINGDOM

on germinating produce ciliated, motile antherozoids. *Ginkgo*, the only genus, with its solitary species, represents the single family. It is a native of Japan and China, but is now much grown in the United States.

Order 43. *Conifera*.—The Conifers (Fig. 43) are mostly tall, resinous trees, with small or needle-shaped, generally evergreen leaves. Their microsporophylls are in cones, and their megasporophylls usually in cones, less commonly solitary. On germination the microspore produces a tubular gametophyte, but the antherozoids are not ciliated.

FIG. 41.—Plant of a Cycad (*Cycas*); greatly reduced.
FIG. 42.—Leaves and cluster of stamens of *Ginkgo* (at left), and naked seed (at right); considerably reduced.
FIG. 43.—Pine-tree (*Sporophyte*); very much reduced.

There are two families. The more common genera are *Pinus* (pines), *Larix* (larches), *Picea* (spruces), *Abies* (firs), *Cupressus* (cypresses), *Sequoia* (redwoods), *Juniperus* (juni-pers), *Taxus* (yew-trees), etc.

Order 44. *Gnetacea*.—The Joint-firs (Fig. 44) are mostly branched, non-resinous shrubs, with small (or large) opposite leaves. The three genera, *Ephedra*, *Gnetum*, and *Tumboa* are placed in a single family. *Tumboa* includes a curious South African stump-like shrub, with but two large, parallel-veined leaves, and large red cones.

Class 15. *Angiosperma*.—The Angiosperms. In this class the archegonial gametophyte is of still simpler structure, being reduced to a sac-like body (coenocyte containing a number of nuclei, one of which is the egg. After the fertilization of the egg there is a considerable growth of gametophyte tissue (endosperm) in the seed. The microspores on germination produce tubular gametophytes, each with two non-ciliated antherozoids. The mature sporophyte is an axis, rooted below, and bearing leaves above. The sporophylls are usually clustered in cones (strobili) at the ends of special branches; the uppermost (carpels) produce megaspores, the next (stamens) produce microspores (pollen), while the lower are usually sterile and colored (petals, and sepals). Each

carpel is so folded as to enclose the ovules (megasporeangia), and later the seeds.

Here are to be found the great mass of "flowering plants," numbering more than 100,000 species. The 13 orders are arranged under two sub-classes. All of the characters which are used in the classification of this vast number of plants are derived from the sporophyte.

Sub-Class 1. *Monocotyledonea*.—The Monocotyledons. The young sporophyte in the seed has a single terminal seed-leaf ("cotyledon"), and on growing it continues to have alternate, usually parallel-veined, leaves. The fibrovascular bundles of the stem are scattered (not arranged in circular layers), and there is no definite bark. The roots are clustered at the base of the stem, and there is no tap-root. The flowers consist of sporophylls which are usually in whorls of three each. The sterile sporophylls are usually in two whorls, and are often of different texture (petals and sepals).

There are eight pretty well marked orders, including about 20,000 species.

Order 45. *Alismales*.—The Water Plantains (Fig. 45) have their carpels separate, and usually several or many, and the other parts of the flower are also distinct (not united with one another). The plants are aquatic or nearly so. There are three families, and many genera, all of herbaceous plants, of which familiar examples are *Alisma* (Water Plantains, proper), *Sagittaria* (Arrowheads), and *Potamogeton* (Pondweeds). The plants of this order are evidently related to the *Ranales* and *Rosales* in the Dicotyledons, to be noticed later.

Order 46. *Liliales*.—The Lilies (Fig. 46) have their carpels reduced to three, and these are united into one structure, the compound pistil, which contains several to many ovules. The other parts of the flower are nearly distinct, and well developed. The sterile sporo-

FIG. 44.—Fragment of a Joint-fir (*Ephedra*), with clusters of stamens; considerably reduced.
FIG. 45.—Plant of Water Plantain (*Alisma*), in flower; much reduced.
FIG. 46.—Plants of a Lily (*Lilium*), in blossom; greatly reduced.

phylls (petals and sepals) are typically well developed, and relatively much larger than those which have spores (stamens and carpels).

Here are to be found many of the most beautiful flowering plants, as the Lilies proper (*Lilium*), Lily of the Valley (*Convallaria*), Crown Imperial (*Fritillaria*), Tulips (*Tulipa*), Mariposa Lilies (*Calochortus*), Spring Lilies (*Erythronium*), Hyacinths (*Hyacinthus*), Day Lilies (*Hemerocallis* and *Funkia*), etc.

There are eight to ten families, and nearly all are composed of herbaceous plants.

VEGETABLE KINGDOM

Order 47. *Aroidales*.—The Aroids (Fig. 47) have a flower structure derived from that of the Liliales. The pistil is typically tricarpeal, each carpel usually with two or more ovules, and the petals and sepals (perianth) are reduced to scales, or are entirely wanting. In many cases the small reduced flowers are clustered on a dense, fleshy spike and partly or wholly covered by a large bract (spathe).

There are several families and many genera, of mostly herbaceous plants, among which are the Calla Lilies (*Calla*, *Caladium*, and *Richardia*), Jack-in-the-Pulpit (*Arisaema*), Sweet Flag (*Acorus*), Screw Pines (*Pandanus*), Cat-tails (*Typha*), and the curious little floating Duckweeds (*Lemna*).

FIG. 47.—A Calla Lily (*Richardia*), in blossom; greatly reduced.

FIG. 48.—A Date Palm (*Phoenix*); greatly reduced.

FIG. 49.—A Brome Grass (*Bromus*), in blossom; greatly reduced.

Order 48. *Palmales*.—The Palms (Fig. 48) are nearly all shrubs or trees, often 50 to 100 feet in height. Their stems bear a crown of pinnate or palmate leaves at their summits, and among them are the clusters of small flowers, which are evidently derived from those of the Liliales. The pistil is tricarpeal (except in a few cases), and there is usually but one ovule in each carpel. In some cases but one of these ovules develops into a seed, as in the coconut palm. The perianth is reduced to small scales.

The principal family includes the palms (*Palmaceæ*) of which there are more than 1,100 species, all natives of warm climates. Among these are the Coconut Palm (*Cocos*), "the most useful plant in the world," the Date Palm (*Phoenix*), the Palmetto (*Sabal*), the Rattan Palm (*Calamus*), besides many grown in greenhouses for ornamental purposes.

Order 49. *Glumales*.—The Grasses (Fig. 49) are mostly herbaceous plants with slender stems and simple, narrow leaves. The compound pistil is tricarpeal to bicarpeal (rarely monocarpeal). In the Sedges and Grasses, which include nine tenths of the species, there is but one ovule in the pistil, which is always either tricarpeal or bicarpeal. The stamens are mostly three or six, and the perianth is reduced to small scales, or is entirely wanting. The flowers are usually clustered in chaffy spikelets. There are five families and many genera.

Here are to be found the vast numbers of sedges and grasses which clothe the earth with a mantle of green, and afford food for the roving herds of wild and domesticated

animals. Added to these are several families of rush-like plants which are so closely related that we can not exclude them. Timothy (*Phleum*), Red Top (*Agrostis*), Orchard Grass (*Dactylis*), Brome Grass (*Bromus*), are some of the grasses cultivated for forage, while Wheat (*Triticum*), Rye (*Secale*), Oats (*Avena*), Barley (*Hordeum*), Maize (*Zea*), and Rice (*Oryza*), are cereal grasses. The Bamboos (*Bambusa*) are large perennial woody grasses which attain tree-like dimensions in warm climates.

Order 50. *Hydrales*.—The Waterworts (Fig. 50) are small aquatic herbaceous plants having a compound, tricarpeal inferior pistil. The perianth is regular and in two whorls. These small plants constitute a single family. Eel-grass (*Vallisneria*), and Water-weed (*Elodea*) are common plants of this order; the latter is a pest in streams, filling them up and sometimes impeding navigation.

Order 51. *Iridales*.—The Irids (Fig. 51) are terrestrial herbs with a compound, tricarpeal, inferior pistil, with mostly regular perianth whorls. Here are half a dozen or so families, including the Yams (*Dioscorea*), Amaryllises (*Amaryllis*), Irises (*Iris*), Pineapples (*Ananas*), Bananas (*Musa*), Ginger (*Zingiber*), Cannas (*Canna*), Jonquils (*Narcissus*), etc.

Order 52. *Orchidales*.—The Orchids (Fig. 52) are terrestrial or epiphytic herbs, with a compound, tricarpeal, inferior pistil, one or two stamens, and irregular (zygomorphic) perianth whorls.

There are two families, one of which containing the Orchids proper, numbers upward of 5,000 species, of mostly tropical plants. Many genera of orchids contain species of rare beauty, as *Cypripedium* (Lady's-slipper), *Orchis*, *Platanthera*, *Calypto*, *Cattleya*, *Stanhopea*, *Gongora*, *Catasetum*, *Dendrobium*, *Oncidium*, *Odo-*

FIG. 52.—An epiphytic Orchid (*Gongora*), with pendent flower clusters; greatly reduced.

toglossum, etc. Many species are grown in greenhouses.

Sub-Class *Dicotyledoneæ*. The Dicotyledons. The stem of the young sporophyte is provided sub-terminally with two seed-leaves (cotyledons), and on growing it continues to have opposite leaves, or sooner or later they may become alternate. The leaves are usually netted veined, and they are often more or less branched (lobed or "compound"). The fibro-vascular bundles of the stem are usually arranged in circular layers, and permanent stems

VEGETABLE KINGDOM

increase in diameter by the addition of annual layers of such fibrovascular bundles. In permanent stems the outer tissues constitute a well-defined bark. The roots normally branch from a tap root which is a downward continuation of the axis of the plant, but in some cases the roots are clustered much as in Monocotyledons. The flowers consist of sporophylls which are usually in whorls of five each. The sterile sporophylls are usually in whorls, and are mostly of different texture (petals and sepals).

There are about 200 families (including about 80,000 species) which have been variously grouped into orders by botanists. Although the number of genera and species is so great they are all closely related, and it is not difficult to bring them within five fairly well defined groups, here called orders. These orders are divisible into sub-orders, and most recent botanists elevate these to the rank of orders, but their limits are often so vague, and their characters so poorly defined, that they are treated here as of lower rank than orders.

Order 53. *Thalamifloræ*. (Fig. 53.)—In this order the sporophylls are all attached directly to the flower axis (thalamus). The carpels which

FIG. 53.—A Buttercup (*Ranunculus*) in blossom; greatly reduced.

are many and distinct in the lower genera, are reduced in number and united into a compound pistil in the higher genera. The stamens are many in the lower genera, and normally 5 to 10 in the higher. The petals are distinct (choripetalous), regular, and normally five, sometimes of less number, or minute, or entirely wanting (apetalous). The sepals are distinct (or sometimes united in the higher genera), and are usually green (in apetalous flowers they are often petaloid).

There are about 23,000 species in this order. They constitute about 70 families. These families are grouped into seven suborders, as follows: *Ranales* (including buttercups, magnolias, barberries, laurels, water lilies, etc.), *Paricetales* (poppies, mustards, mignonettes, violets, pitcher-plants, etc.), *Polygalales* (milk-worts), *Caryophyllales* (pinks, tamarisks, willows, portulacas, four o'clocks, amaranths, chenopods, knotweeds, etc.), *Geraniales* (flaxes, geraniums, rue, oranges, lemons, etc.), *Guttiferales* (teas, hypericums, etc.), *Malvales* (lindens, mallows, cottons, nettles, elms, euphorbias, peppers, etc.). The first of these sub-orders (*Ranales*) is evidently related to the *Alismales*, and the *Rosales*.

Order 54. *Heteromera*. (Fig. 54.)—The sporophylls are usually all attached directly to the flower axis, but in some families the stamens are attached to the petals. The carpels are from two to many, always united into a compound pistil. The stamens are mostly in one or two whorls, usually of four or five each. The petals are united with each other (gamopetalous), and are usually four or five, and form a regular corolla. The sepals are commonly united (gamosepalous) more or less, and are usually green.

There are about 3,500 species in this order, which is divided quite naturally into three sub-orders (including 15 to 20 families), as follows: *Primulales* (including primroses, plumbagos and plantains), *Ericales* (huckleberries, cranberries, heaths, rhododendrons, etc.), *Ebenales* (star-apples, ebonyworts, storax, etc.).

Order 55. *Bicarpellata*. (Fig. 55.)—The sporophylls are usually attached directly to the flower axis, excepting the stamens which are usually attached to the petals. The carpels are usually two (rarely more in the lower genera) and are always united into a compound pistil.

FIG. 54.—Flower and leaf of a Primrose (*Primula*); greatly reduced.

FIG. 55.—A Foxglove (*Digitalis*), in bloom; greatly reduced.

FIG. 56.—Flowers and leaf of Strawberry (*Fragaria*); greatly reduced.

FIG. 57.—Leaf and flower-heads of Compass Plant (*Silphium*), one of the Asterales; greatly reduced.

In the lower genera the seeds are usually many, but they are two in each carpel in the higher. The stamens are normally five, but in the higher genera some of them are usually abortive. The petals are five and united with each other (gamopetalous), and the corolla is regular (in the lower genera) and more or less irregular (zygomorphic) in the higher genera. The sepals are commonly united, and are generally green.

There are approximately 16,000 species, representing about 20 families, in this order. There are four sub-orders, namely: *Primulales* (including phloxes, gillias, morning-glories, heliotropes, forget-me-nots, nightshades, tobacco, tomato, potato, etc.), *Gentianales* (olives, ashes, lilacs, dogbanes, milkweeds, jessamines, and gentians), *Personales* (mulleins, snapdragons, figworts, foxgloves, broomrapes, bladderworts, trumpet creepers, catalpas etc.), *Lamiales* (verbenas, mints, hyssop, thyme, catnip, sages, etc.).

Order 56. *Calyciflora*. (Fig. 56.)—The sporophylls are usually attached to a disk- or cup-like expansion of the flower axis. In the lower genera the carpels are many, and distinct, but they are reduced in number and united into a compound pistil, which is more or less overgrown by the cup of the flower axis (inferior pistil) in the higher genera, and there is a general reduction in the number of seeds in each carpel, to the higher genera where there is but one for each carpel. The stamens, which are attached to the rim of the disk or cup, are many in the lower genera, but are reduced to a single whorl of five in the higher. The petals (attached to the disk or cup) are mostly five, and distinct (choripetalous), or they may be minute or wanting; they are mostly regular, but in one large family they are irregular (zygomorphic).

VEGETABLES, FOOD VALUE

The petals (which are attached to the disk or cup) are distinct, or more or less united, and are green and herbaceous (except in apetalous flowers, where they usually become petaloid), or they may be reduced to mere vestiges, or even be entirely wanting.

Here are aggregated fully 25,000 species, representing more than 50 families. There are seven sub-orders, namely: *Rosales* (including cinquefoils, strawberries, spiræas, roses, cherries, plums, apples, acacias, vetches, beans, peas, clovers, lupines, saxifrages, currants, witch-hazels, plane trees, etc.), *Myrtales* (myrtles, eucalypts, evening primroses, fuchsias, etc.), *Passiflorales* (mentzelias, passion flowers, squashes, gourds, begonias, etc.), *Cactales* (cactuses), *Celastrales* (buckthorns, bittersweets, sandalwoods, mistletoes, hollies, grapes, oleasters, etc.), *Sapindales* (horse-chestnuts, maples, sumachs, walnuts, hickories, birches, beeches, oaks, etc.), *Umbellales* (ginsengs, ivy, parsley, parsnip, celery, caraway, dogwood, pepperidge, etc.).

The first sub-order *Rosales* is very certainly related quite closely to the sub-order *Ranales*, of the *Thalamiflora*, and also to the *Alismales*, among the Monocotyledons.

Order 57. *Inferæ*. (Fig. 57.)—The petals and sepals are attached to the summit of the cup-like outgrowth of the flower axis, which has completely overgrown and enclosed the pistil. The carpels are several in the lower genera, but in the higher they are reduced to two, and are always enclosed in the cup of the flower axis (inferior). The seeds are few, and in the higher genera are reduced to but one for the two carpels. The stamens are five, and are attached to the petals. The petals are five and united (gamopetalous). The sepals are reduced to a fringe of scales, or bristles (pappus), or they may be minute or wanting.

There are about 16,000 species, representing nine families. There are three sub-orders, namely: *Rubiales* (including bluets, button-bush, bedstraw, coffee, cinchona, honeysuckles, elders, snowball, etc.), *Campanales* (harebells, bellflowers, lobelias, etc.), *Asterales* (valerians, teasels, sunflowers, coneflowers, ragweeds, asters, goldenrods, ironweeds, chrysanthemums, wormwoods, daisies, thistles, lettuce, and dandelions).

The only recent work covering the vegetable kingdom is Engler and Prantl's 'Die natürlichen Pflanzenfamilien,' now being published in Germany, and to include about 15 volumes.

CHARLES F. BESSEY,

Professor of Botany, University of Nebraska.

Vegetables, Food Value of. The function of food is to build up the tissues of the body and keep them in repair, to yield energy in the form of heat, to keep the body warm, and to create strength to enable it to do its work. A diet to accomplish all this must contain the nutrients, water, nitrogenous substances, or proteids (classified as protein), also fats, carbohydrates (sugar, starch, cellulose, etc.), and mineral matters, such as sodium chloride (common salt) and phosphate of lime. Animal foods, meat, eggs, cheese, etc., are rich in protein, but not in carbohydrates. With the exception of butter, lard, and the fat of pork, they yield but little heat, and as a rule should be associated with other foods to form a complete diet. Cereals

(corn, wheat, etc.), on the other hand, though classed among the vegetable foods, furnish a very large proportion of the actual nutrients in the ordinary diet, and more economically than animal foods, for which they may be substituted. Combined with milk, fruit, and nuts, they form a complete diet. Vegetables as a rule are deficient in fat and protein, but rich in carbohydrates, and some of them contain beneficial juices and salts. While a vegetable diet is often of great service in neurasthenia, gastric neurosis, etc., for healthy persons the objections to a strictly vegetable diet are based upon the large amount of material required to furnish necessary protein, the amount of residue to be got rid of by the body, and the monotony of the diet. Most of the so-called vegetarians are merely non-meat-eaters, for they consume milk, butter, eggs, cheese, and sometimes fish. The fact is that man is an omnivorous animal, his digestive apparatus is adapted for the digestion of both animal and vegetable foods, and usually he needs both in moderation. Vegetables are too often considered merely as a pleasant addition to the diet, and not a necessity. Most families use but 12 or 15 different kinds of vegetables, whereas the large markets in our cities have for sale throughout the year about 50 varieties. The United States government has recently encouraged the increased use of vegetables, and through investigations and experiments has added to our knowledge of their food value. For example, the purslane and other so-called weeds have been found to be useful as food, and the propagation and use as food of the roots, tubers, beans, bulbs, and various plants heretofore grown and used as food almost exclusively by the Chinese, such as lily bulbs, the lotus, taro, and ginseng, are recommended to Americans. The malates, citrates, and other salts found in certain vegetables are indispensable in food, as they are converted into carbonates in the body, and furnish some of the alkalies to the blood and other fluids. Potatoes, onions, and fresh salad vegetables, such as tomatoes, cabbage, greens, lettuce, corn, and cucumbers are excellent preventives of scurvy (q.v.), and in the spring, after the heavy winter diet (more or less of meat) their juices and salts are especially beneficial. These vegetables, together with oranges, lemons, limes, and apples, may well be substituted for so-called spring medicines. Vegetables are also needed for their bulk, which is an important adjuvant in maintaining the necessary movements of the intestines. The popular idea that vegetables are especially valuable in the relief of various ailments has but little foundation in fact.

Much of the indigestion following the use of certain vegetables is due either to insufficient cooking or to the fact that the vegetables are not fresh. The Irish potato, the "king of vegetables," lacks protein, fat, and salts, and should be eaten with butter and salt, pot liquor, meat gravy, or fat meat, and associated with some nitrogenous food. The legumes, beans, peas, and lentils differ from other vegetables by reason of the large amount of protein they contain, as well as mineral matter, chiefly lime and potassium salts, but fat is needed with them to furnish the necessary nutrients, hence "pork and beans." They need also, especially when dried, to be thoroughly cooked, and are

best adapted to persons who do outdoor work. The flatulence which they sometimes produce, especially in persons of sedentary occupation, constitutes one objection to their use. Legumes may well be called the "meat of the poor." In Mexico the frijole (a variety of bean) is the staple food next to maize; and in the Orient the soy bean and its products, bean-cheese, etc., rank next to rice. In India lentils form the staple diet. There is a Hindu proverb that says: "Rice is good, but lentils are my life." The Arabs feed ground beans to their horses when extraordinary exertion is needed of them. Finely ground peas, beans, and lentils form the basis of many soup-tablets, and of condensed foods used by armies, explorers, etc. The peasausage of the German army was composed of lentil flour, bacon, and seasonings. Government reports show that the Southern negro, though having salt pork, wheat flour, cornmeal, molasses, and milk, needs also vegetable food to keep him in a proper condition of health. See **FOOD; NUTRITION OF MAN.**

Vegetarianism, the theory and practice of living on vegetables and abstaining entirely from flesh food, or from all food obtained by the killing of animals. The abstinence from flesh food is the essential element in the connotation of the word vegetarianism; but vegetarians are usually also total abstainers from alcoholic liquors, and in regard to the use of such animal products as eggs, milk, butter, and cheese, and of cereals, as well as on the advisability of cooking food, different views are held among them. The average vegetarian admits into his diet the animal products above mentioned, and there are semi-vegetarians who also eat fish. The arguments for and against a vegetarian diet fall into three main classes, physiological and hygienic, ethical, economic.

Vegetarians claim that man is closely akin to an exclusively frugivorous group, the apes, and widely different from carnivora, herbivora, and omnivora. They assert, what is universally admitted, that the actual state of mankind and the science of physiology both show that a complete fleshless diet is possible and readily procurable, and they argue that if such be the case any moral arguments that may be advanced against the eating of flesh ought to have decisive weight. Anti-vegetarians object, that with a purely vegetable diet an enormous amount must be consumed in order to obtain sufficient nutriment, and that the waste products are excessive in quantity; but it is to be noticed that whatever be the force of this argument against extreme vegetarians, it can hardly be maintained against those who admit eggs, milk, etc. Vegetarians maintain that flesh-eating is responsible for the propagation of some of the most serious diseases, notably tuberculosis and cancer, and they contend that it hinders the development of the higher nature of man both by its physiological influence and by the necessity of systematic slaughter entailed by it. It has been objected, that if animals now regularly slaughtered were allowed to breed unchecked the country would be overrun by them, but the possible answers to this argument are obvious. It is also claimed by vegetarianism that it is in such products as nuts, seeds, roots, eggs, and milk, and not in the comparatively degenerate form of flesh, that nature provides the

means of supporting life in its best and most nutritive form.

In a very recent work on the subject M. Gautier says: "The vegetarian diet is not suited to European organs. But relieved by the addition of milk, grain, butter, cheese, eggs, etc., it offers many advantages. It alkalizes the blood, it regulates the circulation, and preserves the elasticity of the arteries; . . . it makes one less liable to danger from maladies of the skin and of the joints, and to congestions of the internal organs. It tends to soften the disposition, — to make us more calm and less agitated, aggressive, and violent. It is practical and rational. It ought to be accepted, if one follows an ideal for the establishment of an education for races of men who are to be sweet-tempered, intelligent, artistic, peace-loving, yet nevertheless prolific, vigorous, and active."

Vegetarianism is as old as the ancient religion of Hindustan, and was taught by Plato, Plutarch, and other writers of classical antiquity. One of the oldest pioneers of the movement in Great Britain was George Cheyne (1671–1743), a Scottish doctor, who supported it in an 'Essay on Regimen,' published in 1740. Shelley's vindication of natural diet is well known. J. F. Newton's 'Return to Nature, or Defense of Vegetable Regimen,' was published in 1811, and in 1847 the Vegetarian Society was founded at Manchester. Eduard Baltzer (1814–87), a German liberal clergyman, introduced the movement into Germany, and founded at Nordhausen in 1868 a "Verein von Freunden der Natürlichen Lebensweise." His book on 'Die Natürliche Lebensweise' reached a 4th edition in 1896. Other leading German pioneers of vegetarianism are Gustave von Struve (1805–70), author of 'Die Pflanzenkost, die Grundlage einer neuen Weltanschauung' (1869), in which he associates vegetarianism with socialism; and Theodore Hahn, author of 'Die Naturgemässe Diät' (1859) and 'Der Vegetarianismus' (1866). Vegetarianism has obtained less hold in France than in Great Britain and Germany. Among the chief French works on it are the 'Thalysie, ou la nouvelle Existence' (1821) of Jean Antoine Gleizès (1773–1843), and 'Le Végétarisme rationnel scientifique' (1889) of Dr. E. Bonnejoy. The early leaders of vegetarianism in America were Amos Bronson Alcott (q.v.) (born 1799), father of Louisa May Alcott; Sylvester Graham (1794–1851), author of 'The Science of Human Life' (1839); and Charles Lane, author of 'A Brief Practical Essay on Vegetable Diet' (1847). The Vegetarian Federal Union was founded in 1889, and several societies throughout the world are affiliated to it. Vegetarian restaurants are now comparatively common. For further information see the periodicals devoted to vegetarianism and the following works: Kingsford, 'The Perfect Way in Diet' (1881); Williams, 'The Ethics of Diet' (1883), a sort of encyclopædia of the subject; Smith, 'Fruits and Farinacea the Proper Food for Man' (abridged ed. by F. W. Newman); Newman, 'Essays on Diet' (1883); Salt, 'A Plea for Vegetarianism' (1886); Richardson, 'Foods for Man' (1891); Hills, 'Essay on Vegetarianism' (1893); and Oldfield, 'Tuberculosis: Flesh-eating a Cause of Consumption.'

Vehmgerichte, fām'gē-rīn'tē (Ger., 'tribunals of punishment'), or **Vehmic Courts**,

D. DIEGO VELÁZQUEZ

German mediæval courts of justice. They originated in Westphalia. They were composed of free judges (*Wissende*, "initiated"), bound to secrecy, presided over by a *Freigraf* (free count), and convened in both open and secret tribunals, the latter being for more serious offenses. The emperor and the archbishop of Cologne (lord of Westphalia) were at least nominal members. Originally, in a period of confusion, when the petty baronial courts rendered inadequate justice, the *Vehmgerichte* attempted to judge fairly and impartially, and to enforce recognition of law. They came, however, to employ their extensive authority in an arbitrary manner, and to use great cruelty in punishment. Maximilian I. greatly abridged their power by a new code, promulgated in 1495. In Westphalia they held secret meetings until finally abolished in 1811. Consult: Lindner, 'Die Veme' (1888); Thudicum, 'Fehmgericht und Inquisition' (1889); Lindner, 'Der angebliche Ursprung der Vehmgerichte aus der Inquisition' (1890); Wiegand, 'Das Femgericht Westfalens' (2d ed. 1893).

Veii, vē'yī, Italy, an ancient Etrurian city, on the river Cremera, its site generally supposed to be marked by the ruins found near the modern village of Isola Farnese, 12 miles northwest of Rome. Veii was celebrated in the early history of Rome, with which it had several wars. The last war was between 405 and 396 B.C., when the city was taken by Camillus and laid waste. Cæsar, and afterward Augustus, established a Roman colony at Veii; but it had again become of little importance in Hadrian's reign.

Veins. See ANATOMY; CIRCULATION; PHYSIOLOGY.

Veit, fit, Philipp, German painter: b. Berlin 1793; d. Mayence 18 Dec. 1877. He was grandson of Moses Mendelssohn and stepson of Friedrich Schlegel, and after studying art in Dresden he went to Rome, where he became a member of the circle of the Nazarenes (q.v.)—German Pre-Raphaelites of a religious, romantic and mediæval tendency in art, of which Cornelius (q.v.) and Overbeck (q.v.) were the chief representatives. There he produced the 'Seven Years of Plenty,' the 'Triumph of Religion,' the frescoes illustrating the 'Divine Comedy' in the Villa Massini; and the altar-piece 'Queen of Heaven' in the Trinità de' Monti. From 1830-43 he was director of the Städel Institut at Frankfurt. Some of his large frescoes in churches won him great reputation. He published 'Zehn Vorträge über Kunst' (1891).

Vela, vā'lā, Vincenzo, Italian sculptor: b. Ligonetto, Tessin, 1822; d. there 3 Oct. 1891. He was stonemason's apprentice at the building of the bridge of Viggio, and after studying under the sculptor Cacciatori in Milan went to Rome (1870) and began the model for a statue of Spartacus, now in a private collection at Saint Petersburg. He later on took up his residence at Turin where he executed a series of works comprising a wide range of ideal and monumental subjects. His principal works are: 'Hope and Resignation,' a statue for the tomb of the Donizetti family in Bergamo; a statue of 'Grief' for the tomb of the Ciani family in Lugano; 'William Tell,' a fountain statue for the same place; a standing figure of A. Rosmini in Stresa; the kneeling figures of the queen of Sardinia, Maria Theresa, (1855) and that of

Maria Adelaide in Turin (1861); the statue of the Minister Balbi; the 'Dying Napoleon'; 'Columbus and America'; etc.

Velasco, Texas, town in Brazoria County; on the Brazos River, and on the Velasco Terminal Railroad; about five miles from the mouth of the river and 35 miles southwest of Galveston. It was laid out in 1891. It had its origin in the needs of the workers who were engaged in securing deep-water, by jetty-work, on that part of the coast, and finally this locality was selected as the shipping-point. The work was done by a private corporation and over \$1,500,000 were expended. Now (1904) large vessels load and unload at the Velasco wharves. The chief industrial establishments are ice factory, planing mill, and a machine shop. It has a grain elevator, coal and brick yards. There are extensive shipments of cotton and cotton products, grain, fruit, and coal. The town has one bank, with a capital of \$50,000. Pop. (not reported separately in 1900); (1904) est. 1,600.

Velasquez, vā-lās'kāth, Diego de, Spanish soldier, conqueror of Cuba: b. Cuéllar, Segovia 1465 (or 1458); d. Havana 1522 (or 1523). After having fought in the conquest of Granada, he went to Española with Columbus in 1493, and was there prominent in warfare with the Indians. He was appointed by Diego Columbus in 1511 to effect the conquest of Cuba. With a force of 300 he landed in Cuba toward the close of the year, and encountered little resistance except from the cacique Hatuey, who was captured and killed. He assumed independence of Diego Columbus, and directed the active campaigning through his subordinate, Panfilo de Narvaez, who had arrived with reinforcements. The island was easily conquered and the natives enslaved. Velasquez made Santiago de Cuba his capital, and founded Trinidad, Matanzas and other settlements. He was connected in 1517 with the expedition of Cordova, which, seeking slaves in the Bahamas, accidentally discovered Yucatan. He also fitted out the expedition of Cortes (q.v.) for the conquest of the Aztecs, and when Cortes asserted independence sent Narvaez to take him prisoner (1520). Cortes defeated Narvaez, and Velasquez obtained no benefit from the conquest of Mexico.

Velasquez, vā-lāth'kāth, or Velasquez, Diego Rodriguez da Silva y, Spanish painter: b. at Seville 5 June 1599; d. Madrid 6 Aug. 1660. His father was Juan Rodriguez da Silva, of a Portuguese family, and his mother a Spaniard named Geronima Velasquez. He was early educated in drawing and painting under the painter Francisco Herrera the Elder, and continued his artistic training under Francisco Pacheco, whose daughter Juana he married in 1618. For a few years he worked in Seville, producing several tavern pieces, as they are called, 'The Water-Carrier' (now at Apsley House), and the two religious pictures, 'The Adoration of the Magi' (1619), in the Prado Museum at Madrid, and 'The Adoration of the Shepherds' (also called the Nativity and the Manger), now in the National Gallery of London. In 1622 he went to Madrid and through Don Juan Fonseca, almoner to the king, was introduced to Olivarez, the king's minister. Nothing came of this visit at the time, and he

accordingly returned to Seville; but in the following year he was summoned to the court by Olivarez, and by Philip IV. was appointed court painter. He is said to have painted a portrait of Charles I., then Prince of Wales, when he was in Spain in connection with the project of the Spanish marriage, and among other portraits of this early period in Madrid are those still extant of 'Philip IV. in Hunting Costume,' the 'Young King Philip V.,' and 'Don Carlos,' younger brother of Philip IV. 'Los Borrachos' or 'The Topers' (1628), now in the Prado Museum, is one of his finest works.

In 1628 Rubens visited Madrid, and on his advice Velazquez went to Italy in 1629, where he stayed in Venice, Rome, and Naples, studying several of the great Italian masters, but his own style was little influenced. He remained in Italy for two years, and during that time he painted 'Joseph's Coat' in the Escorial Gallery; 'Vulcan's Forge' in the Prado, Madrid; and 'Views of Villa Medici' (Prado). He made a second visit to Italy, chiefly to Rome, in 1648-51, to purchase works of art for his king, and during his stay in the Italian capital he painted the portrait of 'Innocent X.' now in the Palazzo Doria. Among the chief productions of this second period, between his two visits to Italy, are some fine portraits, including 'Don Baltasar Carlos' (equestrian, 1635); 'Don Baltasar Carlos' (1642-3); 'Count of Benavente' (1635); 'Conde Duque de Olivarez' (equestrian, 1640); 'Philip IV.' and 'Isabella of Bourbon' (two equestrian, 1644), his great historical painting, 'The Surrender of Breda' (also called 'Las Lanzas,' 1647); 'The Crucifixion' (1638), and 'El Primo,' one of Philip IV.'s dwarfs, besides other pictures of the royal dwarfs and buffoons, all now in the Prado Museum. On his return from this visit to Italy he was appointed by the king Aposentador Mayor, and in this capacity it was his duty to procure lodgings for the king along the routes of his journeys. The duties of the office absorbed much of his time, and ultimately they proved to be in part the cause of his death. In 1659 he had to arrange for the marriage by proxy of Louis XIV. to the Infanta Maria Teresa on the Island of Pheasants in the Bidasoa, and the strain of the work told so seriously on his health that he died not long after his return to Madrid. His wife followed him to the grave a few days afterward.

The masterpieces of his latest period are 'Las Beninas,' showing himself painting Philip IV. and Queen Marianne in presence of the Princess Margaret, maids of honor, a master of ceremonies, dwarfs, etc. (1656), and 'Las Hilanderas' or the 'Tapestry-Weavers of Madrid.' Among notable pictures by Velazquez not already mentioned are the following: In the Prado Museum, 'Philip IV. and his Second Wife at their Fald-Stools,' full-length portrait of 'Marianne of Austria'; 'Virgin Enthroned'; 'Mars'; equestrian portraits of 'Philip III. and his Wife' painted long after their death; 'Court Jester'; 'Mercury and Argus'; 'Martinez Montañes the Sculptor'; the 'Infanta Maria Teresa'; and 'Saints Paul and Antony the Hermits'; in the National Gallery, 'Philip IV. hunting the Wild Boar'; 'The Dead Roland,' a bust of Philip IV., a full length of the same, and 'Christ at the Column'; in the

Louvre, 'Meeting of Artists,' and others; in Vienna, 'Family of Velazquez'; 'Philip IV.' and others; in Valencia Museum, his own portrait; in private British collections, 'Don Baltasar Carlos' (several); 'St. Clara'; 'Doña Juana Pacheco'; 'Stag Hunt'; 'Don Adrian Pulido Pareja' (two); 'Juan de Pareja' (two); 'Lot and his Daughters'; 'The Finding of Moses'; 'Philip IV.' (several); 'Isabel of Bourbon'; 'Olivarez'; 'Deliverance of Saint Peter'; 'Venus and Cupid'; and 'Supper at Emmaus'; and others in Berlin, Dresden, Saint Petersburg, America, etc. Velazquez must be considered one of the great painters of all time, working as he did in all branches with equal enthusiasm, strength and certainty. Without sacrificing the ideal he was a thorough-faced Realist of the Spanish kind, and was always fresh, sincere and absolutely free from mannerism or even facility. He owed something to other masters, especially Ribera, but it has been truly said that his real master was nature. His genius was so individual and unique that he had no followers and founded no school, though other painters acquired something of his technique, and he has had immense influence on the practice of painting during the last half of the 19th century. French, German and English schools are all taking him as the truest model of excellence. Ruskin has said that whatever Velazquez has done may be accepted by the student as correct. Consult: Stirling-Maxwell, 'Annals of the Artists of Spain' (1848 and separately 1855); Stowe, 'Velasquez' (1881); Curtis, 'Velasquez and Murillo' (1883); Justi, 'Velasquez and his Times' (Eng. trans. 1880); Stevenson, 'The Art of Velazquez' (1895); Armstrong, 'Life and Art of Velazquez'; Williamson, 'Velasquez.'

Velde, vĕl'dĕ, Adrian. See VAN DE VELDE.

Velde, Willem. See VAN DE VELDE.

Veletz, vā'lĕs, Colombia, a city dating from 1539, the second founded in New Granada, in the department of Santander, 100 miles north of Bogotá. It lies on the eastern slope of a spur of the Cordillera Oriental and is reached by a branch road from Maniquira on the main highway from Bogotá to Socorro. In its early years it was frequently used as a city of refuge owing to its difficulty of access. The production of fruits of different kinds, and the manufacture of preserves and candies, are the chief industries. Pop. 10,000.

Veletz-Malaga, vā'lĕth mā'lā-gā, Spain, a city in the province of Malaga, 15 miles east of the city of that name, on the Veletz. 1½ miles from the Mediterranean. It is a well-built and prosperous town, overlooked by a Moorish castle on a high rock, formerly called the "Key of Andalusia." The district is exceedingly fertile, and produces sugarcane, indigo, batatas or sweet potatoes, palms, olives, oranges, and other fruits. Pop. (1900) 23,492.

Vel'iger. See LARVA; MOLLUSCA.

Vellore, vĕl-lōr', India, a town and fort in North Arcot, Madras, 80 miles southwest of Madras city. A large pagoda, with some remarkable sculptures, is the only notable edifice. The fort is of considerable extent, but is completely commanded by the adjoining hills.

VELLUM—VELVET GRASS

Within are a great pagoda, now used as an arsenal; the hospital, the barracks, magazine, and quarters for staff-officers. An American mission and college are established at Vellore. In a revolt of the native troops here on 10 July 1806, over 100 Europeans were massacred. Pop. (1901) 43,537.

Vellum, a material for writing and for bookbinding, resembling fine parchment. It is made of calf and kid skin, extended and drawn to a proper thinness when green. Parchment is made of sheep-skins in like manner. See **PARCHMENT**.

Velocimeter (Lat. *velox* (*veloc-*), swift, and Gr. *μέτρον*, measure), a name applied to various devices for measuring velocity, or speed, including the speed-gauge and speed-recorder for machinery. Specifically, it is used of an electric apparatus for measuring the initial speed of projectiles. Invented by Sir Charles Wheatstone (q.v.), it was improved by Col. J. G. Benton, U. S. A. Several more complex forms have been invented, and a simplified one by Captain Le Boulengé, a Belgian, found extensive use.

Velocipede, a light carriage consisting of a simple frame-work, supported on two or three wheels, and which is driven by the feet acting on cranks attached to the axle of one or two wheels. See **BICYCLE**.

Velocity. See **MECHANICS**.

Velocity of Electricity, the rate at which electricity is propagated through a conductor. The velocity of electricity through a conducting wire is in all cases very great when compared with the velocities of moving bodies, such as the velocity of a railway train or of a projectile; but the velocity of electricity, any more than the velocity of a planet, of a railway train, or of a bullet, is not a certain number of miles per second fixed for all cases; it varies for a number of causes, and to such an extent that while Wheatstone found the velocity through copper wire to be 288,000 miles per second, in the Atlantic cable of 1858 it was found to be 3,000 miles per second. Faraday showed that a submarine cable acts precisely as a leyden-jar, that the water serves as the outside coating, and that just as a leyden-jar takes time to become charged and to discharge, so a cable through which a sharp signal is sent from one end delivers the signal at the other end more or less prolonged; that is, the deflection of the receiving needle is gradual, reaching a maximum and then at the same rate coming back to rest. Sir William Thomson showed that the more delicate the receiving instrument, the more instantaneous is the first appearance of the current at the receiving end of the cable. He gives three reasons for the retardation of the electric current: (1) Charge and electrical accumulation in a conductor subjected in any way to the process of electrification. (2) Electromagnetic induction, or electromotive force, excited in a conductor by variations of electric currents either in adjacent conductors or in different parts of its own length. (3) Resistance to conduction through a solid. The first successful attempt to find the velocity of electricity was made by Wheatstone with the revolving mirror (his invention), which has been so successfully employed by Foucault to discover the velocity of light.

Velocity of Light, the rate at which light is propagated. There have been two astronomical estimates of the velocity of light and two terrestrial estimates. The satellites of Jupiter revolve regularly round the planet. When the Earth is in such a position with respect to Jupiter that there is the distance of the breadth of the Earth's orbit in addition to the distance of Jupiter's orbit from the Earth's orbit between Jupiter and the Earth (when Jupiter is in opposition), there is an irregularity of 16 minutes 26.6 seconds in the times at which they are hidden by the planet as compared with corresponding occultations when the Earth is the breadth of its orbit nearer Jupiter (when the Earth is in conjunction). Thus it takes light 16 minutes 26.6 seconds to pass across the Earth's orbit. Taking this distance as 183,000,000 miles, the velocity thus found is 185,500 miles per second nearly. The second astronomical estimate has been made by means of what is called the aberration of the fixed stars. Each star appears to describe a small orbit in the course of a year about its true place. The motion of the earth in its orbit carries the spectator at one time so as to increase the relative velocity of the light from the star, and at another so as to diminish this velocity. In this way it has been computed that the velocity of light is about 10,000 times the velocity of the earth in its orbit, that is, about 185,000 miles per second. Roemer, a Danish astronomer, invented the first of these methods, and Bradley, an English astronomer, invented the second. The two experimental estimates were made, the first by Fizeau, and the second by Foucault. See also **LIGHT**.

Veloxite, a smokeless explosive powder invented by William Hope in 1903. It contains no nitro compound, sulphur, phosphorus, chlorate, in fact no dangerous ingredients. The flashing point of black powder is at 640 degrees Fahrenheit, that of cordite and all nitro powders is only from 360 to 370 degrees, while that of veloxite is about 12,000. Veloxite stands the hammering of a sledge hammer on an anvil. The ingredients are stable and therefore the powder is stable. The setting up of chemical action is impossible in any length of time and in any variations of climatic conditions. Veloxite can be made in the morning and fired in the afternoon, not requiring, as other powders do, several weeks to manufacture. It can be made cheaply, its ingredients can be purchased in unlimited quantities by the ton and it is available for small arms as well as artillery.

Velvet, a textile made of silk and covered with a close, short, fine, soft shag, the other side being a very strong close tissue. The nap or shag, called also the velveting of this stuff, is formed of part of the threads of the warp, which the workman puts on a long, narrow-channeled ruler or needle, which he afterward cuts by drawing a sharp steel tool along the channel of the needle to the ends of the warp. Florence and Genoa were long noted for the manufacture of velvet, but Lyons, in France, is its principal seat; Krefeld and Elberfeld are the chief seats of velvet-making in Germany. Cotton and woolen fabrics woven in this manner are called velveteen and plush respectively.

Venable, vèn'a-bl, **William Henry**, American author and educator: b. Warren County, Ohio, 29 April 1836. He began to teach at 17, and was professor of natural sciences in the Chickering Institute, Cincinnati, 1862-8; and principal and proprietor of the same 1881-6. He was professor of English literature in the Hughes High School 1889-95, and has held a similar post in the Walnut Hills High School, Cincinnati, since the last named year. Among his numerous works are: 'A History of the United States' (1872); 'June on the Miami and Other Poems' (1872); 'The Teacher's Dream' (1881); 'Beginnings of Literary Culture in the Ohio Valley' (1891); 'Let Him First be a Man' (1894); 'Dream of Empire, or the House of Blennerhassett' (1901).

Vena'tion (Lat. *vena*, vein), in botany, the arrangement of the bundles of fibro-vascular tissue (commonly called "veins") in leaves. These bundles are parts of a framework for the support of the cellular tissue. They are of importance in determining the general characteristics of the leaf, and are employed as a basis for classification. Botanists recognize two leading kinds of venation, parallel and netted (reticular). See **LEAVES**.

Ven'dace, also **Vendis** (*Coregonus vandesius*), a variety of the *Coregonus* (q.v.), of restricted distribution, being found in only the lakes and rivers of Sweden, the Castle Loch, Lochmahen, Dumfriesshire, Scotland, and two or three English lakes. It attains an average length of from 6 to 8 inches. It is considered a delicacy, and is taken with the sweep-net.

Vendée, vôn-dā, France, a western maritime department formed from ancient Poitou, and deriving its name from the river Vendée. It is bounded on the north by the departments of the Loire-Inférieure and Maine-et-Loire; on the east by the department of Deux-Sèvres; on the south by that of Charente-Inférieure; and on the southwest and west by the Bay of Biscay; area, 2,692 square miles. The surface is much diversified, and is divided into three distinct parts: the *Bocage* (Thicket), on the north and northeast, a hilly and wooded district forming about one half of the department; the *Plaine*, a tongue of land included between the Bocage and the southern limit of the department, a bare arid tract sloping down toward the sea; and the *Marais*, including all the south and west coasts, where salt marshes prevail. In the north the department is watered by tributaries of the Loire, especially the Sèvre-Nantaise, and in the south by the Lay (with the Yon) and tributaries of the Sèvre-Niortaise. Besides grain, which more than suffices for the home consumption, the principal crops are flax and hemp; a considerable quantity of an indifferent white wine is also produced. For administrative purposes Vendée is divided into three arrondissements — La Roche-sur-Yon, Fontenay-le-Comte, and Sables d'Olonne, which are subdivided into 30 cantons and 299 communes; capital, La Roche-sur-Yon. The inhabitants, particularly those of the Bocage, are remarkable for the simplicity of their manners, and their attachment to old usages, to the nobility of the district, and to the clergy. Inspired by such leaders as La Roche-

jacquelein, Cathelineau, Charette, and Sofflet, and aided by the hilly and wooded nature of the ground, they carried on from 1793 to 1796 a war in the royalist cause, which endangered the existence of the republic. The first severe check they met with was at Savenay, 24 Dec. 1793, where their forces were broken up, and the survivors and their families were dragged to Nantes and drowned in masses by Carrier. In the following year a fresh outbreak took place, and the Vendéans were joined by the Chouans, but after some fighting they were pacified by the government granting an amnesty, freedom from military service, the free exercise of their religion, and an indemnification for their losses. The landing of some thousands of émigrés at Quiberon encouraged them to resume their arms, but the rising was completely quelled by the activity of General Hoche, who treated the Vendéans, however, with great mildness. In the winter of 1799-1800, and again in 1814 and 1815, some risings took place in favor of the Bourbons, but they were quickly suppressed by prudent and vigorous measures. See **CATHELINEAU**, **CHOUANS**, and **LA ROCHEJACQUELEIN**. Pop. (1901) 439,637.

Vendémiaire, vôn-dā-mē-ār, the first month in the French Revolution calendar, from 22 September to 21 October. Memorable in the history of the Revolution is the 13th Vendémiaire of the year IV. (5 Oct. 1795), when the Paris Sections, worked upon by royalist reactionaries, rose in insurrection against the National Convention, but were crushed by Napoleon Bonaparte, then a young artillery officer.

Vendet'ta, an Italian name for a blood feud; the practice of the nearest of kin executing vengeance on the murderer of a relative. In Corsica the vendetta is regarded as a duty incumbent on the relatives of the murdered man, and, failing to reach the real murderer, they take vengeance on his relatives. The practice exists, although to a more limited extent, in Sicily, Sardinia, and Calabria, as well as among the Druses, Circassians, Arabs, etc. In New Orleans, in 1890, the vendetta showed itself in strange juxtaposition to the law in the murder of the chief of police who had been instrumental in bringing to light some of the organized murders of the Mafia (q.v.).

Vendôme, vôn-dôm, **Louis Joseph**, **Duc de**, French general: b. Paris 4 July 1654; d. Vinaz, Catalonia, Spain, 15 June 1712. He received, in 1702, the command of the French army in the war of the Spanish Succession. After having distinguished himself in Italy, Tyrol, and Belgium, the Duke of Burgundy was placed over him, and the disagreement of the two commanders caused the defeat of the French at Oudenarde (11 July 1708). Through the influence of Madame de Maintenon Vendôme was recalled; but when the cause of Philip V. in Spain began to decline the Spaniards requested Louis XIV. to send them Vendôme. On 9 Dec. 1710, he defeated the Austrian general Starhemberg at Villa-Viciosa, and having re-established Philip's throne soon after died and was buried in the Escorial.

Veneer', a thin sheet of wood or other material used as a sort of plating to give a handsome exterior finish to articles of cabinet or other work, which are made of a ground-

VENER—VENEZUELA

work of cheaper and it may be of stronger materials. The art of veneering is not of modern invention, but according to Pliny was introduced about his time, and was used for reducing the cost of the enormously expensive tables of rare woods which were much sought after by the wealthy Romans.

Vener, vā'nēr, Sweden. See **WENER**.

Vene'real Disease. See **GONORRHOEA**; **SYPHILIS**.

Venesec'tion, Bloodletting, or Phlebotomy, the opening of a vein for the purpose of bleeding. Among the ancients great importance was attached to the place where the opening was to be made. At the present day when the operation is performed, which is but seldom, one of the superficial veins just at the bend of the elbow is usually selected. The operation itself was anciently performed with a spring lancet, but is now usually done with a simple lancet. Of the arteries, that of the temples is the only one which is opened, and that is done in cases of local complaints of the head. Another mode of letting blood is by cupping, or by the application of leeches for the purpose of extracting blood from places affected by inflammations. The schools of the empirics (250 B.C.), relying, like Hippocrates, on their own experience and on the observation of nature, endeavored to determine the cases in which bleeding was indispensable. But medicine declined with the general decline of science. Greek physicians indeed still distinguished themselves among the Romans, but the sect of empirics had degenerated. Excessive bleeding again became common, until Asclepiades of Bithynia (Cicero's physician and friend) taught a new method of venesection. He considered the cause of the greatest number of diseases to be redundancy of blood, and on this account advocated the practice of bleeding, but principally for the alleviation of pain, and applied this remedy frequently in case of local affections. After him Celsus gave an account of the cases in which bleeding was necessary (5 A.D.), and his remarks and directions correspond exactly with those of the greatest modern practitioners. Aretæus, founder of a new school (70 A.D.), prescribed bleeding more frequently in acute than in chronic diseases, and in extreme cases he bled the patient to complete exhaustion. Galen (160), who referred the origin of a large class of diseases to excess of blood, ordered copious bleedings; and this practice gained great repute, and prevailed for several centuries. After the fall of the Roman Empire physicians were so scarce in Europe that Charlemagne is said to have died of an inflammation of the lungs, for want of medical attendance. The Arabian physicians followed the authority of Galen, and spread his doctrine over Spain, Italy, and France. Bleeding was still more generally practised by the monks, who were in the sole possession of medicine as well as of all other science in those ages. At a later period astrology was connected with the medical art, and bleedings were prescribed on certain days. The popes, indeed, had often forbidden the monks to practise medicine; but they either disregarded the orders, or considered them as referring only to surgical operations. Thus surgery began to be separated from medicine, and formed a new

profession, including the art of bleeding, applying leeches, and shaving. But when, after the invention of printing, the writings of the physicians of Greece, especially of Hippocrates, began to circulate and their doctrines to revive, the practice of bleeding, at least among physicians, was again confined to certain cases. In Germany Paracelsus (1525) overturned the system of Galen, and with it the practice of bleeding, which was now confined to the surgeons and barbers alone. In France, Italy, etc., the method of Hippocrates and the degenerated system of Galen were, however, not yet abandoned, and the practice of bleeding was carried to the greatest excess. Helmont (1600), founder of a new system, doubted the use of extracting blood, alleging against it that it weakened too much the vital spirit, which he called *archæus*. Harvey's discovery of the circulation of the blood (1619) had some influence on the modes of venesection, in as far as it led to experiments (1642) by which medicines were infused immediately into the veins, or a portion of the infected blood extracted, and supplied by the blood of healthy men or animals. In England Sydenham rose (1673), who thought it possible to expel diseases by copious bleedings. He extracted blood in almost all cases, never less than 8 ounces, generally 10 or more, and in cases of inflammation as much as 40 ounces. The pernicious consequences of this practice did not escape him, but he thought he could not subdue disease by any other means. Stahl (1707) attempted to unite the system of Hippocrates with that of Helmont, and advocated the more moderate practice of bleeding. He taught that abundance of blood was no disease, but might become so by a disproportion created between the solid and fluid parts of the system, in which case the proper balance ought to be restored. But he found bleeding indispensable in cases of too great excitement succeeded by a congestion or effusion of blood. To prevent this he prescribed occasional bleeding. His method was soon misunderstood and misapplied. The extraction of blood for the preservation of health was everywhere thought necessary. Borden endeavored to stop this abuse in France. Cullen (1777), who regarded all diseases as proceeding from an unnatural state of the nerves; all irregularities of the fluids as the consequences of weakness and spasm, recommended bleeding as the best means to diminish the activity of the whole body, and especially of the system of the blood-vessels. He recommended, however, a due regard to circumstances, and mainly adopted Stahl's doctrine of the superabundance of blood. Stoll of Vienna (1780), an admirer of Sydenham, resorted frequently to bleeding. Several of the later physicians sought, however, to limit its too frequent application. Wollstein (1791) recommended it only in a few cases. Gall also improved the system still more. Brown adhered to the same maxim, and greatly limited the practice. At present the belief is gradually growing that the practice might in some cases be employed with great advantage.

Venezuela, vën-ë-zwě'la, Sp. vā-nāth-wā'lā, a republic lying in the northern portion of South America, bounded on the north by the Caribbean Sea; on the west by the Republic of Colombia; on the south by Brazil; and on the east by British Guiana; lat. 1° 40' to 12° 26' N.,

VENEZUELA

lon. 59° 54' to 73° 17' W. The republic is composed of 13 states, one federal district and four federal territories. The names of the states are as follows: Aragua, Bermudez, Bolivar, Carabobo, Falcón, Guárico, Lara, Mérida, Miranda, Táchira, Trujillo, Zamora, and Zulia. The area of the country claimed and occupied by Venezuela is 593,943 square miles; pop. (1891) 2,323,527. The capital is Caracas; pop. 80,000.

Topography.—The coast line, extending from east to west, from the delta of the Orinoco to the boundary of the Republic of Colombia, is 1,584 miles in length. Venezuela comprises the plains of the Orinoco basin, in continuation of the Amazon Valley around the mountains of Guiana, partly separated from the Caribbean Sea by the northeast range of the Andes. These plains are traversed by many rivers, the main river being the Orinoco, into which flow the Caroní and Ventuari, traversing and draining with their affluents the Guiana Mountains, the Atabapo, and other rivers. The Upper Orinoco is connected with the Upper Amazon by the channels of the Cassiquiare and the Rio Negro. The mountain system of the Andes extends north and east into Venezuela from Colombia. Between the north and east ranges is the low country of Lake Maracaibo basin. The country east of this basin is an extensive mountain tract, some of the peaks reaching above the limit of perpetual snow. These mountains extend along the north coast, in a double range, having fertile valleys between. There are other mountains ranges in the south and east. The highest peak is the Sierra Nevada de Mérida, reaching a height of 15,400 feet. Lake Maracaibo, in the extreme northwest, has an area of 8,392 square miles, and is connected by an outlet, eight miles wide, with a gulf of the same name; the waters of the gulf and lake together forming an inland waterway that penetrates the country more than 300 miles.

Climate.—The climate is tropical, and very hot in the valleys, the regions of the Lower Maracaibo basin being the hottest found on the western continent. Above an altitude of 2,000 feet the climate becomes temperate, and cold above 7,000 feet. Much of the mountainous and plateau country has an elevation between these altitudes. The mean temperature at La Guayra is 82°, at Caracas 77°, but at Mérida 61°. Wet and dry seasons alternate on the table-lands. Rain is abundant in the mountain regions.

Zoology.—Large regions of Venezuela, especially in the southwest, comprising the Upper Orinoco basin and plains, are still unexplored, much of the country being densely covered with forests, penetrable only with great difficulty. Fully one half of Venezuela is unbroken forest. These forests abound in wild animals, insects, birds, and reptiles. There are many species of monkeys, all the varieties of South American felidæ, tapirs, deer, ant-eaters, the spectacled bear, the cabaiai sloths, etc. Aquatic birds in enormous flocks are found in the swamps, lakes, and rivers. Tortoises are plentiful, 50,000,000 eggs annually being taken for their oil. Manatees and porpoises ascend the Orinoco. The rivers, bays, and lakes abound in fish of many varieties.

Agriculture.—Agriculture is the principal industry, but is mostly confined to the northern mountainous belt, where the greater part of the population is concentrated. The principal prod-

ucts are coffee, cacao, sugar-cane, tobacco, maize, cotton, and tropical fruits. Wheat is cultivated in some of the higher plains. Indigenous products, cultivated or gathered, include the tonka bean, rubber, copal, sarsaparilla, cinchona, many beautiful cabinet woods, dye woods, herbs, drugs, etc. The agricultural lands amount to about 135,000 square miles. Great herds of sheep, goats, and cattle are raised on the table-lands and mountain slopes, the export of hides and skins forming an important industry of the country.

Mineralogy.—Venezuela has a great many gold mines. The El Callao mine has had a maximum annual yield of over \$3,000,000. Copper, coal, salt, asphalt, silver, lead, tin, iron, sulphur, and petroleum are also found. Guano is exported and bitumen is found in the river deltas and lake basins.

Commerce.—In 1898 the imports amounted in value to \$8,560,840 and the exports in the preceding year aggregated \$14,900,000. In 1898 the United States imported from Venezuela commodities to the value of \$7,722,564 and exported thereto various articles aggregating \$2,704,908. Among the United States imports was coffee to the value of \$6,171,043. Coffee constitutes about three fourths of the entire export trade and nearly six sevenths of the import trade is subject to duty.

Finances.—The external debt of Venezuela began with its assumption of its share of the old Colombian debt of 1834, which was £2,794,826. On 31 Dec. 1903 the total of the external debt was \$30,329,084, and on the same date the total of the internal debt was \$18,596,617.

Communications.—The country has few railroads. In 1899 there were 529 miles in operation; in 1903, 4,026 miles of telegraph line with 129 telegraph offices, 12 telephone companies operating 3,242 miles of wire, and 214 post-offices. Wagon roads and mule paths connect all the interior towns with the capital. The chief channels of intercommunication are the rivers. There are regular steamboat lines up and down the Orinoco and a great deal of short-distance travel is accomplished by small craft. There is steam and cable communication with Europe and with the United States.

Government.—The government of Venezuela is a federative republic, having a president, elected for six years, and a Congress of two houses. The government is modeled after that of the United States.

Religion.—The state religion is Roman Catholic, but all other religions are freely tolerated. There are government universities at Caracas, Valencia, and Mérida. There are also, chiefly at Caracas, special colleges, seminaries, military schools, and normal schools, a national library, museum, and observatory.

History.—The east coast of Venezuela was discovered by Columbus in 1498; Ojeda and Vespucci followed in 1499, and, entering Lake Maracaibo, they found an Indian village constructed on piles, to prevent the evil effects of inundation, and they named the place Venezuela, or Little Venice, a name which afterward spread to the whole country. The first settlement was made at Cumana in 1520 by the Spaniards, and Venezuela remained subject to Spain till it claimed independence in 1811. It then returned to allegiance to Spain, but again

VENEZUELA — VENEZUELAN BOUNDARY DISPUTE

revolted in 1813, and, forming with New Granada and Ecuador the Republic of Colombia, was declared independent in 1819. In 1830 Venezuela withdrew from the other members of the Free State founded by Simon Bolivar and declared itself a federal republic. The charters of fundamental laws date from 1830, were amended in 1864 and 1881, and are quite similar to the Constitution of the United States of America, but permit more independence in local government.

The most notable events in recent years were the boundary dispute with Great Britain, settled by arbitration in 1899; the local disturbances and controversy with Colombia in 1901-2 (see *COLOMBIA; VENEZUELAN BOUNDARY DISPUTE*); and the blockade of Venezuelan ports by several European powers to enforce the payment of certain claims. In the latter part of 1902 and the beginning of 1903 Venezuela's ports were blockaded by the allied powers England, Germany, and Italy, which took this method to enforce certain claims, some of their subjects alleged to hold against Venezuela. Before such demonstration of force, the Venezuelan government desirous to prevent further complications and to adjust any differences that might exist in regard to the claims, selected the Hon. Herbert W. Bowen, Envoy Extraordinary and Minister Plenipotentiary, of the United States in Venezuela, to act as its representative in order to negotiate with the blockading powers the final settlement of this vexatious question. After a long and spirited debate, certain protocols were signed on 13 Feb. 1903 and the blockade raised. According to the protocols Venezuela agreed to pay a small amount in cash and submit the bulk of the claims to a mixed commission for adjustment. While the negotiations were being conducted by Venezuela's representative, the important question of preferent rights arose among the claimants, in other words, who should be paid first, whether such powers as had made a display of force or the other creditor powers which had peacefully negotiated the settlement of their respective claims. The question was submitted to the tribunal of The Hague as an arbitrator, and this court decided in favor of the blockading powers.

AUGUSTO F. PULIDO,

First Secretary of the Venezuelan Legation.

Venezuela, Gulf of, or Maracaibo, Gulf of, in the northwest of Venezuela, extends between the peninsulas of Goajira and Paraguana, with a maximum width east to west of 165 miles, and a length of 50 miles from its opening on the Caribbean Sea to the narrow inlet communicating with Lake Maracaibo (q.v.).

Venezuelan Boundary Dispute. In 1885 a crisis arose between Great Britain and Venezuela regarding the boundary line separating the latter country from British Guiana, a question which had been long in dispute. The controversy dated back to 1814, when Great Britain acquired by treaty with the Netherlands the provinces of Demerara, Essequibo, and Bernice. Venezuela originally claimed her limits to be those of the captaincy-general of 1810, but contented herself with claiming the line of the Essequibo River as the true boundary. Great Britain apparently acquiesced till 1840, when she commissioned Sir R. Schomburgk to lay out the boundaries, which he proceeded to do by

including a large area which had before been considered by Venezuela a portion of her domain, and to the possession of which by Great Britain a vigorous protest was entered. After much diplomatic negotiation the monuments set up by Schomburgk were removed by the order of Lord Aberdeen. Other boundaries were from time to time suggested, but none agreed on, till finally, in 1886, Great Britain returned to her contention of 1840, and claimed all the territory within the Schomburgk line. The controversy continued till 1894, when a Venezuelan force entered the disputed territory and raised the flag of the latter country at Yuruan. The following year the British police removed the flag, for which they were arrested, but finally released, Great Britain setting up a demand for reparation somewhat in the nature of an ultimatum.

The United States became a party to the dispute by the act of Congress directing the President to urge Great Britain to submit to arbitration the question whether Venezuela was entitled to the territory between the Essequibo and the Orinoco. In his annual message to Congress, 3 Dec. 1895, President Cleveland called attention to the boundary controversy and the representations made by the United States government to that of Great Britain with a view of securing the submission of the dispute to arbitration. On the 17th he sent a special message to Congress accompanied by the answer of the British government to the representations mentioned, and a recommendation that Congress authorize the appointment of a commission to determine the divisional line between Venezuela and British Guiana. The message created intense excitement throughout Europe and America. Both Houses of Congress passed a commission bill unanimously and indulged in much talk of war. Under the bill the President announced, 1 Jan. 1896, the appointment of the following commissioners: David J. Brewer, Associate Justice of the United States Supreme Court; Richard H. Alvey, Chief Justice of the Court of Appeals of the District of Columbia; Andrew D. White, ex-United States Minister to Russia; Frederick R. Conder, and Daniel C. Gilman, president of Johns Hopkins University. Subsequently the commission organized and chose Justice Brewer its president.

The commission invited the governments of Venezuela and Great Britain to formulate and present to it their respective cases in support of their claims. The invitation was complied with by both governments. Independently of these cases the commission gathered a great mass of evidence bearing on the claims, and continued its sittings till 27 Feb. 1897, when, Venezuela and Great Britain having signed a treaty providing for the submission of the claims to arbitration, the commission considered its work at an end, made its report to the President, and terminated its existence. The treaty between Venezuela and Great Britain was signed in Washington, D. C., on 2 Feb. 1897, and provided for the appointment of an arbitration tribunal to determine the boundary line, consisting of five jurists, the two on the part of Venezuela being Chief Justice Fuller and Associate Justice Brewer, of the United States Supreme Court; the two on the part of Great Britain being the Rt. Hon. Baron Herschell and the Hon. Sir Richard Henn Collins; and the fifth to be selected by the four jurists nominated in the

VENI CREATOR SPIRITUS — VENICE

treaty, or, in the event of their failure to agree, by the king of Norway and Sweden, the fifth jurist to be the president of the tribunal. The treaty provided that the tribunal should sit in Paris, France. The tribunal was completed by the selection of Professor Martens, a distinguished Russian jurist, professor of international law in the University of St. Petersburg, and legal writer, as the fifth member and president. The award of the tribunal, which was delivered 3 Oct. 1899, gave Great Britain the Schomburgk line, with the exception of Barima Point, at the mouth of the Orinoco, and a strip of territory between the Wenamu and Cuyuni rivers; but it was decided that the mouth of the Orinoco should be open to the British and both banks of a part of the Cuyuni where the Schomburgk line had given them only one bank.

AUGUSTO F. PULIDO,

First Secretary of the Venezuelan Legation.

Veni Creator Spiritus, vě'nī krē-ā'tōr spīr'-ī-tūs, the first words of a certain well-known Latin hymn, which are employed as its title. The hymn is addressed to the Holy Spirit, is sung in ordination offices of the Anglican Church and at Whitsuntide, and formerly at the celebration of the Holy Communion. Saint Ambrose 350 A.D. is supposed by some authors to have written it. The first English version added to the Prayer Book in 1662 has been attributed to John Dryden. The full text of the original hymn is as follows:

Veni Creator Spiritus
Mentes tuorum visita;
Imple superna gratia
Quæ tu creasti pectora.

Qui Paraclitus diceris
Donum Dei altissimi;
Fons vivus, ignis, caritas,
Et spiritalis unctio.

Tu septiformis munere
Dextre Dei tu digitus;
Tu rite promissum Patris
Sermonem ditans guttura.

Accende lumen sensibus
Infunde amorem cordibus;
Infirma nostri corporis
Virtute firmans perpetim.

Hostem repellas longius
Pacemque dones protinus;
Ductore sic te prævio
Vitemus omne noxium.

Per te sciamus de Patrem
Noscamus atque Filium;
Te utriusque Spiritum
Credamus omni tempore.

Sit laus Patri cum Filio
Sancto simul Paraclito;
Nobisque mittat Filius
Charisma Sancti Spiritus. Amen.

Venial Sin (O. F. *venial*, from Lat. *venialis*, pardonable), in Roman Catholic theology, a term used to signify the lesser transgressions of the law of God or of the Church, in contradistinction to mortal sin, which means spiritual death, deserves eternal punishment, and demands Divine power for renewal. In the case of venial sin, "grace is still left by which the sin may be repaired."

Venice, vě'nīs (Italian *Venezia*, German *Venedig*), northern Italy, a seaport city and capital of a province in the compartment or division of Venetia, situated on about 120 islands in a lagoon or shallow bay of the Adriatic Sea (Gulf of Venice), north of the mouths of the Adige

and Po, 150 miles east of Milan and 70 miles west-southwest of Trieste. The city has a compact, roughly elliptical form, the greater number of the islands being close together and separated only by narrow canals (*rii*), about 175 in number, over which 378 bridges have been constructed. The city is about two and a half miles from the mainland, with which it is connected by a railway bridge of 222 arches. On the sea side, separating the lagoon from the open sea, are long narrow stretches of sand-hills, known as *lidi*, strengthened in places by masonry bulwarks. Both the *lidi* and the coast behind the town are defended by strong forts. Besides the canals, which to a large extent take the place of streets in Venice, there are numerous narrow lanes (*calli*) between the houses. The broadest street is the Corso Vittorio Emanuele in the north, and the most important business street is the Merceria, lined by handsome shops, which opens into the Piazza San Marco. The buildings are mostly erected on piles. The main part of the city is traversed by the Grand Canal, about two miles long and from 33 to 66 yards in width, which proceeds from the southeast to the railway-station in the northwest by a winding course, somewhat like a letter S. It is lined along its whole length on both banks by a series of splendid palaces and houses. It is crossed by the famous Rialto bridge, in the centre of the city, built in 1588-91 and consisting of a single marble arch, and by two iron bridges. The tramways and cabs of other towns are represented in Venice by gondolas, barcas, steam launches and the steamers of the Società Veneta Lagunare, which ply on the canals. The chief square is the Piazza San Marco (Saint Mark is the patron saint of Venice) on the southeast, continued by the smaller Piazzetta to the bank of the Canale di San Marco, and lined by some of the chief buildings of the city. It is the fashionable promenade of the Venetians and the centre of the city's life. Of islands not forming part of the main mass of the city the chief are Giudecca, on the south, separated from Venice proper by the Canal della Giudecca; Isola di San Giorgio Maggiore, immediately east of the former, and separated from Venice by the broad Canale di San Marco; Isola di San Pietro, east of the main group of islands; Murano, a mile and a half to the north, with an ancient glass industry; Cemetery Island, to the northeast; Burano, to the northeast, with lace-factories; Torcello, to the northeast, with an interesting cathedral; San Lazzaro, to the southeast, with an Armenian Mechitarist monastery; and San Servolo, to the southeast, with the lunatic asylum of the province. Of the sand-banks or *lidi* already mentioned the Lido di Malamocco fronting the city across the lagoon is a very popular well-equipped resort largely patronized during the bathing season.

Churches.—The great church of Venice is the cathedral of Saint Mark, on the east side of the square of the same name. It was begun in 830 as a brick basilica in Romanesque style and was rebuilt after a fire in 976. It was elaborately decorated and transformed into a Byzantine building in the succeeding two or three centuries, and in the 15th century Gothic elements were added. In its present form it is a Greek cross surmounted by a dome at the end of each arm and one in the centre, and it contains about

THE CATHEDRAL OF SAINT MARK

VENICE

500 columns, mostly in Oriental style, with richly ornamented capitals. The interior is adorned with a great profusion of splendid mosaics and also by other artistic productions of great beauty, such as the bronze monument of Cardinal Zeno and the Pala d'Oro, an altar-piece exquisitely worked with jewels on plates of gold and silver. Near the cathedral stood till its fall in 1902 the square Campanile, or bell-tower, 322 feet in height, with fine bronze statues and gates, and here is the clock-tower, with two bronze giants for striking the hours. The Campanile is being rebuilt. Among other churches are the following: Saints Giovanni e Paolo, a splendid Gothic domed building erected in 1340-1430, containing the burial-vaults of the doges and many magnificent monuments; San Maria Glorioso dei Frari, a beautiful cruciform structure in Italian-Gothic style, erected in 1250-1338, containing some splendid monuments and several of the finest works of Titian and Giovanni Bellini; San Salvatore, completed in 1534 (façade later) and recently restored, containing Titian's Annunciation; Madonna dell' Orto, with a beautiful façade in late Gothic style, and containing many fine pictures by Tintoretto and others; San Zaccaria, built in 1457-1515 in the style of the Gothic-Renaissance transition, with fine pictures; San Maria Formosa, an early cruciform church, often rebuilt, with good pictures by Palma Vecchio and others; San Maria dei Miracoli, erected in the style of the Early Renaissance in 1481 (restored), adorned with marble outside and beautifully decorated in the interior; San Giacomo di Rialto, the oldest church of the city, now closed; San Rocco (1490, restored 1725), containing many of Tintoretto's works; San Sebastiano (1506-18; restored), containing the tomb of Paolo Veronese and fine paintings by him; San Maria della Salute, erected in 1631-2 in memory of the plague, including works by Titian and others; San Giorgio Maggiore, on the island of the same name, begun by Palladio in 1560, with a very beautiful interior; Il Redentore, on the Giudecca, erected by Palladio in 1576; San Giovanni Crisostomo, in Renaissance style, containing fine paintings by Giovanni Bellini and Sebastiano del Piombo; San Marciliano, notable for works by Titian and Tintoretto; San Caterina, with a splendid altar-piece by Paolo Veronese; the Jesuits' church, in baroque style (1715-30), and splendidly decorated, with a fine altar-piece by Titian; San Giorgio degli Schiavoni, with Renaissance façade, and containing fine paintings by Carpaccio; San Pietro di Castello, on San Pietro island, the cathedral of the city till 1807; San Giovanni Elemosinario (1527), containing a splendid altar-piece by Titian; etc. There are also churches for Anglicans, Scottish Presbyterians, Waldensians, German Protestants, Greek Catholics, Armenians, Jews, an Italian Free Church, etc.

Palaces.—The Procuratie Vecchie, so called because the procurators of the republic formerly dwelt in them, is an imposing group of buildings on the north side of the Piazza San Marco, and directly opposite them are the Procuratie Nuove, which together with the magnificent library building now form the royal palace. The Procuratie Vecchie were built in 1496-1520, and the Procuratie Nuove were begun in 1584. The library was begun by Sansovino in 1536 and is

one of the finest non-ecclesiastical buildings in Italy. Its interior is adorned with ceiling and wall paintings by Paolo Veronese, Tintoretto, Schiavone, and others. Facing the old Library, on the opposite (eastern) side of the Piazzetta, stands the Palazzo Ducale or Palace of the Doges, which was first erected in 800 and has been rebuilt in styles of ever-increasing grandeur after five destructions. The exterior consists of two arcades, one above the other, and is adorned with colored marbles. It was restored in 1873-89. The Porta della Carta, a portal next to the cathedral, the incomplete court, and the flight of steps (Scala dei Giganti) leading up to the palace deserve special mention. The interior is very fine and contains a splendid collection of works by Tintoretto, Paolo Veronese, and other great Venetian masters, including the 'Paradise' of the first named, which is the largest oil-painting in the world. The building also includes the Library of Saint Mark, with its many manuscript and other treasures, and an archaeological museum. The famous Bridge of Sighs (Ponte dei Sospiri) leads from the Palace to the Prigioni Criminali, or prison for ordinary criminals, built in 1512-97 and still in use. The palaces along the banks of the Grand Canal are of all styles from Romanesque to Late Renaissance, among them being the following: Palazzo Corner della Cà Grande (1532), now the seat of the prefecture; Palazzo Grimani (in Renaissance), a very fine building, now containing the Court of Appeal; Palazzo Farsetti and Palazzo Loredan (Romanesque), both now used by the municipal authorities; Palazzo Rezzonico (17-18th century), in which Robert Browning died; Palazzo Foscari (Gothic), now containing a higher commercial school; Palazzo Cappello-Layard, the former residence of Sir H. A. Layard; Palazzo Bernardo, said to be the oldest building of the city, now a mosaic factory; Fondaco de' Tedeschi, a German warehouse from the beginning of the 13th century, now the chief post and revenue office; Palazzo Cà Doro (Gothic), now the French consulate; Palazzo Vendramin Calergi (Early Renaissance), one of the finest of all, the place where Wagner died; Paul de' Camerlenghi (Early Renaissance), the former residence of the treasures of the republic; and the Fondaco de' Turchi (Romanesque), once a Turkish warehouse, now containing the municipal museum.

Monuments.—These include: in the Piazza San Marco, the pedestals of the flag-staffs (1505) and the marble sarcophagus, supported by lions, of Daniele Manin, the head of the short-lived republic of 1848; in the Riva degli Schiavoni, a marble-paved quay along the north bank of Saint Mark's Canal, an equestrian statue of Victor Emmanuel II. (1887); in the Campo San Bartolommeo, a bronze statue of Carlo Goldoni (1883); in the Campo San Fosca, a bronze statue of Fra Paolo Sarpi (1892); beside the church of Saints Giovanni e Paolo, an equestrian statue of Bartolommeo Colleoni, modeled by A. Verrocchio (d. 1488) and cast in bronze by A. Leopardo, on a marble pedestal designed by the latter (1490-5), considered by Riskin the finest work of sculpture in the world; south of the arsenal, Venenuti's monument (1885) in commemoration of the service of the soldiers in the inundation of 1882; a bronze monument to Garibaldi (1887) at the

VENICE

entrance to the public gardens; and a marble statue of Niccolò Tommaseo (1882) in the Campo Francesco Morosini.

Educational Institutions, Collections, Gardens, etc.—The Accademia di Belle Arti, at the southern end of the older iron bridge over the Grand Canal, contains a priceless collection of paintings by Venetian masters, including Titian (his masterpiece is here), Paolo Veronese, Giovanni and Gentile Bellini, Palma Vecchio, Rocco Marconi, Pordenone, Cima da Conegliano, Paris Bordone, Carpaccio, Tintoretto, and Tiepolo. The Reale Istituto di Belle Arti is situated beside the academy. The Royal Institute of Sciences, Arts, and Industry occupies one of the palaces on the Grand Canal. The Museo Civico Correr, in the Fondaco de' Turchi, comprises both the former municipal and the Correr collections. The town also has lyceums and gymnasia, an Armenian educational institute, a Seminario Patriarcale, containing some sculptures and pictures, technical schools, a higher commercial school, school of industrial art, a deaf-mute school, conservatory of music, atheneum, observatories, and other similar institutions. The Giardini Pubblici, in the southeast, were laid out by Napoleon in 1807 on the site of monasteries which he caused to be demolished; other gardens are the Giardino Reale, behind the royal palace, and the Giardino Papadopoli, at the northern end of the Grand Canal. The chief theatre of the town is La Fenice.

Public and Commercial Buildings, etc.—Among these are: the archives building, besides the Frari church, containing about 14,000,000 documents from 883 downward; the Zecca or mint (1536), besides the royal palace; the customs-house, at the southeast end of the Grand Canal; the branch of the Banca d'Italia in the Palazzo Manin; the Monte di Pietà or pawn-office, in the Palazzo Corner della Regina; the arsenal, in the south of the city, with stocks for ship-building and large graving-docks; the chamber of commerce; telegraph office; military prison; barracks, etc. New waterworks were completed in 1890. The public hospital is a large building beside the church of Saints Giovanni e Paolo, and the city also contains a military and a naval hospital, lunatic asylums, orphanages, a home for foundlings, houses of correction, and other institutions of a like kind.

Manufactures, Trade, etc.—In addition to the glass and lace industries on the islands of Murano and Burano, there are in the city manufactures of glass and glass beads, silk-stuffs, cottons, woollens, tobacco, soap, wax, furniture, gold and silver wares, matches, artificial flowers, machinery, torpedoes, etc. Ship-building is also a growing industry. The trade of Venice, though less important than in the 15th century, has been steadily growing for many years, and is considerable, the port now ranking second to Genoa in the commercial importance of the kingdom. The number of ships which entered the port in 1900 was 3,097, with a total tonnage of 1,288,040. Vessels enter from the sea through the Porto Malamocco and the Porto Lido, and there is considerable dock and wharf accommodation in the Bacino della Stazione Marittima. Much modern improvement has been instituted in Venice, including careful sanitation, a new water supply from mainland

sources by means of an aqueduct, and an electric lighting and industrial supply, generated by the Cellina torrent near Belluno and transmitted to the city.

History.—The foundation of Venice is attributed to the inhabitants of the surrounding districts, who fled from the cruelty of Attila the Hun and took refuge among the islets off the mouth of the Brenta. Here, about the middle of the 5th century, they founded two small towns called Malamocco and Rivoalto, and devoted themselves to commerce. In 697 Pauluccio Anafesto was elected the first doge or duke. In 819 the seat of government was transferred from Malamocco to Rivoalto (Rialto), and the adjacent islands were connected by bridges. The Crusades (1096-1271) gave lucrative employment to the shipping of the Venetians, and enabled them to make large additions to their territory. In 1204 the Doge Enrico Dandolo conquered Constantinople with the aid of the French Crusaders. In consequence of this the Byzantine Empire was divided, and the coast districts of the Adriatic and the Levant, together with numerous islands, including Candia, fell to the share of Venice. Under the successors of Dandolo Genoa contrived to wrest from Venice her eastern conquests. In 1355 the Doge Marino Falieri, who plotted the overthrow of the aristocratic form of government, was beheaded. During the dogeship of Andrea Contarini (1367-82) Padua, Verona, Genoa, Hungary, and Naples leagued themselves against Venice, which, after a severe struggle, lost all its possessions on the mainland. The tide of fortune, however, soon set again in favor of the Venetians. In 1386 they captured Corfu, Durazzo, Argos, etc.; in 1405 their general, Malatesta, conquered Vicenza, Belluno, Feltre, Verona, and Padua; in 1408 they gained possession of Lepanto and Patras; and in 1409 of Guastalla, Casalmaggiore, and Brescello. In 1416 the Venetian fleet under Loredan defeated the Turkish fleet at Gallipoli, and in 1421 subjugated all the towns on the Dalmatian coast. The close of the 15th century is the culminating point in the history of Venice. It had a population of 200,000, and was the centre of the entire commerce of Europe. With the commencement of the 16th century its power began to decline. Its commerce was gradually superseded in a great measure by that of the Portuguese in consequence of the discovery of the new sea-route to India. A league to subdue the republic was formed at Cambrai in 1508 between Pope Julius II., the emperor of Germany, and the kings of France and Spain. Once again all its possessions on the mainland were taken from it. The work of destruction was all but completed by warfare with the Turks, at intervals from 1640 to 1718, during which the Morea and the islands of Cyprus and Candia were lost, and with them the ascendancy in the Levant. After the French Revolution it refused to enter into an alliance with Bonaparte, and the French took possession of the city in 1797. It subsequently became part of the Austrian empire, of Napoleon's kingdom of Italy, and of the Lombardo-Venetian kingdom under Austria, in which last it continued from 1815 to 1866. A revolution broke out in 1848, when the citizens endeavored to re-establish their ancient form of government under the presidency of Manin, but after suffering from a

VENOMOUS ANIMALS—VENTILATION

15 months' siege by the Austrians, and from internal dissension, it was compelled to capitulate. In consequence of the misfortunes of Austria in her war with Prussia in 1866 the city and province were ceded to Napoleon III., under whose auspices they were united by a plebiscite to the kingdom of Italy. The greatest names in Venetian art are those of the Lombardi (15th and 16th centuries), Jacopo Sansovino (1477-1570), Andrea Palladio (1518-80), Vincenzo Scamozzi (1552-1616), and Baldassare Longhena (1604-75) in architecture; the Massegne (about 1400), the Buon (15th century), the Rizzi (15th century), the Lombardi Alessandro Leopardi (d. 1522), and Jacopo Sansovino in sculpture; the Vivarini (15th century), Jacopo Bellini (d. 1464), Carlo Crivelli (d. 1493), Gentile Bellini (1427-1507), Giovanni Bellini (1428-1516), Vittore Carpaccio, Cima da Conegliano, Giorgione (d. 1510), Jacopo Palma Vecchio (1480-1528), Tiziano Vecelli (Titian, 1477-1575), Sebastiano del Piombo (1485-1547), Rocco Marconi, Giovanni Antonio da Pordenone (1483-1539), Paris Bordone (1500-70), Jacopo Tintoretto (1518-94), Paolo Veronese (1528-86), Palma Giovane, and Giovanni Battista Tiepolo (1693-1770) in painting. Consult: Ruskin, 'Stones of Venice'; Hazlitt, 'The Venetian Republic'; Mrs. Oliphant, 'The Makers of Venice.' Pop. (1901) 151,841.

Venomous Animals. Among the various contrivances for offense and defense found among animals the presence of a poison-apparatus, consisting of a poison-gland and an organ for introducing the poison into the body of the prey, is a noteworthy feature. In some of the lower forms of animal life, such as Coelenterata, peculiar stinging-cells, termed *nematocysts* (q.v.), are developed in the tissues. Each consists of a sac having a filament coiled up therein. On being touched the thread-cell ruptures, and the thread is everted, and enters the surface of any animal it touches with a benumbing effect. In centipedes a poison-apparatus is contained within the mouth, one pair of foot-jaws being furnished with a hooked fang which communicates with a poison-gland. Among insects, such as the bees, hornets, etc. (q.v.), the sting (see Ovipositor) consists of sharp filaments, perforated for the transmission into the wound they make of a poisonous or irritating fluid, secreted by a special gland. In the scorpions (q.v.) the poison-gland is situated in the last segment of the jointed tail, the fang being formed by the modified *telson*. Among higher animals the serpents (q.v.) constitute the chief group in which a venomous apparatus is present. In these animals certain modified teeth of the upper jaw form grooved fangs, which communicate with the poison-glands, formed by modifications of the salivary glands. (See Rattlesnakes.) The venom of serpents appears to act by altering the constitution of the blood, and by action on the blood-corpuscles preventing the due purification of the blood. It may be remarked that in all cases the venomous matter must be introduced *directly* into the circulation to produce its effects. A person may swallow the poison of a snake without experiencing any evil effects.

Ventilation. See HEATING and VENTILATION.

Ventilation, Car. Scientists agree that, for the enjoyment of health, and also for the prevention of fatal diseases, adults, on the aver-

age, absolutely require 3,000 cubic feet of fresh air per hour, and for elbow room to the extent of 300 cubic feet of space. The problem has been how to afford this on steam and electric railways particularly, and it has never been solved prior to this year of grace 1904.

This problem presents its first difficulty in the fact that in an average railway car the individual finds himself possessed of only one third the space to which the "laws of Nature and of Nature's God entitle him." Add to this that he may be going at the rate of a mile a minute; that any ordinary opening for the admission of air occasions a draft and the admission of extraneous matter; that his principal exercise is to take into his blood through his lungs the exhalations and respirations of his promiscuous fellow passengers—and you have a picture of the real dangers of modern travel. It is estimated that one in a million is your chance of accident in a Pullman car, while 25 per cent of the fatal diseases are the direct result of impure air. The absolutely essential blood purifier is pure air in an adequate supply. History records many notable instances of great mortality from the breathing of impure air, as in the case of the "Black Hole of Calcutta" (q.v.), where hundreds perished in one night because consigned to breathe over and over a limited supply of air.

The process of vitiating the atmosphere is astonishingly rapid. The healthy adult will pass through the lungs 3,000 cubic feet per hour containing an average of .0630 cubic feet of carbonic acid gas, and 50 has proved fatal, and 15 dangerous. The other impurities found in inhabited enclosed spaces are well-nigh beyond enumeration, including, additional to various noxious gases, scaly epithelium, nuclei cells, portions of fibre of food, wood, coal and human hair. Not only are the impurities of the air received through the lungs, they are taken into the blood through the five or six million air cells on the surface of the human body. And these millions of pores—an immense system of sewerage—are turning out the impurities as well, adding their quota to the cleansing of the human system by respiration. The skin and lungs pass off from 25 to 40 ounces of water daily; another additional supply of pure air being required to maintain it in a state of vapor. When these normal conditions are manifolded by the necessarily restricted space of a passenger car, and their dangers to health and life itself increased by the presence therein of diseased persons, it is obvious that science should present a remedy.

Our investigation into what has been proposed to remedy this evil in passenger cars covers a period of half a century. During that time the records of the United States patent office bear record to a multitude of devices intended for the ventilation of passenger cars. One of the largest car companies in this country claims to have tried upwards of a hundred of them in the endeavor to ameliorate conditions, and discarded them all. Several of the earliest of these inventions hit squarely upon the right principle, but failed in its application.

"There is nothing new under the sun," and in the matter of ventilation we may learn wisdom from the practice of the ancients. We pump up air from the cellar, the depository of noxious gases. They admitted it through the roof, the highest point of atmospheric purity.

VENTILATION

From time immemorial in Egypt the air was allowed to blow in at the top of the house through large funnels. This method is continually employed on ships at sea, our first record thereof having been proposed by Desaguliers, in 1734 A.D.—the forcing of fresh air in to force foul air out.

In its application to the ventilation of a modern railway or electric car, which was not within the scope of their experience, the principle of the ancients known as an injector requires as a handmaiden as powerful an ejector. Many systems have in a measure, but not without serious defects, provided the one or the other; but not until recently have they happily combined in one perfect system.

For practical illustration, take a passenger coach with 60 passengers occupying one third the space scientists call the limit of safety. To give each the required 3,000 cubic feet of air per hour involves a total of 180,000 cubic feet of air per hour, injected and ejected, and without draft. If it be objected that this frequent change of air cannot be accomplished without drafts, experiments prove to the contrary. Air moving at the rate of only two miles per hour—almost imperceptible—and allowed to pass through a space 20 feet wide will change the air of the space 528 times in one hour. To accomplish this when a car is moving at the rate of from 6 to 60 miles an hour only requires perfect control of the incoming and outgoing currents of air—the control that has now been practically demonstrated by experts of two score of railways and electric railways.

This control of the currents of air is accomplished by the use of an exterior deflector located between two openings in the deck sash, or clear story of the car, and an interior deflector located in the openings. The exterior deflector, or double wing, intercepts the air; in this pause all substance of weight falls, and smoke, steam and gas arise. Thus, separated from all extraneous matter, the air is forced at the rate the car is moving into the forward opening, where it is broken up by the interior deflectors and by them directed to the top of the car. The action of the air on the exterior deflector also produces a partial vacuum behind it, which forms, by suction, the second, or outgoing, current of air.

In this country the earliest record of the use of the exterior deflector was shown in a patent issued in 1860, and of interior deflector in 1869. Like their many successors, until the present year, these did not apply the principle so as to prevent the introduction of extraneous matter or provide an adequate intake or exhaust or control such currents of air as they produced.

In more recent years, elaborate and expensive systems have been tried; one of which being intended solely as an ejector, and another as an injector only. Both accomplished all they claimed, the one the ejection, the other the injection of 60,000 cubic feet of air per hour while 180,000 cubic feet are necessary to maintain healthful conditions. For the injector the right principle was claimed because the air was taken in at the floor line and heated before its delivery. But the 20.6 of oxygen in 1,000 volumes of atmospheric air was so far reduced by the heating process as to render the air injected as lifeless as boiled water. This loss was not offset by any attempt to purify the air other than by obstructions to prevent the intake of cinders.

We cannot simulate nature when we attempt to mix the component parts of the atmosphere, any more than we could successfully produce a chemical substitute for pure spring water. An adequate supply of fresh air, of nature's own mixing, the expulsion at the same moment of the vitiated air in the car, both currents being under such control as to preclude all drafts, is effected by the proper application of the principle exterior deflector, supplemented by properly adjusted interior deflectors. And in zero weather, pure air, containing full 20 per cent of oxygen, injected at the top of the car, where the highest temperature prevails, it has been practically demonstrated does not lower the temperature in the body of the car. On the contrary, the controlled double currents, while purifying the atmosphere from floor line to roof, assist in maintaining an even temperature. This principle, properly applied, provides the safety and comfort of perfect ventilation in railroad and electric cars.

ROSS TAYLOR,

President Automatic Ventilator Company.

Ventilation, Medical Aspects of. The air of rooms is frequently rendered more or less injurious by the accumulation of dust and other suspended matters, or by an undue proportion of one or more of the normal constituents of the air, or by the addition to it of poisonous gases. Dust consists in varying proportions of spores, seeds, cellular tissue, hair, epidermal cells, and other animal substances, of flint-like particles, and of microscopic organisms, some of which may be disease germs. The gases which most often make the air impure are carbon dioxide, carbon monoxide, illuminating gas, hydrogen sulphide, and sewer gas. The organic nitrogenous matter thrown off from the lungs, the emanations from the skin, and other impurities, mingled with carbon dioxide and watery vapor, give to the atmosphere of a room that odor which is so disagreeable to those who enter from the outer air. They are the cause of that close, oppressive sensation perceived so often in the unventilated rooms of tenements. Of the normal constituents of the air, oxygen is the vivifying principle. To diminish its normal amount in a room by the combustion in stoves and lights, and by the expired air mingled with organic matters, is to vitiate the atmosphere. To supply oxygen and to remove these impurities is one of the objects of ventilation. An increase in the amount of carbon dioxide results from the combustion of any substance containing carbon, from the decay and putrefaction of any animal or vegetable substance, from fermentation, and from the respiration of animals. But the amount of carbon dioxide in a room is an index of the amount of organic matter, and the amount of this gas present is a guide to the respiratory impurity of the air.

The investigation of the air as to organic impurities is prolonged and tedious, but an increase in the amount of carbon dioxide which proportionately diminishes the normal amount of oxygen is readily ascertained. The present tendency in respect to houses in cold weather is to keep windows and doors closed, to put on weather-strips, and to overheat apartments. Fresh air is kept out, and the indoor air is fouled. Sore throats, consumption, and various

lung troubles are therefore more common than they were years ago, while disease germs are afforded every opportunity to develop. Many of the dangers arising from impure air may be obviated by suitable ventilation, by chemicals, heat, and steam. Impure air undermines the health and changes the character of the blood. Suitable ventilation is the free admixture of outdoor air with that of apartments, but so modified as to temperature and velocity of current as to prevent drafts, which are injurious, especially to the feeble, the very young, and the aged, for they lower the temperature of the body and produce internal congestions.

Ventilation should take place by night as well as by day. In fact, night air is purer than day air and contains less carbon dioxide. Insufficient fresh air at night in the bedroom is often the cause of sleeplessness. The airing of one room by introducing the confined air from another is not suitable ventilation; neither is it proper ventilation to draw the air from a cellar, or to rely entirely upon the air-chamber of a furnace. If possible the air should be drawn from above the street-level, in order that it shall be comparatively free from dust and other suspended matters. The air of a room should not only be free from any disagreeable odor, but also from a sense of closeness. To maintain the air sufficiently pure for respiratory purposes, 90 cubic metres of fresh air per hour should be supplied to each individual, and each individual in health should have not less than 30 cubic metres of air-space. For the sick in hospitals even double this amount of air-space is none too much. Outdoor air may be brought into rooms through one or more layers of fine wire gauze, woolen, cotton, or linen cloth fitted in frames into the windows, or arranged as screens before the open windows; or it may enter through revolving metal wheels inserted into window-panes; or through small diagonal openings in the window-sashes; or between the two sashes of a window, this being made possible by placing under the lower sash a board, occupying its whole width, and from three to six or more inches high; or, finally, over a cloth fastened to the lower parts of the window-frame, the lower sash of the window being raised.

Ventnor, vēnt'nôr, England, a pleasure-resort on the southeast coast of the Isle of Wight, eight miles southeast of Newport. It is beautifully situated on a terraced site, and has an excellent climate. Besides churches and chapels, it has a Benedictine convent school; a literary and scientific institution, with library and museum; Albert Hall; convalescent homes; and the usual conveniences of a sea-side holiday resort, hotels, boarding-houses, esplanades, pier, park, etc. Pop. (1901) 5,866.

Ventriloquism, the art of speaking in such a way as to cause a hearer to believe that the sound comes not from the person speaking but from a different source. The name originated from the erroneous supposition that the sounds uttered were formed in the abdomen, whereas practice alone is necessary to carry this act of illusion to a high degree of perfection. The sounds are formed by the same organs as the emissions of sound commonly—the larynx, the palate, the tongue, the lips, etc. The art of the ventriloquist consists merely in this: After

drawing a long breath he breathes it out slowly and gradually, dexterously modifying the sound of the voice by the muscles of the larynx and the palate; besides this he moves his lips as little as possible, and by various contrivances diverts the attention of his auditors. This art was known to the ancient Greeks.

Ventura, vān-too'ra, **G. D. Gioachino**, jo-ā-kē'nō, Italian theologian: b. Palermo 8 Dec. 1792; d. Versailles 3 Aug. 1861. At 15 he entered the Jesuit college of his native city, and subsequently was received as a novice by the Theatines. Having been admitted to holy orders as general secretary of the order, he contributed largely to its restoration, and published '*La causa dei regolari al tribunale del buon senso.*' He then was made censor of the press and member of the royal council of public instruction for the kingdom of Naples. He became distinguished for his funeral orations, one of which, on Pius VII., gained him the name of the '*Italian Bossuet.*' In 1824 he was appointed general of the order of the Theatines, fixed his residence at Rome and was presented to the chair of ecclesiastical law in the University of Rome. In 1828 he published his work '*De Methodo Philosophandi,*' in defense of the Christian or scholastic philosophy. This was bitterly attacked by his old friend, the Abbé Lamennais; and, wearied of controversies, Ventura quitted Rome and spent 10 years in retirement, devoting himself to the study of the Scriptures and the Fathers of the Church. During this period he preached his finest sermons, including the funeral sermon of O'Connell, the liberal opinions advanced in which gave him great influence with the people. In 1848 the government of Sicily made him minister plenipotentiary to the court of Rome. In May 1848 he favored the idea of a confederation of the Italian states, with the pope at their head, an impossible scheme. After the flight of Pius IX. he remained at Rome. On 4 May he left the city and retired under the protection of the French to Civita Vecchia, and afterward to Montpellier, in France. Here he wrote '*Letters to a Protestant Minister*' (1849), in answer to a clergyman of Geneva, who maintained that the apostle Peter had never been in Rome. Settling in Paris, he drew crowds to the churches of the Madeleine and St. Louis d'Antin by the eloquence and originality of his discourses. At Paris also he published: '*Histoire de Virginie Bruni*' (1850); '*Les femmes de l'Evangile*' (1853); '*La raison philosophique et la raison catholique*' (1852); '*Essai sur l'origine des idées*' (1853); '*La femme catholique*' (1854); '*L'école des miracles, ou les œuvres de la puissance et de la grandeur de Jésus Christ*' (1854-5); and '*Le pouvoir Chrétien*' (1857).

Ventura, vēn-too'ra, Cal., city, county-seat of Ventura County; on the Pacific Ocean, and on the Southern Pacific Railroad; about 55 miles northwest of Los Angeles. The legal name of the city is San Buena Ventura, from the name of one of the old Spanish missions established here by the Franciscan Fathers. The name of the post-office is Ventura. The city is in an agricultural and fruit-growing region, and the chief industries of the place are connected with the marketing of the farm products and the fruit. In the vicinity are several hot springs.

VENUE — VENUS' LOOKING-GLASS

The principal buildings are the old mission, the Y. M. C. A. building, a public library and reading room, established in 1874, a high school and graded schools. The climate, springs, and general surroundings have made the place a favorite health resort. Pop. (1880) 1,370; (1890) 3,869; (1900) 2,470.

Venue, in law, the place, county or district, where an action is to be tried, and whence juries are to be summoned for trial of causes. In local actions, as of trespass and ejectment, the venue is to be from the neighborhood of the place where the lands in question lie; and in all real actions the venue must be laid in the county where the property is for which the action is brought. See JURISDICTION.

Vēnus, the Roman name of the goddess of love, identified by the Romans with the Greek goddess Aphrodite. In the 'Iliad' she is described as the daughter of Zeus and Dīōnē, but Hesiod represents her as the offspring of Ūranus, born among the foam of the sea. She surpassed all other goddesses in beauty, and hence received the apple which was to be awarded to the most beautiful by Paris. She was the wife of Hephestos (Vulcan), but would scarcely be considered a faithful consort, as she bestowed her love on the gods Arēs, Dionysos, Hermes, and Poseidon, and the mortals Anchises and Adonis. Among her children were Eros (Cupid), Anteros, Hymen, and Hermaphroditus. She had the power of granting beauty and irresistible charms to her votaries. Among plants the myrtle, rose, poppy, apple, and other fruits were sacred to her, and among animals the dove, sparrow, swan, swallow, ram, hare, and tortoise. The chief places of her worship in Greece were the islands of Cyprus and Cythera. Before she was identified with the Greek Aphrodite, Venus, the Roman goddess, was one of the less prominent divinities in the religion of the Romans, yet her worship seems to have been established in Rome at an early period. Here several temples were erected to her at different times and under different names. In the best days of art this goddess was sometimes represented draped, at other times nude. The most celebrated ancient statue of Aphrodite was that in Cnidus by Praxiteles; there are copies of it in the Vatican and at Munich. Other celebrated statues are the Venus of Milo, in the Louvre, and the Venus de' Medici, at Florence.

Venus, in astronomy, the second planet in order of distance from the sun. The mean distance of Venus from the sun is 67,200,000 miles; its orbit has an eccentricity of .00686, and the plane of its orbit is inclined to the plane of the ecliptic at an angle of $3^{\circ} 23' 31''$. Venus increases in brightness as it moves from that position which corresponds to the phase of new moon, as the bright side of the planet turns toward us; but the distance between us and Venus also increases at an increasing rate, so that the apparent diameter becomes smaller; a point is reached when the rate of increase of brightness is equal to the rate of decrease of apparent diameter, and then the planet is brightest; a corresponding position occurs after it passes the full phase. Schiaparelli's observations led him in 1890 to the conclusion that the day and the year of Venus are alike. A transit of Venus means a passage of the planet across the solar disk seen from the earth. During a

transit, suppose an observer can note the position of the planet at a particular instant on the sun's face, and that another observer at a different station can note the position of the planet at the same instant, the difference of the observed positions in connection with the distance of the observers apart gives a means of calculating the distance of the sun from the earth. A transit of Venus occurred in 1874, and there was another in 1882. From these the sun's distance has been more accurately obtained than before.

Venus of the Capitol, a famous ancient Greek statue preserved in the Capitoline Museum, Rome. The goddess is represented undraped, with her arms in the position of the still more noted Venus of Melos, her drapery being cast upon a vase beside her.

Venus Flower-basket, one of the glass-sponges (q.v.).

Venus Fly-trap, a plant. See DIONÆA.

Venus Genetrix, jën'c-trîks, a statue of Venus set up in a splendid temple by Julius Cæsar in the forum laid out by him just after his victorious return from his campaign against Pharnaces (46 B.C.). He took the title from the first words of the proœmium with which the poem of Lucretius 'De Natura Rerum,' then only a few years published, opens — 'Æneadum Genetrix,' "Mother of the Descendants of Æneas." Julius Cæsar traced his descent with that of the whole Julia gens to Iulus, the son of Æneas, the latter being the son of Venus, according to the Trojan cycle, by Anchises. Hence the whole Roman people were called upon to look upon Venus as their divine ancestor. Hadrian added the title 'Victrix,' victorious, to that of Genetrix, in 134 A.D. and built a double temple to her honor near the Colosseum. The statue which is commonly known as 'Venus Genetrix' is the copy of a Greek original, now in the Louvre, Paris; but the marble statue of the same name in the Vatican is really the only copy extant of the bronze statue by Arcesilaus which stood in the temple built by Cæsar in his forum, the Forum Julium.

Venus of the Hermitage, a Parian marble antique statue discovered in Rome in 1859, and now to be seen in the Hermitage, at St. Petersburg. It has been only slightly restored and is a close replica of the Venus of Medici, with a somewhat less conscious pose.

Venus' Looking-glass, a very pretty little annual, *Specularia speculum*, of the Campanulaceæ, which has long been a favorite in flower-gardens, and is a native of corn-fields in the south of Europe. It has brilliant blue, white, or violet-colored flowers, which fold up in a pentagonal manner toward evening. This name has been extended to the whole genus. The familiar American species is *S. perfoliata*, a more or less pubescent, stiffly erect herb, having crowded orbicular or broadly ovate leaves, crenulate, diminishing in size toward the top, and clasping the stem closely with their cordate bases. The later rotate violet-blue corollas peer out from the upper axils, so that the whole plant looks like a leafy spike of flowers. They frequent dry and sandy fields, are common, and are remarkable for their dimorphic flowers. The primary and lower flowers are small and cleistogamous, the calyx being longer than the minute corolla of valvate, connivent petals,

CTENOPHORES.

VENUS' GIRDLE AND OTHER COMB-JELLYFISH

VENUS DE' MEDICI — VERAGUA

which apparently never open spontaneously, but are self-fertilized and mature perfect seeds. The fruit is an oblong capsule opening by valves near the middle.

Venus de' Medici, an antique statue which was found at Tivoli in the villa of Hadrian in the 17th century in 11 fragments, and was deposited in the Medici Palace, whence it passed in 1680 to Florence. At the end of the 18th century it was carried off to Paris and placed in the Louvre, where it at present stands. It belongs to the decadent period of Greek art during which the repose and somewhat hieratic action of sculpture had given place to the expression of momentary emotion; and the massive lines of Phidias and his school were succeeded by an intro-refinement in form and a piquancy in attitude bordering on the meretricious.

Venus of Melos, a celebrated Greek statue now in the Louvre, Paris. It is so called on account of its discovery in the island of Melos in 1820. Its date is assumed to be between the time of Phidias and that of Praxiteles, or about 400 B.C. The statue represents a majestic woman, undraped to the hips, standing with the weight on the right foot and with the head turned slightly to the left. The arms are broken off, and their original position has been much disputed. The statue is also called the Venus of Milo.

Venusberg, vā'noos-bërg. See TANN-HAUSER.

Venus' Girdle, an oceanic ctenophoran (see CTENOPHORA) remarkable for its shape, which is that of a ribbon, sometimes nearly five feet in length and about two inches in width, — a filmy, semi-transparent undulating creature long ago named *Cestus l'encriis*, "girdle of Venus." This shape is due to thin wing-like expansions in a vertical plane from opposite sides of the body which is in the middle of the "ribbon," and conforms to the ordinary ctenophoran, especially when young. Two of the ciliated swimming plates are extended along the upper and lower edge of the ribbon, and the creature swims by the aid of them and by an undulatory action. This curious and elegant jellyfish occurs frequently in warm seas, at all distances from land. Consult Parker and Haswell, 'Zoology' (New York 1897).

Vera Cruz, vë ra krooz (Sp. vā'rā krooth), or **Veracruz**, Mexico, (1) the chief port of the republic; one of the three Mexican Gulf ports that are open to foreign commerce, the other two not restricted to coastwise trade being Tuxpam and Coatzacoalcos, which are also in the state of Vera Cruz. Among the public institutions or noteworthy buildings are: the Artillery School, People's Library (20,000 volumes), Chamber of Commerce, churches, municipal palace, and theatre. The city is supplied with street railways; the harbor with two lighthouses. For foreign and interior communication by steamship lines, submarine cable, railway, and telegraph, see below. The population of the city in 1900 was 24,085. It is the chief town of the canton which bears the same name. Mr. Robert T. Hill writes: "Mexico has excluded yellow fever from Vera Cruz, where, until the past ten years, it had an even more tenacious hold than in Havana."

(2) A State, bounded by Tamaulipas on the north, by the Gulf of Mexico on the east, by Oaxaca on the south, and by San Luis Potosí, Hidalgo, and Puebla on the west; almost entirely a mountainous region, with only a narrow border of hot and unhealthy coast below the Sierra Madre range, which occupies its central and western portions and rises to a height of more than 12,000 feet above sea-level. At elevations of more than 3,000 feet, the climate is comparatively healthful and temperate, and the vegetable products in their variety correspond to the various conditions of temperature and humidity. Thus, cereals are grown in the state, as well as sugarcane, cotton, tobacco, cacao, coffee, and vanilla; and stock raising is carried on successfully. The natural pasturage lands in the Huasteca Potosina region are especially fine, and Vera Cruz shares them with Tamaulipas and San Luis Potosí. Mineral products are silver, gold, coal, copper, lead, iron, mercury, asphalt, marble, petroleum, and the precious stones, opals, amethysts, etc. But the importance of the state rests mainly upon its commercial relations with other sections of the republic, with the West Indies and South and Central America, and with the western European nations. The total annual value of imports and exports and of domestic trade is estimated at \$100,000,000, many of the articles that Mexico sends to foreign countries or receives from them passing through the open ports mentioned above. A list of the industrial establishments includes several foundries, cotton, paper, woolen and saw-mills, and manufactories of chocolate, wax matches, etc. Means of communication are as follows: Seven railway lines, namely, the Mexican, from Vera Cruz to Mexico City, the Interoceanic, the Vera Cruz and Alvarado, the Central, the Córdoba and Tuxtepec, and the short lines connecting Jalapa with Coatepec, and Vera Cruz with Antigua; telephone, telegraph, and postal service; good highways; steamship lines from the United States, England, Germany, and France, beside coastwise vessels; cable connection via Galveston, etc. The capital of the state is Jalapa (also written Xalapa), a city with about 18,000 inhabitants which stands in a good agricultural district. Orizaba, chief town of the central interior canton of the same name, has a population of 31,512. The total population of the state, distributed, except as above indicated, among small towns and villages, was given as 960,570 in the census of 1900. The area being 29,201 square miles, the average number of inhabitants to the square mile is about 33. Historically, the harbor of Vera Cruz is interesting as the scene of events that marked both the beginning and the end of Spain's supremacy in Mexico. Cortés landed there (on the island of San Juan de Ulua in that harbor), 21 April 1519, when he came to conquer the Aztec kingdom; and there on 30 July 1821 O'Donojú, the 62d Spanish viceroy, landed when he came to face a desperate situation, and to learn that Mexican independence had been practically achieved.

MARRION WILCOX,
Authority on Latin-America.

Veragua, vā-rā'gwā, DUKE OF, dukedom created for the lineal descendants of Christopher Columbus: first borne by his grandson, Luis Columbus, in 1536. It was next inherited by Diego Columbus, great-grandson of the dis-

VERAGUA — VERBENA

coverer, upon whose death without issue in 1578 the direct male line of Columbus became extinct. The title was 30 years later settled upon the descendants of Isabel, sister of Luis, the first duke, and upon the extinction of that line in 1733, passed to the descendants of Francesca, sister of Diego, the second duke. The present incumbent, 13th in descent from Christopher Columbus, b. Madrid, Spain, 1837, was, in 1893 the guest of the United States government at the opening ceremonies of the Columbian Exposition, and was received with high honors by the American people.

Veragua, Panama, a region on the north coast of the isthmus. It was named by Columbus, who discovered it in 1502, but was unable to effect a settlement there on account of the Indians. Similar attempts were made by Diego de Nicuesa in 1509, and by Maria de Toledo, acting for her son, Luis Columbus, in 1535; but neither of these was successful. It was partly settled during the colonial period, and for a time was a province of New Granada. It gives its name to the title bestowed on the grandson of Columbus, now borne by a descendant of the discoverer's great-granddaughter.

Veratin, or **Cevadin**, $C_{12}H_{19}NO_6$, a vegetable alkaloid found in certain species of *Veratrum* or *Hellebore*, and along with sabadillin and veratridin in sabadilla seeds. A colorless crystalline powder, very acrid and poisonous. Insoluble in hot water or alkalies, slightly so in ether, very easily soluble in alcohol. It is used somewhat in medicine as a liniment or ointment for external application in cases of acute neuralgia. A very small amount getting into the nostrils causes violent sneezing.

Vera'trum (Lat. *hellebore*), a genus of lilaceous plants, better known as hellebore (q.v.).

Verazzano, vā-rāt-sā'nō, or **Verrazano**, **Giovanni da**, Italian navigator and explorer in the New World: b. near Florence about 1480; d. Pico, New Castile, Spain, November 1527. He is described as having traded with the Orient, and about 1505 entered the maritime service of France. By that government he was employed as a privateer, or pirate, for the capture of Spanish prizes. In 1523 he took the treasure-ship sent by Cortes to Charles V. On 17 Jan. 1524 he sailed from the Madciras on an exploratory voyage to North America. He discovered land near Cape Fear, discovered also a bay—either New York or Narragansett—went northeastward to lat. 50° N., and then returned to France. He was later captured and executed by the Spaniards. The only known evidence for his discoveries is a letter from him to Francis I., published in Italian by Ramusio in 1556, there being apparently no extant French original. The genuineness of the letter has been attacked; but is skilfully defended in Brevoort's 'Verrazano the Navigator' (1874). Consult also Murphy, 'The Voyage of Verrazano' (1875); Da Costa, 'Verrazano the Explorer' (1880).

Verbeck, vēr-bēk', **Guido Fridolin**, Dutch-American missionary: b. Zeist, Holland, 1 Feb. 1830; d. Tokyo, Japan, 9 March 1898. He removed to New York in 1852 and was graduated at the Auburn Theological Seminary, Auburn, N. Y., in 1859. In the same year he was sent

to Japan by the Reformed (Dutch) Church of America, and in 1863 the Japanese government engaged him to carry on educational work. He was superintendent of instruction and teachers in the foreign department at the Imperial University, Tokyo, 1869-73; was engaged in missionary work 1873-9, and was then again employed by the government as a translator and organizer. In 1891 he was made instructor of theology in the Meiji Gakuin. He was the author of 'History of Protestant Missions in Japan' (1883), and the translator of 'The Code Napolcon'; 'Two Thousand Legal Maxims.' Consult Griffis, 'Verbeck of Japan' (1900).

Verbe'na, a name anciently applied to any herb used in religious rites, but now restricted to a genus of plants typical of the order *Verbenaceae*. The species, of which about 110 have been described, are mostly annual and perennial herbs or shrubs distributed mainly in the American tropics but extending northward in the United States, where some weedy species are common in gardens and other tilled land. They are characterized by erect or trailing stems which usually bear opposite leaves and terminal spikes, sometimes panicles or corymbs of often showy flowers, for which some of the species have become widely popular as ornamental garden plants. The European verbenas or vervain (*V. officinalis*) is an annual herb with slender paniculate spikes of small purplish flowers. It was formerly in high repute in medicine and was probably introduced into America for such purposes and cultivated by early settlers. It has become naturalized in some places along roadsides and waste places, but is not a troublesome weed. The showy garden verbenas are derived mainly if not wholly from South American species, the first of which were introduced into cultivation between 1826 and 1838. *V. chamædryfolia*, a brilliant scarlet, *V. phlogiflora*, a rose or purple, and *V. incisa*, another rose or purple, were the first introduced, and *V. tenu-crioides*, a white-flowered species, appeared in gardens in 1838. These four species are the most important, since they are the chief progenitors of the garden verbenas, though two other species (*V. aubletia* and *V. tenera*) have apparently been employed by florists for hybridizing. Since the progeny of these hybrids rarely produce germinable seed, the species are believed to have had a very small influence upon the present garden forms. A Brazilian species (*V. venosa*) is a tuberous-rooted plant whose panicles, lilac, bluish-purple or sky-blue flowers are fragrant at night. Its tubers are stored over winter in cold climates. This species may also be propagated like other garden kinds by seeds sown under glass during late winter, the seedlings being transplanted after being inured to the temperature of the open air. Another favorite way of propagating verbenas is to peg down the stems of the plants and allow them to take root. But the most popular method employed, where named varieties or special colors are desired, is by cuttings which are generally taken in early autumn and by proper management afford additional cuttings before midwinter. Verbenas thrive best in rather rich, deep, light, well drained loam. If well exposed to the sun for at least part of the day, and if the stems are pegged down so as to take root they should give a constant succession of bloom throughout the summer and

until frost. Consult Bailey, 'Cyclopedia of American Horticulture' (New York 1900-2).

Verboeckhoven, vër-book'hō-vën, **Eugen Joseph**, Dutch painter: b. Warneton, West Flanders, 9 June 1798; d. Brussels 19 Jan. 1881. His father was a sculptor and taught him to emboss and to draw. In 1821 he produced his first large canvas, 'The Cattle Market at Ghent,' and the reputation he gained by this success enabled him to settle at Brussels, open a studio, and from 1847 put forth one after the other a series of animal pictures, especially landscapes with sheep, which received much applause from their careful, truthful drawing and the refinement and smoothness of their execution. Of his paintings seven are in Leipsic and three in the Berlin National Gallery. There are two fine examples of this painter's work in the New York Metropolitan Museum.

Verd Antique, vèrd än-tèk', a name applied to serpentine which will take on a good polish, and is more or less streaked by veins of calcic-carbonate. It is much used in the arts.

Verdan'di. See NORNIS.

Verde, vèrd, **Cape**. See CAPE VERDE.

Verdi, vër'dē (**Fortunino**) **Giuseppe (Francesco)**, Italian composer: b. Le Roncole, near Busseto, Parma, 9 Oct. 1813; d. Milan 27 Jan. 1901. His earlier musical education he received from a local musician of Le Roncole and Giovanni Provesi, maestro di cappella of the cathedral of Busseto and director of the Società Filarmonica there; and he wrote for this orchestra several marches, a symphony, and other instrumental pieces now treasured in manuscript in the Busseto library. In 1831 he went to Milan to continue his studies, but upon his application for a scholarship at the Conservatorio was rejected, and then studied composition and instrumentation with Vincenzo Lavigna. Upon his return to Busseto, he became conductor of the Filarmonica and organist of San Bortolommeo. From 1838 he was again at Milan, where his first opera, 'Oberto, Conte di San Bonifacio,' was presented with considerable success at La Scala. 'Un Giorno di Regno' (1840), called 'un bazar de reminiscences,' was an utter failure, but 'Nabucodonosor' (1842), to a Biblical libretto by Solera, was received so well as at once to establish his reputation. 'I Lombardi' (1843), and 'Ernani' (1843), with libretto from Hugo's 'Hernani,' were even more pronouncedly successful. The Austrian government in both cases made objections to the revolutionary ideas contained in the works. The political demonstrations of the time were no doubt of aid to the composer; and, in fact, the name Verdi was employed by the patriot party as an acrostic for Vittorio Emanuele Re D'Italia. 'Ernani' was the first of Verdi's words to be produced in England. He was now kept busy supplying impresarios with operas. Most of these were fiascos, complete or partial. Perhaps the worst was 'I Masnadieri,' which Verdi traveled to London to conduct (1847), but could not redeem. Yet with 'Rigoletto' (1851) he entered his most brilliant period. This, with 'Il Trovatore' (1853), and 'La Traviata' (1853), are classed as marking his second manner. They reveal a great advance over 'Ernani' in the treatment of both voice

and orchestra. Their success in and beyond Italy was very great; they confirmed Verdi's reputation, and they have remained incorporated in the general repertoire of Italian opera. Then followed another series of failures. 'Les Vêpres Siciliennes' (1855), written for the Paris Opéra, to be produced during the Universal Exhibition, had, indeed, a somewhat temporary success; and 'Un Ballo in Maschera' (1859) has been at intervals revived. Orsini having recently (13 Jan. 1858) made an attempt on the life of Napoleon, the scene of the latter was changed from Sweden to Boston, Mass., and one Riccardo, earl of Warwick and colonial governor, was assassinated instead of Gustavus III. Verdi was now working out a new method of expression, liberated from the traditional utterance of the Italian school. With 'Aida,' on an Egyptian subject, written at the request of Ismail Pasha and presented at Cairo in 1871, he first declared his third manner, revealing to a considerable degree Wagnerian influence, without, however, surrendering the leading features of Italian music. The orchestral resources were greatly increased, but the vocal score was still the major part of his scheme. A 'Requiem Mass,' his only non-operatic work of considerable importance, written in 1874 in commemoration of the death of Manzoni, applied this new manner to sacred music. It was the centre of much discussion, being attacked by von Bulow and defended by Brahms. A revised version of 'Simone Boccanegra,' a work which had failed in 1857, was presented with much success at Milan in 1881; and in 1887 'Otello,' with a libretto by Boito, who had largely rewritten that of 'Simone Boccanegra.' Here and in 'Falstaff' (1893), a comic opera, with a libretto also by Boito, there is an increase in dramatic characterization. In 1898 Verdi wrote four sacred works, a 'Te Deum,' a 'Stabat Mater,' an 'Ave Maria,' and 'Laudi Alla Vergine' (words from Dante). Outside these and the Manzoni 'Requiem,' he wrote little save operas, though mention may be made of a string quartet (1873). A full chronological list of his operas is as follows: 'Oberto' (1839); 'Un Giorno di Regno' (1840); 'Nabucodonosor' (1842); 'I Lombardi' (1843); 'Ernani' (1844); 'I Due Foscari' (1844); 'Giovanna d'Arco' (1845); 'Alzira' (1845); 'Attila' (1846); 'Macbeth' (1847); 'I Masnadieri' (1847); 'Il Corsaro' (1848); 'La Battaglia di Legnano' (1849); 'Luisa Miller' (1849); 'Stiffelio' (1850); 'Rigoletto' (1851); 'Il Trovatore' (1853); 'La Traviata' (1853); 'Les Vêpres Siciliennes' (1855); 'Simone Boccanegra' (1857; rev. 1881); 'Aroldo' (revision of 'Stiffelio,' 1857); 'Un Ballo in Maschera' (1859); 'La Forza del Destino' (1862); 'Don Carlos' (1867); 'Aida' (1871); 'Otello' (1887); 'Falstaff' (1893). Verdi's position in musical history has not been determined. For studies of him and his work consult Mazzucato in Grove's 'Dictionary of Music and Musicians,' Vol. IV. (1889); Hanslick, 'Moderne Oper' (1885); Pongin, 'Verdi, an Anecdotic History of his Life and Works' (translated from the French by Matthew (1887); Crowest, 'Verdi: Man and Musician' (1897); Berinello, 'Giuseppe Verdi' (1899); Soffredini, 'Le opere di Verdi' (1901).

Verdigris, a basic acetate of copper that is prepared by exposing copper plates to the ac-

VERDIN — VERGIL

tion of dilute acetic acid or weak vinegar. It is a blue-green amorphous powder, is very poisonous, and is used as a pigment, as a mordant, and to some slight extent in medicine.

Ver'din, or **Goldtit**, a small yellow bird (*Auriparus flaviceps*) of southern California and Mexico, which is one of the most attractive in habits and voice of the birds of that region. It is allied to the titmice.

Verdun, vēr-dūn, France, a fortified town in the department of the Meuse, in a valley on the river of that name, 150 miles northeast of Paris. It has a citadel, the work of Vauban, and is defended by eleven detached forts of modern construction. The principal buildings are the cathedral, which dates from the 11th and 12th centuries, the bishop's palace, and the hôtel de ville. The liqueurs and confectionery of Verdun are famous. The town was captured by the Germans (after a spirited defense) on 9 Nov. 1871. Pop. (1896) 22,152.

Vere, vēr, **SIR AUBREY HUNT**. See DE VERE, SIR AUBREY HUNT.

Vere, **Aubrey Thomas**. See DE VERE, AUBREY THOMAS.

Vere, **Edward de**, 17TH EARL OF OXFORD, English wit and poet: b. England 2 April 1550; d. Newington, Middlesex, 24 June 1604. He was educated at Cambridge, and at 12 succeeded to the earldom with its hereditary dignities, including that of lord great chamberlain of England. He became prominent at the court of Elizabeth when still a boy, took his seat in the house of lords in 1571, and was subsequently a noted figure in court circles. His wit and poetical gifts made him a favorite with Elizabeth, who showered him with attentions; he was famous for his wild extravagance which eventually dissipated his patrimony; and as his years increased he became more than ever eccentric, while his temper, never controlled, acquired a violence which endangered even his favor with the queen. As lord high chamberlain he presided at the trial of Mary, Queen of Scots, in 1586, and at that of the Earl of Arundel in 1589. He was the author of several popular comedies which have been lost, and his poetry displays much lyric beauty. Of the latter some 23 pieces have been proved as his work, though most of it has perished with his comedies. His extant verse was collected and printed by Grosart in 'Miscellanies of the Fuller Worthies Library' (1872).

Vere, **SIR FRANCIS**, English soldier, grandson of the 15th Earl of Oxford: b. Crepping Hall, Essex, 1560; d. London 28 Aug. 1609. He entered the army in early youth, served under the Earl of Leicester in the Netherlands in 1585, and in 1588 his conduct at the defense of Bergen-op-Zoom won for him the honor of knighthood. He prepared the way for the capture of Zutphen in 1591, was engaged in the taking of Nimeguen in that year, and in 1592 relieved Prince Maurice at Koevorden. He remained in the Netherlands until 1595, and in 1596 he led the expedition against Cadiz. He was again ordered to Holland in 1597, engaged with Prince Maurice at Tumhout, and in 1598 was appointed governor of Brill and general of the forces in the Netherlands. At the battle of Nieuport in 1600 he performed service which turned the tide of battle in favor of Maurice,

but was severely wounded and compelled to retire from the field. In 1601-2 defended Ostend with signal success though against great odds, and in 1606 returned to England, where he was appointed governor of Portsmouth and of the island of Portsea.

Verestchagin, vēr-rěsh-chä'g'en, **Vasilii**, Russian painter: b. province of Novgorod 25 Oct. 1842; d. on board the battleship Petropavlovsk 13 April 1904. He was educated at the naval school in St. Petersburg, but, devoting himself to painting, he entered the St. Petersburg Academy. In 1861 he traveled in Germany, France, and Spain, and in 1864 he entered the Ecole des Beaux Arts at Paris, where Gérôme was his master. He joined the Caucasian expedition under General Kaufmann in 1867, and in 1869 went to Siberia. In 1874 he went to India with the Prince of Wales, and afterward settled in Paris. He took part in the Russo-Turkish war, and was wounded at Plevna. Subsequently he visited all the chief cities of Europe, as well as the United States, exhibiting his pictures. They are of immense size, extremely realistic, and treat chiefly of the horrors of war. Among his war pictures are: 'An Unexpected Attack'; 'Before the Victory'; 'After Defeat'; 'Assault on Plevna'; 'After the Assault'; 'Apotheosis of War'; 'Wounded Returning'; 'Our Prisoners'; 'All Quiet at Shipka'; 'The Route to Plevna'; 'The Retreat from Moscow'; 'The Forgotten Soldier'; and, his latest work, a fanciful picture of the battle of San Juan Hill in the Spanish-American war with Roosevelt as the hero. He also took up religious subjects, and his 'Family of Jesus' and 'Resurrection' attracted some attention. He wrote reminiscences, translated into English, such as 'Verestchagin, Painter, Soldier, Traveler' (1888); 'Napoleon I. in Russia' (1899); etc. On the opening of the Russo-Japanese war he accompanied the Russian forces and on the sinking of the battleship Petropavlovsk went down with the ship. Verestchagin was much more than a realist; he was in essentials a poet of tragedy. By his great war pictures he brought home to national consciences the intense significance of the pain to the individual in its relation to the supposed interests of government.

Vergennes, vēr-jěnz', Vt., city in Addison County; on Otter Creek, and on the Central Vermont Railroad; about 35 miles west by south of Montpelier, 22 miles south of Burlington, and seven miles from Lake Champlain. In the summer there are regular steamboat connections with the lake ports. There is here a fall of 30 feet in Otter Creek. The city is the seat of the State Reform School, and has public and parish schools and a public library. There is one national bank with a capital of \$150,000. The industries are connected chiefly with farm products.

Vergennes was settled in 1766 and in 1788 was incorporated. It was the first incorporated city in the State. During the War of 1812 the city was an important naval depot; the fleet of Commodore McDonough (q.v.) was fitted out here. Pop. (1890) 1,773; (1900) 1,753.

Vergil, vēr'jil (PUBLIUS VERGILIUS MARO), Roman poet: b. near Mantua in Cisalpine Gaul, 15 Oct. 70 B.C.; d. Brundisium, Italy, 21 Sept. 19 B.C.

VERGIL

The Roman writers differ greatly in the amount of biographical information which they themselves give us, and Vergil forms a marked contrast in this respect to his friend and contemporary, Horace. This is doubtless due in part to the nature of the themes which he treated, but in part also to his natural modesty and shrinking from every form of publicity. Fortunately, however, besides allusions of a casual nature in the works of other Roman writers, three ancient biographies of the poet have come down to us. The best of these is that of Aelius Donatus, of the 4th century, which though distorted in some particulars, seems to be based upon good sources, and to give accurately the main details of Vergil's life.

Vergil was born in the country, in a district called Andes, not far from the modern Pietola, three miles below Mantua on the river Mincio. His father was of humble origin, and is said by some to have been a potter, by others the hired laborer of one Magius. He married Magia Polla, the daughter of his employer, and finally became himself the owner of a small estate, from which he made a living by farming and bee-keeping. He prospered sufficiently to be able to give his son a thorough education, at first in the neighboring town of Cremona, and afterward at Naples and Rome. Of these opportunities Vergil took the fullest advantage. He was always a diligent student, and like Cicero made a thorough preparation for his life work. At Naples he took up the study of Grecian literature under Parthenius; at Rome he not only applied himself to the regular curriculum of rhetoric and philosophy, but besides studied medicine, mathematics, and natural philosophy. He seems to have owed most to the Epicurean Siro, through whom he probably became acquainted with the work of Lucretius, by which he was strongly influenced, as was recognized by the ancient critics. He also acquired a love for philosophical speculation which lasted throughout his life and profoundly affected his literary work. Vergil is said to have suffered constantly from dyspepsia and headache, and his ill-health, as well as his retiring disposition and studious habits, turned him from the usual political or military career. He held no public office of any sort, and in fact spent little time in Rome, finding the milder climate of Campania and Sicily more congenial. He seems to have amassed a comfortable fortune from the liberality of his patrons, for in his later life he owned several country places and a house at Rome on the Esquiline Hill. He enjoyed the friendship of the most distinguished men of his day, both in the world of letters and in public life. He never married, and his name is associated neither by himself nor by others with any affairs of the heart. After the completion of his course of study at Rome, we lose sight of Vergil completely for about ten years. It seems probable that he retired to his native place, and busied himself with the management of his paternal estate and with study. This quiet life was rudely interrupted after the battle of Philippi in 42 B.C. His estate was included in the proscriptions which were made in Cisalpine Gaul for the benefit of the veterans of Antony and Octavian, and he is said to have had a narrow escape from death at the hands of one of the soldiers. The

details of the affair are confused and uncertain. We know, however, that Vergil went to Rome to appeal for protection, where he made the acquaintance of Mæcenas and of Octavian. He was unable to recover his property, but seems to have been given another estate, perhaps the one which he is known to have owned near Nola in Campania. His visit to the capital had, however, much more important consequences, which influenced his whole future life. He became a member of the literary circle which Mæcenas had gathered about himself, to which he was afterward the means of introducing Horace, and through the generosity of his patron was enabled to devote all his time to literary work and to study. In the year 19 B.C. Vergil undertook a journey to Greece and Asia Minor, with the intention of revising the 'Æneid,' of which he had made a preliminary draft, and then devoting the rest of his life to his favorite philosophical studies. At Athens he met Augustus, who persuaded him to return with him to Italy. Vergil had contracted a fever from exposure to the sun at Megara, and was ill when he embarked. He died shortly after landing at Brundisium, and was buried near Naples. The exact location of his tomb is a matter of uncertainty.

We know something of the poet's personal appearance from the description of Donatus. According to him Vergil was large of frame and dark complexioned, and had a certain air of rusticity. This description tallies with the authentic portraits which we possess, which form a very small part of the great number which bear his name. The best are two mosaics, one discovered at Trier in 1884, the other at Susa in Africa in 1806. In character he was gentle and lovable, and so extremely modest, that he is said to have taken refuge in the nearest shop or doorway to avoid notice.

Although Vergil, like nearly all of the great writers of his nation, was born outside of Rome, he is one of the most patriotic and intensely Roman of all his countrymen. He belongs with Horace to the national school; for, though, unlike his friend, he was strongly influenced by the Alexandrine Greek writers, to whom he was introduced by Parthenius during his studies at Naples, he drew from them only what was best in their work and avoided their defects. He owes to them the cosmopolitan tone which has made him popular with all nations and all ages, and his mastery in the treatment of the passion of love. He is not an Alexandrine in the sense in which that term is ordinarily used, but like Cicero developed a characteristic style of his own.

The first undoubtedly genuine work of Vergil which has been preserved is a collection of ten pastoral poems, called variously the 'Eclogues' (*Eclogæ*) and the 'Bucolics' (*Bucolica*). These were probably composed between the years 43 and 37 and are the first Roman representatives of that branch of poetical literature. They were, however, far from being an original creation, but on the contrary are modeled on the 'Idyls' of Theocritus with a closeness of imitation which is rare even among Roman writers. The names of the characters are in most cases taken from the Greek original, and the landscape has nothing which suggests the scenes amid which Vergil passed his early life, but is throughout Sicilian. And yet the genius

VERGIL

of the poet succeeded in impressing itself on this early work, and it has always justly been given a high rank in the history of Roman literature. The 'Eclogues' fall into two distinct classes, each represented by five poems, the purely pastoral pieces, which sing of various phases of the life of the idealized shepherd, especially contests in song; and the allegorical poems, which introduce the poet himself and his contemporaries in the guise of shepherds. The latter are naturally the more original, and they are also by far the more difficult of interpretation. The most widely known of all is probably the 4th Eclogue, which celebrates the birth of a child, about whose identity there is a difference of opinion, who is to bring back the Golden Age to Italy. It owes its renown in a great measure to the belief, which became current in the Middle Ages, that it was a prophecy of the coming of the Messiah.

Vergil's next work dealt also with the country life with which he was so familiar and loved so much. Mæcenas and Augustus are said to have suggested to him the writing of a poem on agriculture, in the hope of making farm life more attractive to the people of Italy, but the poet must have required little urging to induce him to take up a subject so congenial. He had an abundance of material at hand to draw on among the Greek writers, and the topic had been a favorite one with the Romans as well, though it had not as yet been treated in verse. Vergil expressly acknowledges his obligations to Hesiod, but he owes more to the Alexandrine writers Nicander and Aratus. In four books he writes of the management of fields, the growing of trees, the rearing of horses and cattle, and bee-keeping. He avoids with great skill the dryness of a didactic work by the introduction of such digressions as the praise of spring, and by a general lightness of touch which gives an attractive form even to the most commonplace details. He composed slowly and with loving care, and polished his language and versification to the highest degree of refinement. The 'Georgics' have justly been called the most finished poem in the Latin language, and Addison even calls it the most finished of all poems.

After the publication of the 'Georgics' in 29, Vergil set about the greater task of writing a national epic. This was a plan which he seems to have formed early in life and for which he had been preparing for many years. He was forced against his own judgment to take it up thus early by urgent requests from Augustus and Mæcenas. In this field he had not the advantage of being a pioneer, for Nævius, in his 'Bellum Punicum,' and more particularly Ennius in his 'Annales' had treated of the early history of Rome in this way. The latter had connected the destiny of Rome with that of Troy, and his epic was regarded as a great achievement. Vergil could hardly depart radically from the plan of his great predecessor, but he surpassed him not only in finish of style, but also by introducing the philosophical reflection and the breadth of treatment which distinguish history from mere chronicle. He made very free use of the works of his predecessors, and among the Greeks not only of the 'Iliad' and the 'Odyssey,' but of the Cyclic poets and of Apollonius of Rhodes. The proud boast of Propertius, *nescio quid maius nascitur Iliade*,

as well as the subject of the epic, at once challenged a comparison with the Homeric poems which was freely accepted in antiquity; but in modern times this has been detrimental to Vergil's fame. The comparison is unfair, because the 'Aeneid' and the Homeric poems really represent different types of the epic. The primitive epic, of which the 'Iliad' and the 'Odyssey' are unrivaled specimens, is not represented in Roman literature and is foreign to the Roman national character. The works of Nævius and Ennius, as well as those of Vergil and the later Roman epic writers, are of the historical type, and in this field the supremacy of Vergil is almost universally recognized. While the Homeric poems represent the gradual accumulations of generations of singers, the 'Aeneid' was composed as a complete work of art, with a definite purpose, the glorification of Rome and of the Julian house. The introduction of the gods of the Greek pantheon is in the nature of "epic machinery," since Vergil's generation had no faith in them, and the poet himself was doubtless too much influenced by Lucretius, and by his philosophical studies in general, to be an exception to the prevailing skepticism. At the same time his nature was reverent and religious, and a desire to effect a revival of the old Roman piety doubtless formed part of his plan and was thoroughly in accordance with the wishes of his patrons. The 'Aeneid' describes the wanderings and adventures of Aeneas from the time of the fall of Troy until the establishment of his destined empire in Latium. In accordance with the regular rule of epic composition the poet plunges at once *in medias res*, and begins his tale with the sixth year of the voyage of his hero. The story of the earlier years is told graphically by Aeneas himself at Dido's court in Carthage. While the greatness of the poem can only be fully appreciated when it is studied as a whole, it is more generally known in part; the last six books, though full of beautiful episodes, are less generally read because of the numerous and somewhat monotonous battle scenes which epic tradition demanded of the poet, in which he is not at his best. Probably the most widely known part of the poem is the episode of Dido, which forms a complete epic tragedy, and bears witness to the poet's familiarity with the masterpieces of Greek drama. The unhappy Carthaginian queen, like Aeneas, had her mission to perform and her empire to establish, but her plans were forced to give way before the mightier destiny of Aeneas. Through the wiles of Venus, which even Juno's power cannot thwart, she falls in love with the Trojan hero, and strives to detain him in Carthage. He finally leaves her in obedience to the command of Jupiter, and Dido slays herself as his ships are passing out of sight. As she dies, she prays that there may be eternal hatred between Carthage and Rome, and the long and bloody struggle which ended in the destruction of the city which she founded forms the sequel to the tragedy. These wars furnished a motive for a great historical epic, which, however, found no worthier poet than the painstaking but insipid Silius Italicus, of the time of Nero and his successors. The desertion of Dido by Aeneas finds little sympathy with the modern reader, and the "pious Aeneas" appears in many respects a somewhat pitiful hero, but from the

VERGIL

ancient point of view his action was justifiable and even praiseworthy, due as it was to submission to the will of the gods. Vergil intends Aeneas to be the representative of the old Roman virtues, steadfastness of purpose, endurance, fidelity to a trust, courage, and reverence for the gods. It is to the last quality especially, together with his devotion to his father, that he owes his epithet of *pius*. To the Roman reader he was the champion of civilization against barbarism, represented by Turnus and his godless associates. So far as the form of the poem is concerned, we see in it Vergil's growing mastery of the heroic hexameter, and the results of his long years of study and training, and we may note an advance even in the progress of the work itself. It is the hexameter of the 'Aeneid' which deserves above all others the praise, "the stateliest measure ever molded by the lips of man."

But Vergil himself was conscious that he had not realized the ideal of his youthful days. In a letter to Augustus of the year 26, in answer to a request to see the poem or at least some part of it, he writes that he feels that he has been made to undertake so great a task. A few years later, however, he was ready to read three books to the emperor, including the 6th, in which he inserted the tribute to the young Marcellus, contained in verses 860-886. It is said that Octavia, who was present, fainted as Vergil finished his effective rendering of these beautiful lines, and afterward presented the poet with 10,000 sesterces (about \$500) for each verse of the memorial to her son. This story confirms in a general way the statement of Suetonius about Vergil's method of composing the 'Aeneid.' He is said first to have written a version in prose, and to have turned it into verse in no special order; and he seems to have followed the same plan in putting the finishing touches to his work. That he never completed the latter process is evident from various inconsistencies which appear in the poem, and more particularly, since absolute consistency is not demanded of a poet, from the numerous incomplete and less polished lines. It is shown also by his project of a three years' tour amid the scenes of his earlier books, and by the fact that on his deathbed he gave directions that the 'Aeneid' should be destroyed. This request was fortunately not granted, but Augustus had the work published, with only such revision as was absolutely necessary, by the poet's friends Varius and Tucca.

Besides the works of Vergil which are undoubtedly genuine, there have come down to us under his name a number of lesser poems: the 'Culex,' 'Ciris,' 'Moretum,' 'Diræ,' 'Aetna,' and the 'Copa,' together with a collection of shorter pieces, called 'Catalepton' (minor poems). Donatus and Servius attribute poems with these titles to Vergil; and Lucan, Statius, and Martial mention a 'Culex' of Vergil. It is certain that the 'Aetna' and the 'Diræ' are not his work, a fact which in itself discredits the testimony of the grammarians; as regards the rest there is a difference of opinion. The majority of scholars are inclined to regard nearly all these poems as spurious, assuming that they were collected and attributed to Vergil in the time of Nero, a view which disposes of all the ancient testimony, except perhaps that of Lucan. It is argued besides that some of

them are unworthy of the author of the 'Georgics' and the 'Aeneid,' an objection to which too much weight should not be given, while some, though not open to that charge, are in a manner wholly unlike that of Vergil as we know him. The arguments which have been based on certain metrical features of the poems seem to have little force. Just at present there is a growing tendency to claim these works for Vergil, and while the evidence in his favor cannot be said to be very strong, the same thing may be said of the contrary testimony. It is not likely that unanimity of opinion on this point will ever be reached.

Vergil's fame among his countrymen was immediate and permanent. He was hailed as the Roman Homer, and the efforts of a few jealous rivals to depreciate him were of no avail. His influence on the later Roman poetry was marked, notably on Persius, Silius, Statius, Ausonius, and Prudentius. The same thing is true of the later prose, for example, that of Livy and Tacitus. The 'Aeneid' was used as a text-book in the Roman schools as early as the days of Juvenal, and was made the subject of grammatical and stylistic commentaries by numerous writers. The writers of the decline not only imitated him freely, but introduced the custom of writing Vergilian *centos*, by arranging lines and half lines from his works in such a way as to give a sense entirely different from the original. This became a regular form of literary production, and they were even improvised. Among the Christians the works of Vergil escaped the general condemnation of the pagan literature, and he was believed to have received some measure of divine inspiration. From the Renaissance to the present time his influence on the poets of most European countries has been great. Dante, Chaucer, Spenser, Milton, and Tennyson, as well as many others, bear testimony to their acquaintance with Vergil; and his poems, especially the 'Aeneid,' have been translated into all the principal languages of Europe. It is only in comparatively recent times that the searching methods of modern criticism, especially in Germany, have brought Vergil's fame into question, and his detractors and his champions have in many cases shown equal lack of discrimination. The most common charges brought against him are those of inferiority to the Homeric poems and of lack of originality. The former point has already been discussed; in considering the latter we must bear in mind that the ancient ideas about literary work differed decidedly from those of our own day, and that wholesale borrowing from the work of one's predecessors was not considered to be at all improper. Furthermore Vergil had the power which all great writers have, of making what he borrowed his own; and, a thing which may be regarded as the supreme test, he not only imitated, but he was able to inspire imitation.

Besides the Vergil of history there is a mythical Vergil, singularly unlike the original. In comparatively early times the ancient biographers associated prodigies, prophetic of his future greatness, with his birth, and the adoption of his works by the grammarians as canons of usage gave him a reputation for vast learning. This feeling brought about the custom as early as the 2d century of consulting the *sortes Vergilianæ*, by opening the 'Aeneid' at ran-

VERGNIAUD — VERLAINE

dom and drawing an omen from the words of the first passage on which the eye fell, a custom which that work has shared only with the Homeric poems and the Bible. As early as the days of Silius Italicus we see traces of a Vergilian cult, for the younger Pliny tells us that Silius made annual pilgrimages to Vergil's tomb, and kept his birthday with more ceremony than he did his own. A special series of legends of a most grotesque character grew up among the common people of Naples, who with an entire disregard of chronology and of historical truth associated his name with many marvelous inventions and with numerous undignified and disreputable adventures. These two streams of tradition united and found their way into the romantic literature of the Middle Ages, and even into works of a more serious character. They have given us the mythical Vergil, the necromancer and ally of the powers of darkness. His name was in consequence associated in the popular mind with *virga*, a magician's "wand," which led to the spelling Virgilius, and hence to our Virgil.

As regards the spelling of the poet's name, the Latin form Vergilius is established beyond question by inscriptional and other evidence as the only one until the 5th century. In English, Virgil was the current form until comparatively recent times, when Vergil was introduced in common with a general reform in the spelling of Greek and Latin proper names; this is the usual form in Germany. In England and in this country both forms are used, as may be seen from the biographical list given below.

The first printed edition of Vergil was published at Rome about 1469. Since then there have been many editions in all countries. The standard critical text is that of O. Ribbeck, Leipzig, 1859-68 (containing the famous *prolegomena*) and 1894-5 (without the *prolegomena*). The best edition in English is on the whole that of J. Conington, revised by H. Nettleship (4th ed., 1881-3). Of translations, which are numerous, may be mentioned those of Conington of the 'Aeneid' into prose (1872), and into verse (1873); of R. D. Blackmore, the well-known novelist, of the 'Georgics' (1871); and of C. S. Calverly, of the 'Eclogues,' published in the Works (1901).

For further information consult: C. A. Sainte Beuve, 'Etude sur Virgile' (1870); W. L. Collins, 'Virgil,' in 'Ancient Classics for English Readers' (Philadelphia 1878); Nettleship, 'Ancient Lives of Virgil' ((Oxford 1879), and 'Lectures and Essays' (Oxford 1885); J. S. Tunison, 'Master Virgil' (Cincinnati 1888); R. Y. Tyrrell, 'Latin Poetry' (New York 1895); D. Comparetti, 'Virgilio nel medio evo' (2d ed., Florence 1896); (English translation of the first edition, 'Vergil in the Middle Ages,' by E. F. M. Benecke, London 1895); J. W. Mackail, 'Latin Literature' (New York 1895); G. Boissier, 'The Country of Ilorace and Virgil' (New York 1896); W. Y. Sellar, 'Roman Poets of the Augustan Age — Virgil' (3d ed., Oxford 1897); F. W. H. Meyers, 'Essays Classical' (London 1897); C. G. Leland, 'The Unpublished Legends of Virgil' (New York 1899); F. J. Miller and J. R. Nelson, 'Dido, an Epic Tragedy' (Chicago 1900).

JOHN C. ROLFE,

Professor of Latin Language and Literature,
University of Pennsylvania.

Vergniaud, vĕrn-yō, **Pierre Victorien**, French orator: b. Limoges 31 May 1753; d. Paris 31 Oct. 1793. He settled as an advocate at Bordeaux in 1781, and quickly gained a large practice, and was elected a deputy to the National Assembly in 1791. His eloquence and the charm of his personality soon made him the leader of the Girondists, but he cared little for political intrigue, and was rather the orator than the statesman. Representing in the Convention the department of the Gironde, he supported in the question of the king's trial, the proposal of Salle to make an appeal to the people. When the decisive moment came he voted for death, and as president it was his duty to announce the result. He opposed Robespierre and the party of the Mountain, but the Girondist party fell 2 June 1793, and on 31 October he was guillotined, the last of the 21 who died together. Consult: Lamartine, 'History of the Girondists' (1847); Vatel, 'Vergniaud: Manuscripts, lettres et papiers' (1875); Aulard, 'Les Orateurs de la Legislative et de la Convention' (Vol. I.): the Lives by Touchard-Lafosse (1848), and Verdière (1866); H. M. Stephens, 'The Principal Speeches of the Statesmen and Orators of the French Revolution' (1892).

Verhas, vĕr-hās', **Jan**, Belgian painter: b. Ternende 1834. He was educated in his native town and under Nicaise de Keyser, whose painting school at Antwerp he attended. Among his works may be mentioned: 'On the Landing Bridge at Blankenbierhe' (1885) and 'The Inundation.' He is one of the leading genre painters of the modern Belgian school.

Verjuice, a kind of vinegar containing malic acid and made from unripe grapes and from the juice of crab-apples.

Verkolje, Johannes, Dutch painter: b. Amsterdam, Netherlands, 9 Feb. 1650; d. Delft, Netherlands, 8 May 1693. He was a pupil of Jan Livens, who, finding him possessed of ability, set him to finish some uncompleted pictures of Ghorardt von Zeijl, with the result that later an original painting of Verkolje's was mistaken for one of Zeijl's. The influence of Livens is not shown in Verkolje's work. He settled in Delft in 1672. His work for the greater part consists of portraits, though he painted in his leisure various mythological and historical subjects. His work includes: 'Mother and Child,' Louvre; 'Lady and Trumpeter' (1678), Dresden Gallery; 'Cupid and Psyche,' Liechtenstein Gallery, Vienna; 'Vertumnus and Pomona' (1678), Worlitz Gallery; etc.

Verlaine, vĕr-lān, **Paul**, French poet: b. Metz, Lorraine, 30 March 1844; d. Paris 8 Jan. 1896. He was one of the earliest and most prominent of the so-called "Symbolistes." Among his first works were 'Poèmes Saturniens' (1865); 'Les Fêtes Galantes' (1869); and 'La Bonne Chanson' (1870). His next volumes 'Sagesse' (1881) and 'Les Poètes Inaudits' (1884), a volume of literary criticism, were followed by 'Jadis et Naguère' (1885); 'Romances sans Paroles' (1887); 'Amour' (1888); 'Bonheur' (1889); and 'Parallèlement' (1890); 'Dedicates' (1894); and 'Confessions: Notes Autobiographiques' (1895). He has been said to have introduced new possibilities of rhythm into French as a poetic medium. Consult: Lemaitre, 'Les Contemporains,' and the study by Morice (1894).

VERMEER—VERMIN

Vermeer, Johannes, yō-hān'nēs fēr-mār' (wrongly termed JAN VAN DER MEER OF DELFT), Dutch painter: b. Delft 31 Oct. 1632; d. there 15 Dec. 1675. He was a pupil of Leonard Bramer and of Fabricius and painted landscapes, architectural views, with special care in the painting of figures to people such scenes. He also produced some portraits and genre pictures. While during his lifetime he filled a large place in the contemporary art world and was dean of the Guild of Saint Luke at Delft, twenty years after his death he was almost forgotten, and omitted from Dutch and French 'Lives of Painters,' his very name up to 1816 being confounded with that of three other Dutch artists (Van der Meers). It has been ascertained that his father was Janssoon Vermeer, and written documents amply prove that his pictures were sold at a high price at a time when Rembrandt became bankrupt and poverty prevailed in Holland. One of Vermeer's finest works is 'A View of Delft' (now at The Hague); 'A Dutch Town' (crowded with figures) which was sold in 1872 for \$1,785; and among his genres may be mentioned 'The Musical Party'; 'The Guitar-player'; and 'Young Woman with her Servant.'

Vermejo, vēr-mā'hō, or **Bermejo**, an affluent of the Paraguay. See **BERMEJO**.

Vermes, vēr'mēz, a class-name in the system of Linnaeus under which he grouped as "worms" all the lower invertebrate animals except the arthropods (his "Insecta"). The varied components of this heterogeneous or omnibus group were first separated by Lamarck, and later have been still more minutely classified, as increased knowledge dictated until now the old Linnaean "class" is found to consist of nine phyla, and only a small proportion retains the name "worms," while "Vermes" has disappeared altogether as a scientific term.

Vermicelli, vēr-mī-sē'lī or vēr-mī-chē'lī. See **MACARONI**.

Vermiculites, a name given to quite a large group of micaceous minerals. The name is derived from the Latin *vermiculari*, "to breed worms," and has been applied because of the peculiar property of exfoliation which they possess. Some of the vermiculites exhibit this property in a very striking manner, unfolding when slowly heated, into curious curled filaments whose resemblance to worms seems more than fanciful. They are all hydrous silicates, formed by the alteration of the micas, chiefly biotite and phlogopite. They generally retain the eminent micaceous cleavage and pearly lustre of the original mineral. The laminae are usually flexible, but not elastic. Included in the group are the minerals vermiculite, jefferisite, and over a dozen others.

Vermiform Appendix. See **APPENDICITIS**.

Vermifuges. See **ANTHELMINTICS**.

Vermigli, vēr-mēg'lē, **Pietro Martire**. See **PETER MARTYR**.

Vermil'ion, the name given to a pigment of a bright red color, obtained from crystallized mercuric sulphide. It is generally prepared by subliming the ordinary sulphide.

Vermillion, S. D., city, county-seat of Clay County; on the Missouri River at the mouth of the Vermillion, and on the Chicago, Milwaukee & Saint Paul Railroad; about 34 miles north-

west of Sioux City, and 28 miles southeast of Yankton. It was settled in 1859 by a colony from the Eastern States, and was incorporated in 1877. It is in an agricultural and stock-raising region. The chief manufactures are flour, wagons, sash, doors, and blinds, and dairy products. There is considerable trade in farm products and live stock. The principal public buildings are the county court-house, the opera house, and the school houses. There are seven churches. The educational institutions are the State University (q.v.), a high school, founded in 1880; Saint Agnes' Academy, public and parish schools, and a public library. The two banks have a combined capital of \$100,000. The average amount of business annually is \$700,000. The government is vested in a mayor and a council of eight members, elected biennially. Pop. (1880) 1,496; (1900) 2,183.

Vermin, a relative term, comparable to "weed," signifying an animal obnoxious in some particular to human plans or operations. Animals may be regarded as vermin in one place which in another would be classed as innocent or even beneficial. Thus among English gamekeepers all the weasel tribe—stoats, polecats, and weasels—are typical vermin, because they kill game and eat eggs of preserved pheasants, etc., whereas in America they are regarded as useful fur-bearers; and in the United States rats, mice and the various "gophers" are the animals which mostly fall into the class. Rats and mice, especially field mice, may increase in such numbers as to destroy large quantities of grain, and thus become decidedly destructive vermin, while serious loss may also be caused to the farmer by hares and burrowing ground-squirrels, etc., especially in the Western States. Among birds, some of the hawks (see **HEN-HAWKS**) and owls are occasionally destructive to poultry and game; but as they feed chiefly on insects and mice, they are on the whole beneficial to man by repressing animals which are far more typically named vermin than themselves.

In the economy of nature a balance of power is rigidly observed, and in the maintenance of such a balance the so-called vermin play an important part. The lemmings (q.v.) present an instance of how the equilibrium is naturally restored. It is rarely needful or wise, at any rate with reference to birds and small mammals, for man to interfere when a case, like that of the prairie-dogs (q.v.) of the western United States arises; where repression is necessary, it is usually the result of previous human interference with nature's arrangements. Agriculturists are beginning to recognize that the birds which visit their fields are of extreme value in the repression of the insects and their larvæ which feed on the tender shoots of the grain. And even admitting that the fields may occasionally suffer from the visitation of common birds, the damage inflicted thereby is but trifling when compared with their services in repressing the insect species. Even the much persecuted mole has been shown by Darwin to be a thorough fertilizer of the ground, and the earthworm itself acts in this way also. Both animals, in fact, by their operations in turning over the soil, in bringing fresh layers to the surface, and in breaking the clods, tend to open up the ground, and thus to ensure favorable conditions for the germination of the seed. And

VERMONT

the despised and hunted rats may be shown, like the whelks and crabs of the sea, to play no unimportant part in nature's sanitary arrangements, by the wholesale destruction of offal and garbage in which they indulge.

Vermont, vēr-mōnt, "Green Mountain State" (Old Style French *Virdmōnt*, "a green mountain"), from Abbé de Vermont of France; one of the New England States; is bounded on the north by the province of Quebec, Canada; on the south by Massachusetts, on the east by New Hampshire, and on the west by New York. It has an area of 9,565 square miles, of which 430 square miles' surface is water; situated between lat. 42° 44' and 45° 0' 43" N. and between lon. 71° 33' and 73° 25' W. (3° 35' and 5° 20' E. from Washington); the State is 157.5 miles in length, width on northern border 90 miles, on southern border 41 miles, with irregular lines for its eastern and western boundaries,—average width 57.5 miles. The apparent discrepancy in the mean width is caused by the "Great Bend" in the Connecticut River. The geographical centre is in the western part of the town of Northfield, about 10 miles southwesterly from the capital, Montpelier, in Washington County.

Agriculture and Commerce.—Vermont is a State of diversified industries; agriculture and manufactures based upon natural resources being paramount. Ira Allen, in 1798, wrote: "You ask me if the Vermonters are good agriculturists? I answer, they have not made many geological experiments, nor have they occasion, as the soil, with a little cultivation, furnishes them with all the necessities of life in abundance, such as wheat, oats, rye, barley, etc. They have no necessity to introduce foreign grasses, where every hill and valley affords herbage spontaneously, and every plain permitted to remain a few months untouched becomes a meadow." While the development of the State's natural resources, and consequent increase of manufactures, has enlarged its commercial importance, Vermont has been and still remains an agricultural commonwealth. The relative importance of its products change with the generations. During the years 1850 to 1880 the breeding of Merino sheep was an item of great volume, and is still, but of lessening value. Morgan horses are known everywhere as a Vermont product. The wool clip in 1840 was reported at 3,699,235 pounds; in 1900, 1,334,253 pounds. Value of the dairy in 1840, \$2,008,737; in 1900, \$63,251,427. Oats and potatoes compared by the two periods were relatively equal; wheat and several other crops had almost disappeared. Corn had doubled in amount and value. In 1900 the value of all farm products was \$33,570,892. In 1902 the appraisal of 5,207,309 acres for taxation purposes was \$120,831,099; personal property, \$41,956,365.

Natural Resources.—There are four mountain ranges in the State,—the Green Mountain, which extends in a north and south direction, lying a little to the west of its geographical centre; the Taconic, nearly parallel, situated in the southwestern part, extending from the Massachusetts line north to Addison County; the Red Sandrocks, lying along the east shore of Lake Champlain, forming foot-hills to the Green Mountains; the Granitic elevations that are not properly a range, but extend southward from Canada for about two thirds of the "East Side."

Up to 1850 iron mines were a source of profit along the Taconics, gradually receding in importance, and the industry was abandoned about 1880. On the western slope of these mountains lies a belt of slate rock, from five to ten miles wide, and extending 30 miles south of West Castleton, situated in two States. The slate product of Vermont is second only to that of Pennsylvania; income in 1901, \$1,162,191,—quarries first extensively worked in 1853. In the counties of Bennington, Rutland, and Addison, marbles of pre-eminent quality and beauty of colors abound, the industry centring at Proctor, in Rutland County. Vermont supplies more marble than all the other States combined; value of the annual product, in 1900, being over \$3,000,000. The zone of activities for granite lies in Washington, Caledonia, Orange, Windsor and Windham counties; and, although first quarried in 1812, was not produced in large volume until within the past 20 years. All known colors exist (excepting red), and, recently, at Bethel a pure white deposit has been discovered. At Windsor there is a quarry of green syenite, "Windsor green granite." The income reported for 1902 was \$1,500,000, and must have nearly doubled in 1904. These deposits of iron, slate, marble and granite, as well as outcroppings elsewhere, prove that Vermont possesses these natural resources in practically illimitable quantities. Limestone, soapstone, talc, manganese, asbestos, mica, ochre, kaolin, and copper deposits (the last named centring in Orange County, and once an extensive industry), are among the other mineral resources of the commonwealth.

Manufactures.—In 1840 the output of granite and marble was \$62,515. Of the 33 industries noted by name, furnaces and forges, woolen and fulling mills, tanneries, potteries, grist and saw-mills, flouring and oil mills, figure as of importance. The total product of 312 grist, 1,081 saw, and 20 oil mills, was \$1,083,124. The aggregate value, produced annually, of the other three lines named, was nearly the same amount each. A comparison between these statistics of 1840 and those of 1810 shows material progress, although many kinds of domestic and other manufactures were disappearing,—potash, tallow candles, small arms, etc. In 1900 very complete returns were obtained,—4,071 establishments were capitalized at \$48,547,964; annual production, \$57,646,715; employees, 29,455; wage, \$12,237,684. "Lumber" stood at the head of the ten leading products in 1840 and in 1900.

Transportation.—Lake Champlain was early recognized as the State's great artery of commerce, and in 1795 Ira Allen's ill-fated (for himself) trip to Europe was undertaken in the interest of a ship canal to connect Lake Champlain with the Saint Lawrence. Subsequently a survey was made to connect by canal Lake Champlain with the Connecticut River as a waterway to Boston. The opening of the Champlain Canal, in 1823, affording improved facilities of transportation from the western part of Vermont, via lines of teams to Lake Champlain, the canal at Troy, N. Y., as well as similar overland freighting, soon caused artificial waterway projects to be abandoned. On the "east side" the Connecticut River continued to be a waterway to portions of New England until a later period. In 1808 the first steamboat was launched on Lake Champlain. In 1791 Capt. Samuel Morey of Fairlee had navigated a boat by steam power

VERMONT

on the Connecticut; afterward transferring the little craft to the waters of Lake Morey, near by. Railroads were chartered and surveys made prior to 1845, but that year construction was begun on the Vermont Central at Windsor; and 26 June 1848 the line was opened between White River Junction and Bethel. This road, as well as one on the west side (Rutland & Burlington), was completed to Burlington in 1849. In 1851 the north and south lines now in operation were nearing completion. Cross-country and short "feeders" had been built prior to the recent era of consolidation, so that now nearly all the Vermont railroads are operated by three trunk systems,—the Rutland, the Central Vermont, and the Boston & Maine companies. In 1903 the total mileage in Vermont was 1,054; bonded indebtedness and capital stock, \$44,091,519; gross earnings, \$10,320,000. Electric lines since 1893 provide convenient transit to city and country. In 1903 there were in operation over 100 miles of track; investment, \$4,450,000.

State Government.—The form of government, adopted in 1777, succeeding that of town and associated committees of safety, was very democratic in character. The legislature consisted of one house, with a town representation therein, and these members were elected by the "free-men" of the State. The executive authority was vested in a governor, lieutenant-governor, and twelve councillors, one duty of which was to review all bills before the representative body, and suggest amendments, prior to their final passage; but the negative power did not inhere in the "governor and council." With the modifications suggested by experience, this was the State government until 1836, when the present General Assembly of two houses,—Senate and House of Representatives,—superseded the original form. The town system of government and representation in the legislature has been continued under the amended constitution. The senate is the popular body, based upon population by counties, and consists of 30 members; the house comprising 248 representatives of cities and towns. In 1850 county officers were first elected by the people; in 1870 the legislature changed to biennial terms. The 14 counties in Vermont were incorporated on the dates named: Bennington, and Windham, 11 Feb. 1779; Orange, Rutland, and Windsor, 22 Feb. 1781; Addison, 17 Oct. 1785; Chittenden, 22 Oct. 1787; Caledonia, Essex, Franklin, and Orleans, 5 Nov. 1792; Grand Isle, 9 Nov. 1802; Jefferson, 1 Nov. 1810,—changed to Washington, 8 Nov. 1814; Lamoille, 26 Oct. 1835. The present constitution provides that State and County officers, members of the General Assembly, justices of the peace, and Representatives in Congress, shall be elected, biennially, on the first Tuesday of September.

The Judiciary.—One chief judge and six associate justices are elected, biennially, by the Legislature. These judges constitute the supreme court, three general terms of which are held, annually, at the capital. The semi-annual terms of county courts have each for a presiding judge, one of these supreme justices, and associated with him are two assistant judges, elected by the people of their respective counties. The Vermont judiciary has always been noted for its high standard, the soundness of its decisions, and clear-cut, logical deductions from the prem-

ises presented in pleadings; so much so, that a law library is not considered complete in the United States without a full set of volumes of the 'Vermont Reports.' The State, moreover, has pursued the policy of life-tenure, notwithstanding frequent elections, or during mental competency, insuring a stability of administration that does not always obtain where the elections of judges are by the people. The contrast between courts of this character and the "rough and ready" methods of dispensing justice to trespassers from New York in the "Grants," by Ethan Allen, *et al.*, is a paradox of Vermont's most wonderful history.

Religion.—The first legislature, in 1778, provided for the observance of the "Lord's day." Church and State, however, have been kept distinctly separate, and the nearest approach to any connection was made by the ultimate settlement of the "Glebe lands" controversy in 1823, whereby Vermont pays annually about \$3,000 to the Protestant Episcopal diocesan authorities. In 1900 there were 20 church organizations,—19 reporting 60,205 communicants, the Roman Catholic giving 57,000 as its population. It is stated that there are 26 Christian bodies in Vermont,—six not reporting in the census of 1900. The beginnings of the most important of these are tabulated below, the statement being reserved that services may have been held by missionaries and army chaplains prior to the erection of the chapels and churches named:

DENOMINATION	Place	Date
Roman Catholic,	Ft. St. Anne (chapel),	1666-68.
Roman Catholic,	Burlington (church),	1831.
Congregational,	Fort Dummer (chapel),	1724.
Congregational,	Bennington (church),	1762.
Baptist,	Shaftsbury (church),	1768.
Church of England,	Capt. Jehial Hawley's (house),	1770.
Protestant Episcopal,	Arlington (church),	1786.
Methodist Episcopal,	Circuit Riders,	1788-98.
Universalist,	Bennington (convention),	1795.
Universalist,	Barnet (church),	1803.
Free Baptist,	Strafford (church),	1794.

The Vermont Bible Society was organized 5 Oct. 1812; in 1816 it became auxiliary to the American Bible Society instituted that year.

Education.—The common schools of the earlier period were small republics within the towns, the prudential committees being analogous to the selectmen of the larger organization. These primary educators of the people have undergone many revisions of government and reorganizations during the past century and one half, and have been recently (1892) builded by the "town system" into one of the three steps of primary, secondary, and university training. The curriculum has been graduated and expanded so that the student is advanced logically through town and graded schools to the high school, and the college. The former course from the "little red school-house," and its "three R's," thence from private tutor and grammar school to the academy, and college, is indicative of Vermont's educational progress within 50 years. In 1840 there were 53 of these academies. In 1903, 17 were still in existence; the number of high schools (including academies that had reorganized as such), were 77; education to this point being free to every child.

The first attempt to plant the college in Ver-

VERMONT

mont soil was made by New York, as a conciliatory measure 17 Feb. 1772. The university settlement was to have been located in Kingsland, now the town of Washington, Orange County. "Kings College" foundation was an extensive land area at the height that divides the water-sheds of Lake Champlain and the Connecticut River,—an ideal spot of magnificent landscapes. Kingsland was also the county-seat of Gloucester County, under the New York regime. Subsequently an unsuccessful attempt was made to locate the University of Vermont on a similar height in the town of Williamstown. This university, incorporated 3 Nov. 1791, celebrated its centennial commencement in June 1904. Its foundation and location at Burlington became assured through much discussion, and was made possible by Ira Allen, who presented a petition to the legislature, 15 Oct. 1789, accompanied by a subscription of £5,643-12s., £4,000 of which he himself agreed to pay. Connected with it, to-day, is a medical department, and an agricultural college.—the university possessing an ample equipment. The other colleges are: "Middlebury," incorporated 1 Nov. 1800, located in a village of that name; and Norwich University, Vermont's Military Institute. The last named was incorporated 6 Nov. 1835, succeeding a scientific and military academy founded in 1820, and is now situated in Northfield. Two medical colleges, located in Castleton and Woodstock, respectively, flourished during the first three quarters of the 19th century, and were superseded by the medical department of the University of Vermont. These institutions have contributed many illustrious names to both State and nation.

State Finances.—The differences of opinion in relation to banks and systems of finance, prior to 1860, in the nation, exerted a reflex influence in this State, notwithstanding the financial exhibit made in earlier years. Yet, Vermont people have contributed in loans their full share toward the material progress of the "Great West." In 1903 their financial strength—as indicated by the summarized returns of 48 national, 22 savings banks, and 20 trust companies,—was:

National banking capital.....	\$ 6,460,000.00
National banks' surplus.....	1,628,581.45
National banks' circulation.....	4,636,594.00
National banks' deposits.....	12,121,581.71
National banks' resources.....	27,764,403.04
Savings banks' resources.....	
Trust companies' resources.....	48,377,839.27
Gain in savings institutions (10 years) ...	17,365,219.00
Gain in national banks' resources (10 years)	6,414,322.17

Charities and Correction.—Vermont has one State prison, one house of correction, and one industrial school. The first constitution provided for a State prison, but was not put into force until 3 Nov. 1807, and the building was completed in 1809. Up to 1842 of the six sentenced to life imprisonment, four had been pardoned,—one the first year, two within five years, and another six years subsequent to sentence. The "hard labor" of the convicts has been principally in manufacturing,—the first year 24 being employed at shoemaking. The prison and house of correction are governed by a State Board of Directors. The Vermont Industrial School was established for the education of criminal youth in 1865. The State maintains a hospital for the insane.

History.—In 1500-1600 the Iroquois Indians traversed a narrow strip on the east side of Lake Iroquois or Iroquet (Champlain), but their principal occupation was in Canada, and to the west and south. This tribe held to a tradition that the fertile valleys of Vermont were once the homes of the "Iroquets," and that great fields of maize (corn) had before time "waved in the winds," while the mountains abounded in game. At the time of the advent of white men this had become changed. The warlike Iroquois were enlarging their borders by conquest to the south and west of Canada, their original home; the no less warlike Algonquins, on the east of Vermont, were expanding, and the territory between the two had nearly lapsed into disuse, save for purposes of periodical conquest. It is known that the Saint Francis Indians of Canada, maintained settlements, later, in northern Vermont; that a village of the Mohegans existed in Arlington; the Coösucks on the Connecticut River, in and about Newbury, possessed the fertile "Interval Meadows" until about 1725; while to the south the Moheakunnuks (Stockbridge Indians) claimed a part of the State by cession from the colonial governments. The last named presented a claim for indemnity at Bennington in 1767, and a fund was subscribed by the pioneers to pay the Indians, "whenever proofs should be forthcoming." In 1779-81 a grant of the township of Marshfield was made in settlement by Vermont. In 1798 the Cognawaga tribe of the Iroquois League, presented a claim to the State for "more than 2,000,000 acres of land," valued at nearly \$90,000. This claim was considered by the legislatures of 1798-9, 1812, 1820, 1854-5, 1857, and 1874. In 1812 the sum of \$100 was voted as a *present*, and an additional \$100 to defray the expenses of the Cognawagas present. The conclusion reached in 1874, that the petitioners had no legal standing, was based upon the opinion that if a claim ever existed it was "extinguished by the treaty between France and Great Britain in 1763, and by the treaty between Great Britain and the United States in 1783." This was substantially the decision of New York, where this claim for indemnity had also been pressed, on the plea that the State's alleged eastern boundary extended to the Connecticut River.

Settlement by Whites.—France was the first claimant of Vermont by right of discovery. In 1684 a map published in Paris included about three quarters of the territory in "New France." The southern boundary of this possession was drawn from Penobscot, Maine, to the southern extremity of Lake Champlain, and thence to the Mohawk River, which it crossed a little above Schenectady, N. Y., and comprised all the region on the north drained by the Saint Lawrence. New France to the northeastward had been partially explored by Cartier in 1535, and the city of Quebec was founded, under Intendant Samuel de Champlain, in 1608. The following summer an expedition of French and Indians, commanded by Champlain, started southward. It passed from the Saint Lawrence River up the Richelieu into Lake Iroquois, to which the commander gave his name, and proceeded to a point near Ticonderoga. This was the first visit of white men to Vermont. The company entered the lake, on its outward passage, 4 July 1609, and as the mountain landscape burst into view, Champlain exclaimed: "*Voila les Verts Monts*,"

VERMONT

behold the green mountains,—naming the range as well as the lake. The object of this voyage was to assist the Canada Indians in their wars with the Iroquois, the results of which became a series of merciless depredations upon all white settlers on the frontiers of New England until about 1760. An example illustrates the entire century and one half of Indian history: The introduction of firearms and the killing of Iroquois braves transformed these Indians into invaders. The French on the north and the Dutch on the south furnished the arms, and numbers were not always an assurance of safety. A Jesuit missionary, bearing the cross as an emblem of peace, visited Lamothe island, now called Isle La Motte, in Lake Champlain. He met the Iroquois and other tribes of the subsequent League, was made a captive, together with his company, and all suffered merciless tortures such as only American Indians ever conceived. This led to the erection of Fort Saint Anne by French troops,—on this island in 1664,—commanded by Captain de La Motte, and the adoption of a policy of military outposts wherever settlements were made. In 1730 a few families from Canada located at Chimney Point in Addison County and built a stockade for protection; the next year Fort Frederick was established, afterward named Crown Point; and Ticonderoga was fortified by the French in 1755 (at first called Carillon),—the last two on the New York side of Lake Champlain. Meantime the Intendants of New France had made grants on both shores of the lake, but these were sparsely settled if at all, and were finally abandoned in 1759. Previously, however, French settlements had existed at Windmill Point in Alburg, on the Missisquoi River in Swanton, and in Colchester near the mouths of the Lamoille and Winooski rivers.

To the south a similar system of colonization had obtained. The exploration of the Hudson River,—the same summer as that of Lake Champlain,—and a settlement made at Albany, N. Y., gave an impulse to expeditions northward. The advancing operations of the French, in 1699, were met by the English of New York, and a company of whites and Indians from Albany that year erected a stone fort at Chimney Point, but it was not permanently occupied, and was abandoned to the French in 1731. The Deerfield "raid" and other Indian depredations, resulted in the building of Fort Dummer at Brattleboro, by Massachusetts in 1724; and, in 1744, of another fort, situated between North Adams and Williamstown (indifferently called "Massachusetts" and "Hoosick"), for better protection against the French and Indians from Canada. The settlement about Fort Dummer was the only one, under the protection of military outposts in Vermont, to become permanent.

The New Hampshire Grants.—Immediately prior to the events following 1760, two issues were presented, which made the colonization of the State possible, and led up to the important history made on the territory comprising the New Hampshire Grants. Hitherto, since the discovery of the lake by Champlain, especially during the French and Indian War, that waterway and the Indian trails had been the highways of contending forces,—the French and hostile Indians on the north, and the English and like savage allies on the south. Detachments swept

both the waters and the forests,—at times victory perching upon one banner and then the other,—where in addition to the usual casualties of war, hundreds of captives went to martyrdom through gates of the most fiendish treatment savage ingenuity could invent, oft repeating the first instance of Father Jogues, the Jesuit missionary, on Isle la Motte. At length an expedition was fitted out from Crown Point, in September 1759,—commanded by one Major Rogers,—to strike a decisive blow against the Saint Francis Indians in Canada. Major Rogers reached the principal Indian village 5 Oct. 1759, and was so successful that "he destroyed their power, and took away their courage." This in great part ended Indian raids on the settlers in northwestern New England.

The other great issue was created by a conflict of jurisdiction between the governors of New Hampshire and New York. On 17 Nov. 1749, Gov. Benning Wentworth addressed a letter to Gov. George Clinton, stating that the western boundary of New Hampshire extended to a line running from the western limits of Connecticut on Long Island Sound northerly to Lake Champlain; or to 20 miles east of the Hudson River. The reply of Gov. Clinton, of New York, under date 3 July 1750, was to the effect that New York's eastern boundary was the Connecticut River. This controversy was submitted to the English king, whose answer (delayed until 20 July 1764) sustained New York, although for years the line between the two colonies had been understood officially, both in England and America (and so placed on maps), to be the one designated by Gov. Wentworth of New Hampshire. In 1740 a long-pending dispute between New Hampshire and Massachusetts had been adjudicated on the line of the present boundaries of those States; the treaty between France and England in 1763 settled the northern boundary, so that the east and west borders were the points involved. Meantime, during the French and Indian War, and up to the proclamation of the king's decree, in 1765, Gov. Wentworth had issued grants of townships in what is now Vermont, to the number of 150,—the first, Bennington, bearing date 3 Jan. 1749, and the last 3 Nov. 1764. Of these, 17 were dated in July 1761; 22 in June 1763, nearly every month being represented during the 15 years. Towns coming within the New Hampshire jurisdiction from Massachusetts and Connecticut by the settlement of 1740, Gov. Wentworth likewise re-chartered, and the period of the greatest activity in this respect was from 1761-4, when townships for the entire territory west of the Green Mountains were laid out; and in 1761, also the major part of those on the west banks of the Connecticut River. It is explained that these charters cost from \$100 to \$250 each; and that \$700 were obtained, by the colonial governors, for many of the grants of six miles square. The names of the grantees indicate that syndicates procured in blocks many of these chartered townships, affording a very suggestive basis for revolution between rival claimants, or litigation by *bona fide* settlers to gain valid titles. Each town was divided into 60 shares, one of which, it was stipulated, should be reserved for the "Society for the Propagation of the Gospel in Foreign Parts,"—a London Church of England corporation still in existence,

VERMONT

—one share for the first settled minister, one for educational purposes, and there were other minor reservations attached to every charter. The government created was the New England town meeting system.

In 1761 immigration became active from the States of Connecticut and Massachusetts,—at first to Bennington, and afterward to the Connecticut River Valley, augmenting the sparse settlement about Fort Dummer. By the time the decree of 1764 was published, placing the settlers of the "Grants" under the government of New York, a considerable territory had been taken up; and acquiescence to it might have been possible but for the retrospective interpretation of one clause,—that New York had always held lawful jurisdiction. Lieut.-Gov. Colden thereupon (in council) declared the Wentworth Grants "null and void," treating the settlers thereon as trespassers,—not only under this decree of George III., but asserting an earlier title under the charter of Charles II. to the Duke of York in 1664,—and proceeded to grant charters anew to these lands. This precipitated a long and bitter controversy, which ended only when the independent State of Vermont became strong enough to assert its rights, and the dark days of the war for independence in the colonies overshadowed local events like these. This duplication of charters, to lands owned by the pioneers, was fully as odious as the "Stamp Act," and contributed toward the throwing off of a corrupt Colonial government. Gov. Wentworth is said to have become wealthy by reason of his charter-fees; Gov. Clark in New York, between 1736 and 1743, is alleged to have made £100,000 by reason of his office; Gov. Clinton (in ten years) is accredited with an accumulation of £84,000.

In its incipency, the clash of authority over the territory of the "Grants" was not singular. It was the experience of many other sections of the colonies, and is explained by the suggestion relative to the sale of charters and the reckless stipulations therein as to the surveys and boundaries involved. Not another controversy, however, carved out a *rugged* commonwealth like Vermont. In November 1766, the grantees of New Hampshire having paid the crown for their lands through Gov. Wentworth, and finding that redress could not be obtained of New York, appealed directly to the king, George III. Samuel Robinson, Sr., of Bennington, went to England, and his mission was, in a measure, successful. Under date of 24 July 1767 the issue of grants to lands already chartered by New Hampshire, was forbidden; but New York pretended the edict related only to patents thereafter to be issued. Nevertheless, a period of rest ensued, and 9 Dec. 1769 the governor of New York was further informed by the British ruler that the prohibition extended to "Any grants to be made of lands annexed to that colony by His Majesty's determination of the boundary of New York and New Hampshire." This was reaffirmed in 1771, and the order was never repealed. Still the conflict continued. In 1768 and 1770, respectively, New York organized Cumberland County on the south, and Gloucester County on the north, east of the Green Mountains; in 1772 Charlotte County on the north of the west side, leaving the south part of the present Bennington County within that of

Albany. These civil divisions were recognized until after the authority of George III. himself was repudiated by the inhabitants of the Green Mountains.

As far as the leaders and landholders of the "Grants" were concerned, it became a fight for their *lives*, as well as their *homes*, for New York eventually "set a price upon their heads." The "period of rest," to which reference has been made, was under the administration of Sir Henry Moore, governor of New York,—the two years immediately prior to his death, 11 Sept. 1769. He was succeeded by the return to power of Lieut.-Gov. Colden who re-opened the era of conflict. Ejectment suits were brought by citizens of New York, in the courts of that colony, to dispossess the settlers under the Wentworth charters, and to enforce the plaintiffs' rights under those of New York. In connection with an ejectment suit against James Breckenridge (modern orthography Breckenridge), a pivotal historical event occurred. Breckenridge owned a farm outlying both banks of the Walloomsac River, in Bennington, and had made extensive improvements before the claim set up in the legal proceedings became known. The pleadings stated that New York, in 1739, had granted a charter for the township of Walloomsac, and that defendant's land was situated therein. Walloomsac was an irregular and carelessly bounded tract of 12,000 acres, a part of which lay in the Bennington of the Wentworth charter. The joint issue of the charter of Charles II. and that of George II. was news to the settlers, and was urged to make a test case, by land speculators, who had acquired this property at a nominal value received. The first service was made on Breckenridge 19 Oct. 1769, coupled with the "quit rent" process. This was *peacefully* resisted, although Breckenridge and his neighbors were armed. This was the *first* act of revolution in the American colonies. On 19 July 1771 a final and equally unsuccessful attempt to dispossess Breckenridge was made by Sheriff Ten Eyck of Albany, at the head of a posse of 400 men. Both sides were armed, but the New Yorkers, not officials, were so much in sympathy with the settlers on the "Grants" that not a gun was fired. Vermont historians agree that *here* was the genesis of the future State. None of the leaders of the succeeding days had part in it, unless it may have been Seth Warner, who was a neighbor of Mr. Breckenridge. The citizens of Bennington, in town meeting, had decided that nothing should be surrendered to the plaintiffs in these suits until the king had passed upon the rights of the defendants; and to protect themselves additional military companies were recruited,—*"The Green Mountain Boys"* of song and story, commanded by Col. Seth Warner.

Founders of the Commonwealth.—The stormy scenes attending the wholesale land-litigation of the years 1769-76, requiring constant defense in the New York courts on the part of the inhabitants of the "Grants," drew to their support the sturdy men essential to maintain an exposed position against adverse judgments,—even to the force of arms. These leaders were intensely loyal to the welfare of the colonies as a whole, and to their own vested charter-rights in particular; and in this they shared the sympathy of the larger number of their New York neighbors. This had been in evidence at "Breckenridge

THE BENNINGTON BATTLE MONUMENT.

VERMONT

farm," in 1771. Five personalities stand out in vivid bas-relief: Ethan Allen, Thomas Chittenden, Ira Allen, Seth Warner, and Dr. Jonas Fay. The issue had been drawn between the New England conception of civil liberty, with small, free land owners, and the English system of royal landholders, non-residents, entailing tenantry; and the "Grants" teemed with leaders and settlers thoroughly imbued and able to defend the American principle. The *casus belli* was unmistakable. Ethan Allen possessed the bold, persistent, vigorous character essential to his sphere of influence. But for him Vermont might have acquiesced to apparently overpowering environment when, rejected by the Continental Congress and opposed by contiguous States, instead of yielding, the "Grants" became an independent commonwealth able to stand upon its own foundation. Thomas Chittenden was a resourceful personality whom convulsions in the body politic could not swerve from his line of duty and fortuitous circumstances had no power. What he did not possess of cultivated talent was more than counterbalanced by a highly developed common-sense that often won where more scholarly men might have failed. His long incumbency of the chief executive's chair (governor from 1778 to 1787, and 1790 to 1797) fully establishes this estimate of his character. Ira Allen was the diplomat and statesman of the quintette. Of him the first governor

Court-House, Westminster.

affirmed, "There would have been no Vermont if there had been no Ira Allen," and Gov. Chittenden was a competent judge of his associate for a generation. The "Haldimand incident" is a perpetual monument to his skill in diplomacy, and for which the British undoubtedly retaliated in the "Olive Branch (ship) litigation," eight years ending in 1804. The Allens were "fighters" and Seth Warner proved himself a valuable compeer. He possessed Ethan Allen's courage, without rashness, and he was undaunted yet cautious in emergencies. Dr. Jonas Fay was clerk of nearly all the meetings, and secretary of the conventions of the New Hampshire Grants; member and vice-president of the Council of Safety. From the records in his own handwriting (recently discovered, 1904) is taken much that appears in quotations below. He was the author of the "Declaration of Independence" of Vermont, and in his quiet way rendered distinguished and invaluable service to his State and country. These leaders believed the settlers of the "Grants" held legal titles to their homes and

farms, and there is contemporary evidence that this belief was also personally shared with them by William Tryon, colonial governor of New York, 1771-8.

Revolutionary Activities.—But the controversy was not confined to the "west side," the settlers of the "Grants" east of the Green Mountains had been made the subjects of similar oppression. The New York court for Cumberland County, in particular, had been aggressive, and the state of public sentiment was portentous of coming revolution. On 13 March 1775 an event occurred which impelled a union of all the patriots. Judge Chandler was to have held court at Westminster on that day. The settlers gathered, unarmed, took possession of the court-house [see illustration, from a wood-cut engraved from a drawing by Daniel Hall. The building was demolished in 1806], and, by peaceable means, proposed to prevent the assembling of the court and officials. They were "fired upon" by a sheriff's posse, collected to disperse them, and William French fell, mortally wounded,—“the proto-martyr to the cause of American liberty.” Several others were wounded, and another, Daniel Houghton, also fatally. The attacking party claimed the patriots fired first, but none of the royalists were injured. A long pamphlet and correspondence discussion afterward failed to impeach the credibility of this version of the affair known as the "Westminster Massacre." At this time the governments of the towns in the New Hampshire Grants consisted of "Committees of Safety"; and, on 11 April 1775, a convention of these, held at Westminster, adopted a remonstrance to the court of Great Britain, and asked "To be taken out of so oppressive a jurisdiction and either annexed to another jurisdiction, or incorporated into a new one." Ethan Allen was active in this convention. He was the organizer commensurate with the exigency. During the three or four prior years he had combined the public activities of the settlers into councils of safety and military organizations, imparting to them so much of his own zeal and confidence as to present the most effective and reliable patriot bodies,—civil and military,—of any which existed in the colonies. This is the key-note to the victories attendant on the Green Mountain arms. It explains the capture of Ticonderoga 10 May 1775 (on the day the Revolutionary Congress assembled) and the part taken by the "Green Mountain Boys," at Bennington 16 Aug. 1777. Generalship of this character would not neglect the commissary department, and the Continental store-house at Bennington, filled with supplies, was a reality. Its capture by Col. Baum's detachment would have enabled Gen. Burgoyne to re-write the entire history of his ill-starred expedition. Referring again to Ticonderoga and its bloodless capture, there may exist honest doubts as to what honors may have been due to Benedict Arnold, but there was none as to Ethan Allen and Seth Warner. Supported by Warner and his "Green Mountain Boys," Ethan Allen entered the fortress at the head of the command,—“side by side” with Arnold, as he wrote, 11 May 1775.—and the demand for surrender, “In the name of the Great Jehovah, and the Continental Congress,” twice repeated, was made by Allen upon Commandant Delaplace. Arnold's commission to command these troops had been repudiated.

VERMONT

The next day Warner reduced Crown Point. Making peace among themselves, Arnold and Allen swept Lake Champlain of hostile craft, troops from Connecticut occupied the forts at Crown Point and Ticonderoga, and American patriots thus obtained, within a week, control of the entire waterway. These events, so quickly following Lexington battle, filled royal governmental circles with astonishment. Gov. Colden, of New York (who had temporarily returned to power), reported to the British ministry: "The only people of this province who had any hand in this expedition were that lawless people of whom your lordship has heard much under the name of the Bennington mob," referring to the affair of "Breckenridge farm." The "Green Mountain Boys" disbanded and Warner was given the command of a regiment,—composed largely, however, of the same men,—enlisted under the Continental Congress. An "irony of fate" attended its fortunes in that the regiment was mainly engaged in the defense of New York; and yet it should be stated that the State of Vermont, after its organization, paid the entire expenses of these soldiers. Not being recognized as a commonwealth by Congress, the independent State not only defended itself from the British, but materially assisted the general cause of National independence.

It is probable that the "new" jurisdiction contemplated by the patriots at Westminster, 11 April 1775, had reference to a royal colony to comprise the New Hampshire Grants west of the Green Mountains and all the territory north of the Mohawk River and east of Lake Ontario, with its capital at Whitehall, N. Y. (Skeensborough), of which Philip Skene should be governor. Ethan Allen, William Gilliland, Jehial Hawley of Arlington, and others were interested, but the commencement of the Revolutionary War at Lexington, Mass., 19 April 1775, eight days after the convention, changed these plans. These people, essentially independent, accustomed to obey only the orders and decrees emanating from their own conventions and cherished town meetings, proceeded to call another convention. This was held,—like the one of 26 July 1775, "to raise troops," etc.,—at "Mr. Cephas Kent's in Dorset"; and, unlike its two predecessors in the "Grants," was "duly warned" by a committee. The warrant recited six articles, the last of which stated: "To see whether the convention will consent to associate with New York, or by themselves, in the cause of America." The convention assembled 16 Jan. 1776, and authorized the preparation of a remonstrance and petition to the Continental Congress. These were presented and adopted at a subsequent convention, 24 July 1776, assembled also at Cephas Kent's, which recapitulated the late events in the New Hampshire Grants, including the king's decree of 1767, and praying "not to be put under the jurisdiction of New York, but allowed to remain in that of New Hampshire." The situation was fast becoming intolerable, and the warlike rumors of military movements were alarming; therefore the following declaration of loyalty was signed by the entire convention, with "only one dissenter":

We the subscribers, inhabitants of that district of land, commonly called and known by the name of the New Hampshire Grants, do voluntarily and solemnly engage, under all the ties held sacred amongst mankind, at the risque of our lives and fortunes to

defend, by arms, the United American States against the hostile attempts of the British fleets and armies, until the present unhappy controversy between the two countries shall be settled.

At an adjourned convention, held at the same place, 25 Sept. 1776, a covenant or compact was formulated,—58 delegates present and "Cumberland and Wilmington or Draper by letter," representing 35 towns, 10 of which were on the "East side,"—that still further raised the framework of the future independent State. Ethan Allen was a prisoner with the British. It was voted unanimously: "That suitable application be made to form that district of land, commonly called and known by the name of the New Hampshire Grants, into a separate district." A "Committee of War" was appointed to act as the government, civil and military, *ad interim*, namely: Simeon Hathaway, Jonas Fay, Nathan Clark, Joseph Bradley, Martin Powell, Cephas Kent, Joseph Bowker, Joseph Woodward, Nehemiah Howe; 15 Jan. 1777 following were added from the "East side," Thomas Chandler, Stephen Tilden, Ebenezer Harrington, Joshua Webb, Dennis Lockeland, Jotham Bigelow, Thomas Johnson, Elijah Gates, Nicholas White. At the October convention, and the January succeeding, Ira Allen served as clerk,—both held at Westminster. Events had moved rapidly in the "Grants" or in the embryonic commonwealth. The people of the Green Mountains, loyal to freedom from Great Britain and discredited in their contention with contiguous territory, were ready to take an independent step. Accordingly, at Westminster, 15 Jan. 1777 in the Court-House, the following was promulgated:

This Convention (whose Members are duly Chosen by the Free Voice of their Constituents in the Several Towns on the N. Hampshire Grants) in public Meeting Assembled, in our own names and in behalf of our Constituents, Do hereby Proclaim and Publicly declare that the District of Territory comprehending and usually known by the name and description of the N. Hampshire Grants of Right ought to be and are hereby declared forever hereafter to be considered as a Separate Free and Independent Jurisdiction or State, by the Name and to be forever hereafter called and Known and distinguished by the Name of New Connecticut alias Vermont, and that the Inhabitants at present, or that hereafter may become residents, either by procreation or Emigration within said Territory shall be entitled to the same Privileges, Immunities and Infranchisements as is Allowed, and on such conditions and in the same Manner as the present Inhabitants in future shall or may enjoy; which are and forever shall be considered to be such Privileges and Immunities as the free Citizens, and Denizens which may at any time hereafter be allowed to any such Inhabitants of any of the Free and Independent States of America, and that such Privileges and Immunities shall be regulated in a Bill of Rights and by a form of Government to be established at the next Session adjourned of this convention.

At the adjourned session, in the "meeting house," at Windsor, 4 June 1777, the State was entitled Vermont only, it appearing that another "district" lying upon the Susquehanna River had been called "New Connecticut." Official history is silent as to the origin of this name. The commonly accepted hypothesis refers it to Intendant Champlain's exclamation, "*Voilà les Verts Monts*," when he first caught sight of the mountains. Another attributes it to Dr. Thomas Young, of Philadelphia, who, 11 April 1777, wrote a congratulatory letter recommending a draft of the Pennsylvania constitution,—which was an adaptation itself of the William Penn charter,—as a suitable basis of that proposed by the committee for the free and independent State he therein called "Vermont." But where did Dr. Young

VERMONT

procure the name? It is now known that Abbé de Vermont was reader to Marie Antoinette, and because of this Saint John de Crevecoeur wrote Ethan Allen, 17 July 1785, asking that several counties receive French names, "as Vermont is entirely French." Saint Johnsbury was named after this eminent literator. Another claimant was the Rev. Samuel A. Peters, DD., LL.D., the first Church of England clergyman to visit this district, and who was afterward chosen Bishop of Vermont, but never consecrated. Dr. Peters, in October 1763, climbed a high mountain in the "Grants," where the waters of Lake Champlain could be seen on the one hand, and those of the Connecticut River on the other, and broke a bottle upon a rock, naming the territory "Vermont," dedicating it to God. Little credence was given to this alleged incident, because of the repeated failures to find such a location. Mounts Mansfield and Camel's Hump, and Knox Mountain in Orange County, were each ascended without results; but, in 1880, Spruce Mountain in Plainfield was selected for an ascent from Bradford, where the Peters family settled, and the conditions found at the summit served to confirm the Dr. Peters' claim.

The preamble to the Vermont Declaration of Independence, reciting the grievances of the patriots and their sufferings, entailed by the British government, is a monument to the 72 Vermonters, who again swore fealty to the National cause. The Continental Congress, while failing to give them any satisfactory response to numerous petitions, began to recognize its Green Mountain troops as reliable allies, and the mili-

Constitution House, Windsor.

tary was receptive of honors. Warner had been promoted to colonel, and others prominent in Vermont affairs were possessors of commissions in the Continental line. But the days were dark for the country. Outside the camp of Gen. George Washington, and this circle of Green Mountain patriots, the possibilities of American liberty was a lamp dimly burning. Gen. John Burgoyne, with an army deemed invincible, was marching southward from Canada. He was met by the Vermonters so aggressively that he likened them to "a gathering storm on my left." The convention to adopt a constitution for the independent State met in the "Old Constitution House" at Windsor 2-8 July 1777 in the shadow of this environment. The constitution had been read and adopted, "section by section," and was about to be put upon its final passage, when news came, 8 July, of the disastrous situation in the Northern Department. The result at Hubbardton the previous day was unknown, but many families of the representatives lived in the route

of Burgoyne's advancing and victorious army. The motion to immediately adjourn was about to be carried, when the heavens, as if to complete the British general's metaphor, added the artillery of a terrific thunder-storm as a concomitant. The enforced delay caused a sober second-thought, and the business of the convention was completed before the hurried adjournment and departure occurred.

A "fast" had been observed 18 June 1777; but disaster following disaster to America, still accompanied the British progress south. Ticonderoga and Crown Point, considered hitherto as commanding Lake Champlain, had fallen, but at Bennington the tide of battle turned. Here the combined forces of Massachusetts (Berkshire County), New Hampshire and Vermont, under Gen. John Stark, won the day; and it was Warner's regiment, fresh from its defeats at the north, and Hubbardton in particular, which arrived just in time to save the field. Stillwater 19 September and 7 October, subsequently, led up to Burgoyne's surrender at Saratoga 17 Oct. 1777. This series of successes, one of Cressey's 15 pivotal points of history, was thus written in favor of liberty.

A monument of dolomite, obeliskal in character, marks the site of the Continental storehouse, and commemorates the Battle of Bennington, the field of which forms a portion of the landscape visible from its look-out room. It rises from an elevation 250 feet above the Walloomsac River Valley, 301 feet 10.5 inches; base, 37 x 37 feet,—the most imposing strictly battle monument in existence. The cost, \$100,000, was contributed by the three States involved in the engagement, by subscription, and \$40,000 by the National government; erected 1887-91 A.D., by the Bennington Battle Monument Association, a Vermont corporation. In the valley is located the Soldiers' Home of the State.

The convention at Windsor, before adjournment, created a "Council of Safety" and endowed it with all the powers vested in the constitution just adopted. It was the *acting* executive of Vermont during the Battle of Bennington. This council of 12 men was constituted: by Thomas Chittenden, president; Jonas Fay, vice-president; Ira Allen (to 6 Sept. 1777), Joseph Fay (from that date to 12 March 1778), secretaries; Heman Allen, Jacob Bayley, Timothy Brownson, Benjamin Carpenter (succeeding 24 Dec. 1777 Benjamin Spencer, a Tory), Jeremiah, and Nathan Clark, Moses Robinson, Paul Spooner. This provisional body was dissolved 12 March 1778 when the regular State government was inaugurated. Four days later the first legislature divided the State into two counties, Bennington on the west and Unity on the east, the Green Mountains becoming the line of official demarcation. On the 21st the name "Unity" was changed to Cumberland, and that county was divided into two "shires" by the "ancient line,"—the Westminster shire and the Newbury shire. Bennington County also was given two shires,—Bennington and Rutland. A readjustment of county and town lines, thus begun, was continued until permanently established.

The Haldimand Incident.—This was a feature of the American Revolution that has received various interpretations. Its ostensible purpose was an exchange of prisoners, Vermont becoming the *via media* between the commanders of the

VERMONT

hostile armies. Its effect was to keep a powerful British army inactive,—for more than four years,—in Canada on the north, and to wring from the Continental Congress a quasi-recognition of the independent commonwealth. Eight Vermonters only were in the *secret* motives, namely: Ethan Allen (lately returned from his sojourn in a British prison), Ira Allen, Governor Chittenden, Moses Robinson, Samuel Safford, Timothy Brownson, John Fassett, and Joseph Fay. Ira Allen, the diplomat, was the moving force, Governor Chittenden became the trusted counsellor of both parties, and Ethan Allen's boldness maintained *in statu quo* the severe criticisms, suspicions, and charges of double dealings throughout the period, extending from 11 Jan. 1779 to 25 March 1783. To Great Britain was held out the hope that Vermont would become an English province, but the Americans were more difficult of management. Congress had gratefully acknowledged the service of Vermont during the Burgoyne invasion only to recede, and Ethan Allen promptly disbanded the Green Mountain militia, carrying consternation into the settlements exposed on the northern frontier, and perplexity to the commanders of the patriot army. The threatened dissolution and partition of Vermont among the States of Massachusetts, New Hampshire and New York was met by the annexation 5 April 1781 of 35 towns in New Hampshire, extending eastward to the "ancient Mason line"; and 15 June, following, of 12 contiguous districts in New York, formerly claimed by New Hampshire, known as the "East and West Unions." These boundaries were insisted upon by Ethan Allen and accorded by the British. The towns annexed promptly sent representatives to the Vermont legislature and the independence of the enlarged State was unquestionably maintained. The militia was again mobilized, it being significant that the first offer of protection was made by Ethan Allen to New York, and Congress was perfectly well satisfied to enjoy whatever advantages thus inhered to the patriot cause.

Encouraged to believe that Congress would recognize Vermont if the "East and West Unions" were surrendered, on 22 Feb. 1782, in the face of protests by the towns affected, the legislature reduced the State's boundaries to the present limits; but the National body postponed action.

Admission to the Union.—The number 14 is talismanic. Vermont was an independent State 14 years, having been admitted as the 14th, 4 March 1791, and it took 14 years to perfect the union of the 13 original colonies. The financial condition at the close of the war was ideal. Vermont owed nothing, while its associates of the Revolution were deeply involved. The State, at the time of its admission, had settled with New York, paying \$30,000; had paid the troops raised within its borders to defend the commonwealth,—Continental as well as local,—included in its frame of government the coinage of money; a postoffice department, established in 1783, under a postmaster-general; and possessed the entire activities of a sovereign republic. Vermont's system of finance had been devised by Ira Allen. Money was *first* raised (of all the States) by confiscation of the estates of the royalists; afterward by constitutional taxation. In 1787 Ira Allen's accounts as treasurer had been audited.

The State government's total revenue from March 1777 to October 1786 (both years inclusive) was £327,947-9s-1d. Ten financial years averaged £3,279 per annum. No wonder, eventually, overtures for union were made by Congress. Strange as it may read of a liberty-loving people, the Vermont Constitution was never submitted to a vote of acceptance by them.

Ethan Allen did not live to see the consummation of his hopes. He died 12 Feb. 1789, in Burlington, where a Tuscan column of granite, 42 feet in height, with a base suitably engraved, marks his resting place. It was authorized by the legislature of 1855.

The settlers of Vermont had been of New England origin, and largely from Connecticut. Their ideas of freedom, crystallized in the "Bill of Rights," had been the expression of *principles*, founded upon sincere convictions; they had struggled to attain statehood through sacrifices that were heroic because these affected the dearest spot to freemen,—the home. The constitution partook of several unique elements, chief of which was that human slavery should never be legal, and it was not strange immigration of the right sort poured into the State, and its territory rapidly opened up to settlement. The financial situation was attractive to men of means, and the commonwealth grew apace in all that tended to influence, and the sterling worth for which Vermont has ever been noted. This accounts for its political "one-sidedness,"—after the two types of citizenship, indigenous to all civilized peoples, have crystallized into two opposing camps or parties,—and the commanding position the State has taken in National affairs. The isolation forced upon the people by their early struggles accounts for the insularity of the earlier trade relations, these being with Canada, principally, rather than with the United States. The War of 1812, however, changed this feature; presenting another opportunity for Vermonters to show their mettle. With the northern frontier again threatened by the British, the courage, patriotism, and military acumen of the fathers,—many of whom were alive,—induced a prompt response to the call of the National government for help. As in the Revolution, so in the Second War with Great Britain, the Vermont troops were in evidence; and, at the Battle of Plattsburgh, 11 Sept. 1814, where Macdonough commanding 14 vessels of 2,244 tons, 882 men, 86 guns, defeated the British Capt. Downie, whose fleet consisted of 16 vessels, 2,404 tons, 987 men, 92 guns, it was the Vermont volunteers who silenced the shore batteries at the crucial time,—which New York troops were unable to do,—and made the victory possible, again stripping the waters of Lake Champlain bare of English vessels of war. This was the last important engagement in the Northern Department, and the result was joyously celebrated throughout the United States. Four months later peace was concluded. Official rolls, although imperfect, credit Vermont with: "Soldiers who served 1812-14, 4,170; Plattsburgh (Vt.) volunteers, 4,620." Vermont furnished one company of 84 men for the Mexican War, 1845-8. At the storming of Chapultepec, 12-14 Sept. 1847, two of these soldiers were the first to reach and lower the Mexican flag on the Bishop's palace. The Civil War, 1861-5, found Vermont with a nominal brigade composed of four militia regi-

VERMONT

ments, of less men than the law required, armed with obsolete equipment; not enough superannuated stuff to fit out *one* regiment. At the first call by President Lincoln for 75,000 volunteers, the legislature was called in emergent session, the National proclamation and State warning bearing even date, 15 April 1861. On 25 April the General Assembly convened, and, in one day, appropriated \$1,000,000 for war expenses; during the session of 42 hours, voted also \$7 per month to pay Vermont soldiers in addition to the \$13 per month allowed by the general government; laid a war tax of ten cents on the "grand list dollar"; provided for the equipment of six more regiments for a term of two years, afterward extending the period of enlistment to three years; and adjourned, after providing that the existing *first* regiment be recruited to its full quota. This regiment was mustered 8 May 1861, and two days later went to the front. Before the 11th of May volunteers for five regiments had offered their services, where only two were needed, thus emulating the patriotic ardor of Revolutionary days. The precedent for the \$7 per month in 1861 was established by the governor and council 21 June 1794, when an extra allowance was voted to the "minute men,"—Vermont's quota of 2,139,—under a call of the United States 19 May, ultimo. In 1861 the number of Vermonters subject to military duty was 60,719. At the close of hostilities Vermont was credited by the war department with 35,242 men, an excess of its quota of 1,513. One in ten of the total population, and more than one half of those subject to military service had fought for the Union. The State sent out 17 regiments of infantry; three batteries, one regiment of cavalry, and three companies of sharpshooters. The First regiment were three months' men; from the Second to the Eleventh (the last heavy artillery), inclusive, three years' enlistments; the other six were nine months' troops. The First Vermont Brigade consisted of the 2d, 3d, 4th, 5th, and 6th regiments; the Second Brigade, of the 12th, 13th, 14th, 15th, and 16th regiments. Vermonters enrolled in the regular army and navy are believed to have been in excess of 2,000; in the marine corps, 619; enlisted in Vermont organizations, 28,967; re-enlistments, 1,961; commissioned officers in the navy, 84; in the marine corps, 3. Vermont appropriated for war purposes, \$9,887,353, on a total valuation of \$85,000,000, of which \$5,215,787 was paid by towns. In the Spanish-American War (1898) Vermont promptly responded, but its troops were not called into action. Admirals George Dewey and Chas. E. Clark were the notable Vermont figures of that contest.

Population.—The percentage of increase in Vermont's population has been quite insignificant since 1850. The surplus of "brain and brawn" has been contributed, with the Civil War exception, to develop the West, and the cities of contiguous States. The younger generations have, since 1837, gone out to improve the country at large; so much so that, in 1890, there were more than 1,000 farms virtually abandoned; others were indifferently cultivated, and, others still, grown up again to primeval forest. Associations of "Native Vermonters" exist in all the larger cities of the East and West; and the annual meetings are notable both for their distinguished personnel, and the loyalty expressed

for the childhood's home amid the Green Mountains. A small percentage return to occupy the paternal acres; quite large estates are held as summer residences, and another transition stage is now in progress which bids fair to upbuild the commonwealth, and still further augment the financial statements of its later history.

The population 18 June 1761, was 22,—the families of six actual settlers and landowners in Bennington. The temporary population of Fort Dummer (late in Massachusetts) had not been preserved. These pioneers had been increased, in 1791, to 43,970 on the east side, and 41,569 on the west side. In 1800 the population was, 154,465; (1810) 217,895; (1820) 235,981; (1830) 280,652; (1840) 291,948; (1850) 314,120; (1860) 315,008; (1870) 330,551; (1880) 332,286; (1890) 332,422; (1900) 343,641.

HENRY LEONARD STILLSON,
Vermont Journalist and Historian.

Vermont, University of, and State Agricultural College, located at Burlington, Vt. The University of Vermont was chartered in 1791, and first opened to students in 1800, the first class being graduated in 1804. The State made a grant of land of 29,000 acres for the use of the university, and the governor of the State and speaker of the house were made members *ex officio* of the board of trustees. In 1862 the Vermont Agricultural College was chartered, but as it did not receive the support necessary to put it into operation, it was incorporated in 1865 with the university under the title of the University of Vermont and State Agricultural College. Under this new charter the board of trustees consists of the governor, the president of the university, members *ex officio*, nine members elected by the State legislature, three every two years, for a term of six years, and nine other members having the power to fill vacancies in their number. The university also receives an annual State appropriation of \$6,000. The medical department, which prior to 1899 was a partially independent affiliated school, is one of the oldest medical schools in the United States, having been opened to students as early as 1809. It was suspended from 1836 to 1854, but after the latter date its growth was continuous, and in 1899 it became an integral part of the university under the entire control of the board of trustees. The university has maintained a steady growth from the first, except during the War of 1812, and the Civil War. In 1814-15 the college buildings were used as barracks, and all exercises were suspended; in the Civil War large numbers of students left the university to join the army. The organization of the university now includes: (1) the department of arts; (2) the department of science, which is the agricultural college; (3) the department of medicine. Women are admitted to the departments of arts and sciences. The department of arts offers a classical course leading to the degree of A.B., a literary-scientific course leading to the degree of Ph.B., and a course in com-

VERNAL GRASS—VERNIER'S LAW

merce and economics, leading to the degree of B.S. in commerce and economics. The A.B. and Ph.B. courses are largely elective after the freshman year. The department of science offers courses in civil and sanitary, electrical, and mechanical engineering, a chemical course, and an agricultural course, all leading to the degree of B.S. Shorter courses of one or two years are also provided in agriculture. The department of medicine offers a four years' course leading to the degree of M.D. The university also confers the degrees of A.M., M.S., C.E., M.E., and E.E. for graduate work. There are 56 endowed scholarships, 30 State scholarships, and a students' loan fund. The university buildings on the campus include Old College, a reconstruction of a building erected in 1825, the corner-stone of whose southern part was laid by General Lafayette; Converse Hall, a dormitory; Grassmount, woman's dormitory; the Billings Library; the Williams Science Hall; the mechanical buildings; the agricultural buildings; and the gymnasium; the medical department occupies buildings in the city. The library in 1904 contained 67,812 volumes. In 1904, in which year the centennial of the first graduation was celebrated, a movement was begun by the alumni to raise a centennial endowment fund of \$1,000,000. The students in 1904 numbered 566, of whom 341 were in the departments of arts and sciences. Among the graduates have been one vice-president of the United States, one cabinet minister, three United States ministers to foreign nations, four governors of Vermont, and 14 college presidents.

Vernal Grass, Sweet. See SWEET GRASS.

Verne, Jules, zhül vèrn, French novelist: b. Nantes, France, 8 Feb. 1828. He studied law, but early turned his attention to literary work, at first writing short pieces for the stage, and in 1863 published 'Five Weeks in a Balloon.' He inaugurated a new school in fiction, basing his stories on the inventions of the day and coupling them with clever exaggeration and wild adventure. The interest in his work depends entirely on incident, his characters being without life, designed merely as puppets to sustain the narrative. His numerous books are widely popular and have been translated into various languages. Among them are: 'Le Désert de Glace' (1867); 'Le Tour du Monde en 80 Jours' (1873); 'La Maison à Vapeur' (1880); 'L'Etoile du Sud' (1884); 'L'Ile à Hélice' (1895); 'Le Sphinx des Glaces' (1897); 'Le Village Aérien.'

Vernet, vèr-nā, Antoine Charles Horace, known as "CARLE VERNET," French painter: b. Bordeaux 14 Aug. 1758; d. Paris 17 Nov. 1836. He was the son of Joseph Vernet and distinguished as a painter of the Napoleonic battles, who ever aimed at the glorification of the victor of Friedland and Fontenay. He also painted portraits and hunting scenes. His comic pictures are interesting and valuable as records of contemporaneous manners.

Vernet, Claude Joseph, French painter: b. Avignon 14 Aug. 1714; d. Paris 3 Dec. 1789. Going to Rome in 1734, he received his art-training from A. Manglard and returned to France (1753) to become member of the Académie and to paint for Louis XV. a series of views of French seaports (now in the Louvre).

His landscapes and marines are well set-off with figures, he evidently imitated the manner of Claude Lorraine, but his pictures are finished with a certain conventional monotone which detracts from their reality. Consult Lagrange, 'Joseph Vernet et la peinture au XVIIIème siècle' (1861).

Vernet, Jean Emile Horace, commonly called "HORACE VERNET," French painter: b. Paris 30 June 1789; d. there 17 Jan. 1863. He was the grandson of Claude Joseph Vernet (q.v.), and son of Antoine Charles Horace Vernet, better known as Carle Vernet (q.v.). His first master in art was his father and even at 13 he could support himself by the payments received for his drawings. He studied also under the designer Moreau, the architect Chalgrin, and the painter Vincent. His 'Capture of a Redoubt' (1799) took the public by storm; it was a new departure from the frigid classicism of David and was alive with modern feeling and realistic life. On the hopes kindled by this success he married, opened a studio, and established a manner of his own. He became the first representative in art of the Napoleonic war spirit with all its swagger and chauvinism, and offended the government of the Restoration by his anti-monarchical caricatures, so that in 1822 his works were excluded from the exhibition; this induced him to open a picture-gallery of his own, which was very successful. His increasing popularity at last induced Charles X. to appoint him to the directorship of the French Academy in Rome, a post which he ably filled till the end of 1834. On his return to Paris Louis Philippe commissioned him to paint the historical galleries of the museum of Versailles, a task which occupied him five years. Among the most remarkable of the pictures are 'The Occupation of Ancona'; 'The Assault of the Town of Constantine in Africa'; 'The Attack of the Citadel of Antwerp'; 'The Fleet Forcing the Tagus'; 'The Dog of the Regiment'; 'The Soldier of Waterloo'; 'The Battles of Jemappes'; 'Montmirail'; 'Fontenoy'; 'Wagram'; 'The Capture of La Smala'; 'The Prayer in the Desert'; 'The Council of Arabs.' His last great picture was 'The Battle of the Alma.' Consult: Durand, 'Joseph Carle et Horace Vernet' (1865); Rees, 'Vernet et Delaroche' (1880).

Vernier, vèr-nī-èr, in mechanics, an index fitted to slide along the edge of a scale (as that of a barometer) and having divisions marked upon it, by means of which readings may be taken to small fractions of the parts actually marked on the scale. Suppose we have a scale of inches and tenths of an inch, and suppose the index is nine tenths of an inch, and divided into 10 divisions. Suppose that in taking a reading the end of the index is past the 8 figure on the scale we write down 8, that it is past 3 of the 10th spaces and part of another we add .3, then looking up the index we find that its 6th division most nearly coincides with a division on the scale and we add .06, and so the position of the index is taken as marking 8.36 inches.

Vernier's Law, the name applied to a scale by which linear or angular magnitude can be read off with a much greater degree of accuracy than is possible by a mere mechanical division and subdivision. It derives its name from its

VERNON — VERONA

inventor, Pierre Vernier (q.v.), who gave a description of it in a published work in 1631.

Vernon, ver'nôn, **Edward**, English naval officer: b. Westminster, England, 12 Nov. 1684; d. Nacton, Suffolk, 30 Oct. 1757. He was educated at Westminster and Oxford and in 1700 entered the royal navy. In 1702 he was promoted lieutenant, and in 1704 was engaged under Sir George Rooke at Malaga, continuing in the navy until 1721, when he retired on half-pay. In 1722 he was returned to Parliament for Penryn, but in 1726 he assumed command of the *Grafton* in the Baltic fleet, and later joined the forces at Gibraltar. He returned to England on the conclusion of peace with Spain in 1728, and resumed his seat in Parliament. He vehemently insisted in the House on the weakness of the Spanish colonies, and upon declaring that he could take Porto Bello, on the Isthmus of Panama, with six ships, he was in 1739 appointed vice-admiral and given command of the West Indian expedition. He succeeded in capturing Porto Bello in November of that year, but his attack upon Cartagena in 1741 was unsuccessful. In 1742 he returned to England, and having in his absence been elected to Parliament for both Penryn and Ipswich, he chose to sit for the latter. He was promoted admiral in 1745, but in 1746 was removed from his office by reason of a quarrel with the admiralty. He continued to sit in Parliament until his death. His second attack off Cartagena is introduced in Smollet's novel 'Roderick Random,' the author, together with Laurence Washington (brother of George) having participated in the expedition. The latter named his estate in honor of the admiral "Mount Vernon." Vernon wrote: 'A New History of Jamaica' (1740); 'Original Papers Relating to the Expedition of Panama' (1744); etc.

Vernon, George John Warren, 5TH BARON, English scholar and philanthropist: b. Stapleford, Nottinghamshire, 22 June 1803; d. near Derby, England, 31 May 1866. He was one of the wealthiest men in England, and devoted his life to the service of letters, philanthropy, and reform. He entered public life in 1831 as member of Parliament for Derby and was an active supporter of the Reform Bill. In 1835 he succeeded to the title of his father and his seat in the House of Lords, honors which hampered in some degree his political career, though he remained liberal in sentiment and a progressive and public spirited citizen to the last. His labors as a philanthropist during the cotton famine in Lancashire in 1862-3 made him much beloved, his generosity and personal exertions doing much to alleviate the widespread distress of that period. He was a profound student of Dante, and published editions of Dante annotated by himself.

Vernon-Harcourt, Leveson Francis, English civil engineer: b. London 25 Jan. 1839. He was educated at Oxford, and studied under Sir John Hawkshaw in 1862-5, later becoming his assistant. He engaged in engineering on various water works and railways, went to London in 1875, where he established himself as a hydraulic engineer, and is generally recognized as an expert in his profession. He visited India in 1896 to make an inspection of the River Húgli, was British member of the jury for civil engineering at the Paris exposition in

1900, and since 1882 has occupied the chair of civil engineering at University College, London. He has published: 'Rivers and Canals' (1882); 'Achievements in Engineering' (1891); 'Civil Engineering as Applied in Construction' (1902); etc.

Vernon, Conn., town in Tolland County; on the New York, New Haven & Hartford Railroad; about 12 miles east by north of Hartford. There are three villages and one city included in the town. It is in an agricultural region, and has considerable manufacturing interests. In 1900 (government census) there were 123 manufacturing establishments with a capital of \$5,743,445. In the manufactories were 2,449 employees to whom were paid annually \$928,886. The value of the yearly output was \$5,499,418. The chief manufactures are silk, cotton, and woolen goods. The dairy and farm products shipped from the town are quite extensive. Pop. (1890) 8,808; (1900) 8,483.

Vernon, Texas, town, county-seat of Wilbarger County; on the Pease River, and on the Fort Worth & Denver City Railroad; about 165 miles northwest of Fort Worth. The town was founded in 1881. It is in an agricultural and stock-raising region. The chief manufactures are flour, ice, and cotton, and cottonseed products. There are extensive shipments of wheat, cotton products, and live-stock. There are two national banks, which, in 1903, had a combined capital of \$100,000, and deposits amounting to \$520,200. Pop. (1890) 2,857; (1900) 1,993.

Verona, vâ-rō'nâ, Northern Italy, (1) A city, capital of the province of the same name, 72 miles west of Venice by rail, beautifully situated where the last slopes of the Alps merge into the plains of Lombardy, on both sides of the Adige, which traverses the city in a wild and rapid torrent, and is crossed here by six bridges. The town is surrounded by lofty walls flanked with towers and bastions, and is entered by five gates remarkable alike for solidity and beauty. Many of the streets, though narrow and crooked, are lined by splendid mansions, particularly rich in marble decorations, and there are several elegant squares. New embankments and buildings along the Adige, numerous industrial establishments, electric lighting, and street railroads are modern features. Among the more interesting buildings is the Roman amphitheatre, occupying one side of the Piazza-Brà; it is supposed to have been built in the 2d or 3d century A.D. The interior is nearly perfect; it is in the form of an ellipse, the transverse axis of which is 510 feet, and the conjugate 410 feet; it is 106 feet high, and on the 45 tiers of steps 27,000 spectators could be accommodated. There are about 50 churches, many of them magnificent specimens of Gothic architecture, rich in paintings and other art treasures. The cathedral is an imposing Gothic structure of the 14th century, with a choir and Romanesque façade of the 12th; the church of Saint Zeno is a Romanesque basilica of noble proportions, with some interesting old statues and reliefs; those of Saint Anastasia, Saint Giorgio, and Saint Fermo Maggiore, should also be mentioned. The Palazzo del Consiglio, in the Piazza dei Signori, dates from the beginning of the 16th century; it is adorned with statues of celebrated natives of the town, among whom

VERONA — VERONICA

are Cornelius Nepos, Catullus, Pliny the Younger, and Vitruvius. Close by are the imposing Gothic tombs of the Della Scala family (known also as the Scaligeri), who for upward of a century (1262-1389) were the lords of Verona. There are several theatres, a museum with a valuable collection of antiquities, a public library, hospitals, and numerous literary and artistic institutions. The town carries on manufactures of silks, woollens, hats, etc., and has an important trade. Verona is supposed to have been founded in the 4th, and to have been subjected to the Romans in the 2d century B.C. On the decline of the Roman empire it was taken by the Goths, and made by Theodoric the capital of his empire. In 774 it was captured by Charlemagne, and took a lead among the Italian cities while the power of the emperors in Italy lasted. It afterward became an independent republic, but suffered much from the dissensions of its nobles, a state of affairs depicted by Shakespeare in 'Romeo and Juliet.' Weary of the vicissitudes to which it had been subjected, it voluntarily ceded itself to Venice, under which it remained from 1405 to 1797. It then passed into the hands of the French, afterward into those of the Austrians, under whom it possessed great strategic importance, as it formed a member of the celebrated "Quadrilateral," or four mutually supporting fortresses (Mantua, Verona, Peschiera, and Legnago) which secured the Austrian position in northern Italy, and formed the key to the Tyrol from the south. Here in 1822 the Congress of Verona, consisting of European monarchs and diplomats, under the leadership of Metternich, decided upon the suppression of the Spanish revolution by the intervention of the Holy Alliance (q.v.). With the rest of Venetia, Verona was incorporated with Italy in 1866. Pop. (1901) 74,261. (2) The province of Verona in the compartimento of Venice has an area of 1,185 square miles. Pop. (1901) 422,437.

Verona, vē-rō'na, Pa., borough, Allegheny County; on the Allegheny River and the Allegheny Valley Railroad; about 10 miles northeast of Pittsburg. It has a number of manufacturing establishments, chief of which are glass works, foundries, machine shops, and powder and dynamite works. It has a national bank which has a capital of \$50,000, deposits amounting to \$194,000, and loans and discounts, stocks, and securities to the amount of \$259,800. Pop. (1890) 1,477; (1900) 1,904.

Veronese, vā-rō-nā'zē, **Paul** (his real name was PAOLO CALIARI), Italian painter: b. Verona 1528; d. Venice 19 April 1588. He studied under his uncle Antonio Badile, a painter; and copied the style of Carazzola, and the Veronese school, as appears from the many altar-pieces and frescoes which he executed at Verona. He went in 1548 to Mantua where he executed frescoes for the cathedral and afterward to Venice. Here he imitated Titian and Tintoretto, but at the same time appeared desirous of surpassing them by a more studied elegance, and a richer variety of ornament. It soon became evident from his works that he had studied the ancient statues, and the etchings of Parmesan and Albert Dürer. His first works are frescoes on the ceiling of the sacristy in the Church of St. Sebastian in Venice, now known to the Italians as "Teatro di Gloria," that is,

the glory of Veronese. The 'History of Esther,' in fresco, which he afterward painted in this church, excited general admiration. Among other works by him at Venice are: 'The Coronation of the Virgin,' altar-piece; the 'Martyrdom of Saint Sebastian'; 'The Feast at Simon's House' (now in the Brera, Milan). It was during this time that he formed his style as a master of the Venetian school. He had already acquired the Veronese spirit of color, with its clear pale tone, and soft harmoniousness. He was now under the influence of Titian, but he never surrendered his own individuality so far as to become an imitator. After accompanying the Venetian ambassador Grimani to Rome, he saw with enthusiasm the beautiful models of Raphael and Michelangelo, and painted after his return his fine 'Apotheosis of Venice.' His numerous banqueting pieces are also excellent. Six at least of these are found at Venice in the refectories of the monasteries, among the best of which are the 'Marriage at Cana,' comprising 120 figures, many of which are portraits. In this piece the extravagant display of almost Asiatic pomp, and the confusion of different persons and dresses, have been justly censured. The air of pride in the aspect of Christ, instead of a simple expression of dignity, the placing of the principal personage in a corner of the picture, and the confused blending of the white tablecloth and the architecture of the background, have also been considered blemishes. In his 'Pilgrims of Emmaus' Paul violated all the unities of time, place, and action. But with all these faults he displays talent and fruitfulness of conception. In short, his works are rather to be considered as contributions to decorative effect than either religious paintings or representations of life in the past. They are neither historic nor devotional, but merely magnificent combinations of form and color intended to add life, warmth, and variety to vast architectural spaces, and to interest the spectator by their expressive faces, their gorgeous costumes and the movement and dramatic action of the scene. He died in 1588. His scholars were Charles and Gabriel, his sons, and Benedetto, his brother, besides Michael Parrasio, Naudi, Maffei, Verona, Francesco Montemezzano. Consult Weiggirer, 'Veronese' (1897).

Veronica, vē-rōn'ī-ka, **Saint**, a woman who, when Christ was carrying his cross, lent him her veil to wipe the sweat from his face, and on receiving it back found his likeness imprinted on the cloth. This veil is said to be still preserved at Rome, where it is shown to only a few persons of special rank. It is commonly supposed that the Saint Veronica of the legend received this name in mistake, and that it arose from a misunderstanding and corruption of the term *vera icon*, true image, originally applied to the likeness itself. Various ancient witnesses, however, have identified Veronica with different persons mentioned in the Gospels. In the legend of the Clementines Veronica is another form for Berenice, the daughter of the Canaanitish woman who won from Jesus the recovery of her child. According to the 'Acts of Pilatus,' and in the writings of Cassiodorus, Reginus, Cedrenus, etc., she was the woman healed by Christ of her issue, who afterward raised to Jesus a statue in bronze at Paneas. Consult Grimm, 'Die Sage von den Christusbildern' (1842).

VERPLANCK — VERSAILLES

Verplanck, vèr-plānk', Gulian Crommelin, American Shakespearian scholar and legislator: b. New York 6 Aug. 1786; d. there 18 March 1870. He was graduated from Columbia in 1801, admitted to the bar in 1807, and afterward traveled in Europe. In 1820 he was elected to the New York legislature; was professor of the evidences of revealed religion and moral science at the General Protestant Episcopal Seminary, New York, in 1821-5; served in Congress in 1825-33; and was a member of the New York senate in 1838-41. He was a governor of the New York City Hospital in 1823-65; president of the New York Board of Emigration Commissioners in 1846-61; and from 1865 until his death was vice-chancellor of the State University. He edited 'Shakespeare's Plays, with his Life' (3 vols., 1844-7) and wrote: 'The Bucktail Bards and the Epistles of Brevet Major Pindar Puff,' political satires directed at De Witt Clinton (1818); 'Evidences of Revealed Religion' (1824); 'Discourses and Addresses' (1833); nearly half of the 'Talisman,' an annual conducted jointly with Robert C. Sands and William C. Bryant (3 vols., 1827-30); etc. His most enduring work was that performed in connection with his Shakespearian studies.

Verrall, vèr'al, Arthur Woollgar, English classical scholar: b. Brighton, Sussex, 5 Feb. 1851. He was educated at Wellington College, Cambridge University, was called to the bar in 1877, and since 1874 has been a fellow of Trinity College, Cambridge. He has edited Euripides' 'Medea' (1881); edited and translated Æschylus, Seven (1887); Agamemnon (1889, 1903); and has written: 'Studies in Horace' (1883); 'Euripides, the Rationalist' (1895); etc.

Verres, vèr'èz, Caius, Roman governor of Sicily: d. 43 B.C. He was the son of a Roman senator and in his earlier career a supporter of the Marian faction which he afterward deserted to join the following of Sulla. He was recompensed for his conduct by a share in the confiscated estates of the defeated party, and was proquaestor to Dobella, prætor of Cilicia in 80-79. He became governor of Sicily in 73, but fairly impoverished the island by his mismanagement. The inhabitants gained the support of Cicero in 71 and Verres was brought to trial, with Cicero as prosecutor and Hortensius as defender. While the trial was still in progress Verres gathered a large share of his wealth together and fled to Massilia, where he lived in luxury for 27 years, when he was put to death by the proscription of Antony, whose greed he had excited.

Verrocchio, vèr-rōk'è-ō, Andrea del, Italian artist: b. Florence 1435; d. Venice 1488. He began as a goldsmith; was also a follower of Donatello in the practice of sculpture and eventually devoted himself to painting. He was as skilful in marble as in bronze work, and his sculptures at Florence are distinguished for lifelike expression and strong, truthful individuality. His best works are 'The Boy and the Dolphin,' a group on the fountain in the court of the Palazzo Vecchio; 'Madonna and Child,' a relief; 'David,' a bronze statue; 'Death of the Wife of Francesco Tornabuoni,' in the Bargello; and 'Doubting Thomas.' Going to Venice in 1480 he began the colossal

statue of Bartolommeo Colleoni, which was completed by Leopardi. In the Academy at Florence is his 'Baptism of Christ,' in which one of the angels is said to have been painted by Leonardo da Vinci. There are two other pictures, Madonnas, ascribed to him, one of which is in the Museum at Berlin.

Verrugas, vèr-roo'gās, Peru, a streamlet and ravine in the mountains of central Peru, spanned by a lofty viaduct of the Lima and Oroya Railway. The viaduct, with two piers, is 575 feet long and 252 feet high; it was completed in 1891 and replaced a similar construction with three piers opened in 1873 and destroyed by a flood in 1889.

Versailles, vèr-sälz' (Fr. vèr-sä-y), France, capital of the department of Seine-et-Oise, 11 miles southwest of Paris, is a town of royal construction, having risen up rapidly, regularly, and with great magnificence under the directions of the sovereigns of France, particularly Louis XIV., who made it the seat of his court, and lavished immense sums on its embellishment. It is justly regarded as one of the handsomest towns in Europe. The palace is the most conspicuous edifice, though somewhat monotonous in appearance. It was built by Louis XIV., but ceased to be a royal palace at the revolution of 1793, and Louis Philippe converted it into a national museum. It is filled with an immense collection of statues and paintings intended to represent all the principal personages and events connected with French history from Clovis downward. The principal façade bearing the inscription, *A toutes les gloires de la France* ("To all the glories of France"), and fronting the garden and park, is over 400 yards long. The park, both in extent and embellishment a fit accompaniment of the palace, attracts crowds of visitors, the *caux*, or fountains, when in play being specially attractive features. The palaces of the Grand and Petit Trianon are in the north of the park. The treaty of peace between Great Britain and the United States was signed at Versailles in 1783. Versailles was the German headquarters during the Franco-German war (q.v.) from September-March 1870-1, and the seat of the French government from the peace till 1879. Pop. (1901) 54,081.

Versailles, Ky., town, county-seat of Woodford County; on the Louisville & A. and the Southern R.R.'s; 14 miles southeast of Frankfort. It is in an agricultural region in which considerable attention is given to stock-raising. The industries are connected chiefly with the farm products. The educational institutions are Ashland Seminary (P. E.), Rose Hill Seminary (Christian), opened in 1875, and public elementary schools. The three banks have a combined capital of \$120,000 and deposits amounting to \$513,320. Pop. (1890) 2,575; (1900) 2,337.

Versailles, Mo., town, county-seat of Morgan County; on the Missouri Pacific Railroad; about 38 miles southwest of Jefferson City. It is in an agricultural region, and in the vicinity are valuable deposits of iron, kaolin, copper, and lead. There are near-by large fields of bituminous coal. The products of the mines contribute largely to the prosperity of the town. There are two banks with a combined capital of \$85,000 and deposits amounting to \$255,430.

VERSAILLES — VERSIFICATION

The high school was established in 1894. Pop. (1890) 1,211; (1900) 1,240.

Versailles, Ohio, village in Darke County; on the Cincinnati, H. & D. and the Cleveland, C., C. & St. L. R.R.'s; about 40 miles northwest of Dayton. It is in a farming section in which considerable attention is given to stock-raising. The chief manufacturing establishments are a flour mill, machine shop, and creameries. The educational institutions are Saint Dennis Academy (R. C.), a public high school, founded in 1884, public and parish schools, and a public library. There are two private banks which have a combined capital of \$49,000 and deposits amounting to \$260,000. Pop. (1890) 1,385; (1900) 1,478.

Verse, a line of poetry, consisting of a certain number of metrical feet, disposed according to the rules of the particular species of poetry which the author intends to compose. Also more commonly used as meaning a stanza, or combination of lines regularly recurring, whether like or unlike in measure. In the broader sense verse means poetry when expressed in measured cadence, and either oral or written. The origin of verse is unknown. Its cultivation indicates progress from the savage state, and it was probably an evolution from unconsciously poetic utterances of man at the dawn of human intelligence. It is doubtful if the verses of Hebrew poetry were measured, or had more of the mechanical form of poetry than an irregularly recurring cadence. The use of rhymed cadences is a comparatively modern invention. The multiplication of poetry and the growing fastidiousness of taste have constantly tended to increase the varieties of verse. Grammarians have elaborately classified these, and analytically distinguished the possible divisions of words into bars of accented and unaccented syllables. A mechanical adherence to a uniform measure is, however, irksome in poetry as well as in music; and poets who are gifted with any command of language vary their verse as their own feelings dictate. These arbitrary changes it is impossible to classify. Modern French and Italian verse is always rhymed. In America, England, and Germany there are the varieties of blank verse and rhyme. The former is commonly in 10 syllables or hexameters. See POETRY; RHYTHM.

Versecz, vër'shëts, Hungary, a town in the county of Temesvar, 42 miles by rail south of the town of Temesvar. It is the see of a Greek bishop, and has silk-mills, and a large trade in silk and wine. There are remains of an old castle. Pop. (1900) 25,199.

Versification, the art or practice of metrical composition as distinguished from prose composition. A verse is a line in poetry containing a definite number of measured syllables, and it is this quality of verse that distinguishes it from prose. The elements of a metrical line are syllables: two, three, or more syllables constitute a poetic *foot*, and a combination of two or more feet makes a verse, though often a verse consists of only one foot. Syllables are termed "long" or "short," and their length is their "quantity." In the prosody of the ancient classic languages, from which the terminology of our versification is derived, syllables are long or short according to the time required to utter them: but in English verse a "long" syllable

is simply an accented one, though its utterance may be more rapid than that of an unaccented syllable, and a "short" syllable is one that is without accent, or stress. Thus in the verse

Achilles' wrath, to Greece the direful spring
the metre is usually figured with the traditional signs of long (—) and short (v). The verse is iambic, made up of feet, each consisting of an unaccented and an accented syllable, and the orderly succession of these feet constitutes the rhythm of the line; without that orderly succession the line would be mere prose. In Latin prosody (as also in Greek) quantity, not accent, determines the prosodic quantity of a vowel or syllable. In the first verse of Vergil's 'Æneid' the words are accented as follows: *A'ma vir'umque cœno Troj'ae qui pri'mus ab o'ris*: so read, it is without poetic rhythm and cannot be referred to any poetical measure; but pronounced according to the prosodical quantities of its vowels or syllables it is a hexameter of the formula — v v | — v v | — | — | — v v | — |. But though accent not quantity determines the measure or prosodic value of a syllable in English verse, quantity nevertheless is an important element of perfect metrical composition in English. Verses in which the proportion of long (or rather full and rotund) syllables to short ones is large, produce a quite different melody from that of verses in which short or thin sounds predominate. Contrast

Five years have passed; five summers, with the length

Of five long winters! and again I hear
These waters, rolling from their mountain
springs;

with

Haste thee, nymph, and bring with thee
Jest and youthful jollity.

An unaccented syllable, as the last in *fortune*, may be long, while an accented one, as in *asset* may be short.

The unit of poetic measure is the foot, not the syllable; and the foot, in English versification, consists either of two or of three syllables. The dissyllabic feet are the trochee, a long and a short (— v) as in *festive*, and the iambus, a short and a long (v —) as in *remit*. There are two other dissyllabic measures employed in conjunction with the trochee and iambus, namely the spondee, two long (— —) and the pyrrhic, two short (v v) but of which no entire verse can be formed. In the line

Long at the window he stood, and wistfully
gazed on the landscape,

stood and *form* a spondee between trisyllabic measures. Of trisyllabic measures there are two kinds of which entire poems can be composed: they are the dactyl, a long and two short (— v v) as in *terrible*, and the anapest, two short syllables and a long (v v —) as in *intervene*. Another trisyllabic foot is the amphibrach, a long syllable preceded and followed by a short (v — v) as in *confusion*; but an amphibrachic verse, such as

Běcause hě | hās nēv'ěr | ā hānd thāt | is idlē |
may be regarded as anapestic with the first foot truncated:
Běcause | hě hās nēv'ěr | ā hānd | thāt is idlē;
and the verse which follows the above is strictly anapestic with one additional syllable:

VERSIFICATION

För the right | hölds the s̄wōrd | ānd the lēft |
hōlds the brīd|le.

Verses are named according to the number of feet or measures they contain, monometer (one meter), dimeter (two), trimeter, tetrameter, pentameter, hexameter, heptameter, octameter. Iambic measure is of most frequent use in English verse, whether as iambic monometer,

Take care
Beware;

or as iambic dimeter, trimeter, tetrameter, etc. Often an iambic measure has an added unaccented syllable, or hypermetric syllable, styled the feminine ending, as

Heārts beat|ing
At meet|ing;

Shē mōved | ūpōn | this ēārth | ā shāpe | ōf
bright|ness.

Iambic dimeter, too short a measure for entire poems, is freely introduced in odes and songs:

With ravish'd ears
The monarch hears,
Assumes the god,
Affects to nod

Iambic trimeter is the "short meter" of the hymnal, and is frequent in ballad poetry:

Have mercy, Lord, on me,
As thou wert ever kind.

Iambic tetrameter is the measure of 'Hudibras,' 'In Memoriam,' 'Marmion,' etc.:

Strong son of God, immortal Love,
Whom we, that have not seen thy face
By faith, and faith alone, embrace,
Believing what we cannot see.

The stanza of four iambic verses, the first and third verses tetrameters and the second and fourth trimeters, and with alternate rhymes, is the ballad-meter, and also the common meter of the hymnal:

What wight art thou, the ladye sayd,
That wilt not speake to mee;
Sir, I may chance to ease thy paine,
Though I bee foule to see.

The iambic pentameter is the "heroic measure" of English poetry:

Beloved vale, I said, when I shall con,
Those many records of my childish years.

A stanza of four iambic pentameters rhyming alternately is the elegiac stanza:

Beneath those rugged elms, that yew-tree's shade,
Where heaves the turf in many a mouldering
heap,

Each in his narrow cell for ever laid,
The rude forefathers of the hamlet sleep.

Unrhymed iambic pentameter verse is the blank verse by excellence, though other meters are also employed without rhyme, for example in Longfellow's 'Hiawatha,' which is in trochaic tetrameter.

The iambic hexameter is rarely used save as a means of relieving the monotony of verses in a different measure: it is the ninth or final verse in the Spenserian stanza: it is the Alexandrine verse

That, like a wounded snake, drags its slow
length along.

The iambic heptameter is the metre of Tennyson's 'May Queen':

The night-winds come and go, mother, upon the
meadow-grass,
And the happy stars above them seem to brighten
as they pass.

The iambic octameter is usually divided into two iambic tetrameters:

Where virtue wants and vice abounds, || there
wealth is but a baited hook.

Trochaic measures. The trochaic monometer and the trochaic dimeter occur only in combination with other meters:

Rich the treasure
Sweet the pleasure.
Crying,
Sighing,
Whining,
Pining.

Trochaic trimeter also is usually employed only in conjunction with other measures. But trochaic tetrameter is effectively employed by Longfellow as the sole measure of the poem 'Hiawatha':

From their aspect and their garments,
Strangers seemed they in the village;
Very pale and haggard were they,
As they sat there sad and silent.

More familiar is the trochaic tetrameter with alternately rhyming verses:

Life is real! life is earnest!
And the grave is not its goal;
Dust thou art, to dust returnest,
Was not spoken of the soul.

Trochaic pentameters:

Spake full well, in language quaint and olden,
One who dwelleth by the castled Rhine.

Trochaic hexameter:

Holy, Holy, Holy, all the saints adore thee.
Very rarely is the trochaic pentameter verse employed; of the trochaic octameter an example is had in Tennyson's 'Locksley Hall':

Many a night from yonder ivied casement, ere
I went to rest,
Did I look on great Orion, sloping slowly to
the west.

Like the other measures mentioned, the anapestic line may be either monometric or poly-metric; the lines

In the days of my youth, when the heart's in its
spring,

And it dreams that affection can never take wing,
are purely anapestic; but often in this measure the anapest gives place to an iambus or some other foot; for example

Whōse vīr | tūes like thīne | stīll īncrēase | with
its yēars.

The 'Song of the Shirt' and the 'Charge of the Light Brigade' are in the dactylic measure:

Make no deep scrutiny
Into her mutiny.
When can their glory fade?
O the wild charge they made!
All the world wondered.

Verses composed in one continuous measure become monotonous; to vary the melody dactyls or anapests are introduced among iambuses or trochees or *vice versa*, as in Longfellow's 'Rainy Day':

VERST — VERTEBRATA

My thoughts | still cling | tō thē mould | ěring
pāst,
But the hopes of youth fall thick in the blast
And thē dāys | āre dārk | ānd drēa|ry.

Byron in the 'Bride of Abydos' mingles in
one line dactyl and anapest, amphibrach and
iambus or trochee with the most pleasing effect:
Know yē thē | lānd whēre thē | cýprēss ānd |
mýrtlē
Are ěmblēms | ōf dēēds thāt | āre dōne ĩn | thēir
clime?
Whēre thē rāge | ōf thē vūl | tūre, thē lōve | ōf
thē tūr | tle,
Nōw mēlt ĩn | tō sōrrōw | nōw mād dēn | tō
crime.

The various combinations of poetic measures
are numberless, and some modern poets of emi-
nence appear to disregard all considerations of
regularity in their verse, so that only by close
study of the lines can the metre be discerned if
metre there be. Though the stanza which fol-
lows is rhymed, it appears to be as void of
rhythm as conversational speech, and far less
rhythmic than good English prose:

Here was a case for the priest: he heard,
Marked, inwardly digested, laid
Finger on nose, smiled, 'There's a bird
Chirps in my ear': then, 'Bring a spade,
Dig deeper!'—he gave the word.
—Browning, 'Gold Hair,' xix.

But though Browning and many of the poets
of the present day sometimes show a disregard
for rhythm and the conventional metres, in some
of their poems they aim at a harmonizing of
imagery and rhythm and even rhyme such as
never was thought of by earlier masters of the
art. Thus in the two very short pieces 'Meeting
at Night,' and 'Parting at Morning,' writes the
editor of a collection of some of Browning's
works, "the wave motion of the sea is indicated
in the form, not only by the arrangement of the
rhymes to form a climax by bringing a couplet
in the middle of a stanza like the crest of the
wave, but the thought also gathers to a climax
midway in the stanzas, and subsides toward their
close." The first piece consists of two stanzas,
each a picture in itself: it suffices to quote the
first stanza:

The gray sea and the long black land;
And the yellow half-moon large and low;
And the startled little waves that leap
In fiery ringlets from their sleep,
As I gain the cove with pushing prow,
And quench its speed i' the slushy sand.

The second stanza is:

Round the cape of a sudden came the sea,
And the sun looked over the mountain's rim;
And straight was a path of gold for him
And the need of a world of men for me.

Blank, or unrhymed, verse appears to have
been first composed in English by the Earl of
Surrey (d. 1547) in his translation of a portion
of Vergil's 'Æneid.' It was at once adopted as
the poetic form best suited for the drama, and
thereafter till Dryden's time no plays were writ-
ten in rhyme; but unrhymed verse did not come
into use in other kinds of poetry till the appear-
ance of Milton's 'Paradise Lost.'

JOSEPH FITZGERALD,
Author of 'Word and Phrase.'

Verst, vērst, ĩn Russia, a measure of
length, equal to 3,500 English feet, or very
nearly two thirds of a mile.

Ver'tebra, a segment of the backbone.
See ANATOMY; BONE; OSTEOLOGY.

Vertebra'ta, a group name, no longer sig-
nificant in classification, for all those animals
(the vertebrates) considered collectively which
possess a backbone, composed of vertebræ.
(See ANATOMY; OSTEOLOGY.) This category
would include mammals, birds, reptiles, am-
phibians, and fishes which have certain impor-
tant characteristics in common which distin-
guish them from mollusks, insects, crustaceans,
worms, and other animals of simpler type. Yet
it was not until 1797 that the distinctive char-
acteristics were stated with some precision by
Lamarck, who drew a firm line between "back-
boned," or vertebrate, and "backboneless," or
invertebrate, forms. Anatomists and embry-
ologists have since made the distinctions which
Lamarck pointed out yet more precise, and the
more important characteristics may be summed
up as follows: (1) In vertebrates the central
nervous system, namely, the brain and the spinal
cord, lies on the dorsal surface of the body,
and is tubular in structure. (2) In all young
vertebrates there is formed along the dorsal
surface of the gut, and therefore of hypoblastic
origin, a supporting rod or notochord, which in
the simpler forms may persist throughout life,
but in higher forms is more or less completely
replaced by the backbone—an axis developed
from the mesoblastic sheath of the notochord.
(3) In almost all young vertebrates several
pairs of slits or clefts open from the pharynx
to the exterior; in some amphibians, all fishes,
and simpler forms they persist throughout life
as respiratory organs, and are usually associated
with feathery gills; in most amphibians they
disappear during adolescence; in reptiles, birds,
and mammals they are practically functionless
vestigial organs, which in a few cases do not
even open. (4) A great part—for example,
the retina—of the vertebrate eye arises as an
outgrowth from the brain, whereas the eye of
invertebrates develops as a direct insinking
of the skin. (5) In vertebrates the heart is
formed on the ventral surface, while that of
invertebrates is dorsal. (6) Finally, vertebrates
agree with annelids and arthropods among the
invertebrates in being bilaterally symmetrical
segmented animals. The segmentation is shown
by the distribution of the nerves and ganglia,
by the gill-clefts, by the series of vertebræ, by
the muscle-segments and nephridia (kidney-
tubes) in embryonic life at least.

But, while our knowledge of these char-
acteristics has become more precise, it is no
longer possible to draw a boundary line between
vertebrates and invertebrates with a firm hand.
It can no longer be said that fishes form the
base of the vertebrate series, for hag and lam-
prey (*Cyclostomi*), though in many ways more
primitive, are certainly vertebrates; the lancelet
(*Amphioxus*), though perhaps degenerate, can-
not be excluded from the alliance; the *Tunicata*
(q.v.), though almost always degenerate in
adult life, are all vertebrates in their youth,
and the worm-like *Balanoglossus* (q.v.) has
also certain hardly disputable vertebrate char-
acters. Moreover, the influence of evolutionary
conceptions has led zoologists to disbelieve in

VERTICAL TRANSPORTATION — VESALIUS

the rigid apartness of any type—a disbelief which is, moreover, strengthened by the discovery of vertebrate affinities among various invertebrates—for example, annelids, nemerteans, and arthropods. See CHORDATA.

CLASSIFICATION OF VERTEBRATA OR CHORDATA.

MAMMALS

CYCLOSTOMATA	
Cephalochordata (Amphioxus) ..	} Surviving offshoots of ancestral vertebrates.
Urochordata (Tunicates)	
Hemichordata (Balanoglossus) ..	

Vertical Transportation. See ELEVATOR.

Vertigo, dizziness, giddiness, or swimming of the head; a defect, real or seeming, in the equilibration of the body. Though the condition is sometimes so distressing as to be considered by the patient a disease, it is essentially only a symptom. It is believed that the cerebellum is the centre for the co-ordination of muscular movements, and that impressions from the semicircular canals of the internal ear also influence the movements necessary for maintaining the equilibrium of the body. But the essential nature of vertigo is not yet clearly determined. By some it is believed to be due to disordered cerebral circulation; by others, to result from a disturbance of the central nerve-ganglia. The sense of instability and of apparent rotary movement of the body or of other objects, always present, may be attended by mental confusion or loss of consciousness, or by anguish or terror. There may or may not be present also buzzing in the ears, mist or flashes of light before the eyes, nausea and vomiting, looseness of the bowels, and a flow of pale urine. Vertigo may result from functional disorders of the heart or stomach, from defects in vision, from diseases of the middle ear, from some peripheral irritations (as laryngeal vertigo), from toxæmias, as in Bright's disease, from organic brain disease, and from unrecognized causes. Grasset classifies vertigo under two heads, acute or accidental, and chronic or habitual. Under the first head he places forms of it which attend the onset of acute infectious diseases, inflammations, influenzas, and the vertigo which accompanies the stage of excitation in cerebro-spinal meningitis, that which appears with attacks of indigestion, the vertigo of acute alcoholism and of the first cigar, and the dizziness caused by swinging, dancing, seasickness, or by looking down from a great height. Then there are acute toxic vertigos caused by digitalis, hemp, opium, belladonna, gelseminum, nicotine, etc., also others caused by heat, the introduction of a bougie, the suppression of habitual discharges, the pressure of wax or other accumulations on the drumhead, nasal obstruction and post-nasal catarrh, mental strain, emotional disturbances, etc. Under the head of chronic vertigos are placed epileptic vertigo, vertigo dependent upon disturbances in the sensory nerve-centres, especially auricular vertigo, stomachic and cardiovascular vertigo.

In the treatment of vertigo the main thing is to remove the cause. Vertigo caused by indigestion frequently demands a prompt emetic or purgative. The tone of the stomach may be restored by tincture of nuxvomica, or by dilute hydrochloric acid. Smokers' vertigo re-

quires for relief a complete cessation from smoking, a slight laxative, and bitters. For the vertigo of seasickness bromide of sodium, or amyl nitrite, and kola-seeds, diminishing as much as possible the drinking of liquids, and the use of a tightly drawn ventral bandage, seem to be of most service. Ocular vertigo, dependent upon astigmatism, hypermetropia, paralysis of certain of the ocular muscles, and various eye-strains, may often be relieved by the oculist.

Vertue, ver'tū, **George**, English engraver and antiquary: b. London 1684; d. there 24 July 1756. He gained the favor of Sir Godfrey Kneller, Lord Somers, and others, and upon the institution of the Academy of Painting in 1711 became one of the original members. When the Society of Antiquaries was revived in 1717 he was appointed its official engraver, nearly all the plates published in 'Vetusta Monumenta' down to 1756 being his work. He was engaged in making journeys through England for 40 years, collecting materials and making drawings for a projected history of the fine arts in England. His collection came into the hands of Horace Walpole, who published a portion of them under the title 'Anecdotes of Painting in England' (1762-71). To his own 'Catalogue of Engravers' (1763) he appended a biographical sketch of Vertue's life. Others of Vertue's best-known works are 12 'Portraits of Poets' (1730); 10 'Portraits of Charles I., and his Friends'; and the series of English kings published in Rapiin's 'History.'

Ver'ulam, LORD. See BACON, SIR FRANCIS.

Ver'vain. See VERBENA.

Verviers, vër-vē-ä, Belgium, a town in the province of Liège, on the Vesdre, 14 miles southeast of Liège, and on the railway between Liège and Aix la Chapelle. Formerly a fortified town, its fortifications were destroyed by Louis XIV. It is celebrated for its manufacture of broad-cloth, which is the staple of the town. There are also cotton, leather, and other manufactures. Pop. (1900) 49,067.

Very, Jones, American poet: b. Salem, Mass., 28 Aug. 1813; d. there 8 May 1880. He was graduated at Harvard in 1836, and was Greek tutor there 1836-8. He became a Unitarian minister in 1843, but never held a pastoral charge although he preached occasionally. In 1839 he published a small volume of 'Essays and Poems'; the latter, among which 'The Painted Columbine,' is perhaps the best known, indicating an appreciative love of nature, and a deep religious feeling with a tendency toward mysticism, and these qualities are especially marked in his sonnets, which follow the Shakespearean model. His life was mainly spent in retirement at Salem. Consult 'Poems and Essays' (1880), with memoir by J. F. Clarke.

Vesalius, vē-sā'li-ūs, **Andreas**, Flemish physician, founder of the modern system of anatomy: b. Brussels 31 Dec. 1514; d. island of Zante 15 Oct. 1564. He was educated at Louvain, Cologne, Montpellier, and Paris, and was early distinguished by his knowledge of physics and his devotion to anatomical studies. The pursuit of practical anatomy was attended with so much difficulty and danger in France, that after returning to Louvain he joined the army of the emperor of Germany, and went to Italy,

VESICANT — VESPERTILIONIDÆ

where in 1540 he was made professor of anatomy in the University of Pavia, in 1543 in that of Bologna, and not long afterward in that of Pisa. In 1543 he published his great work on anatomy, 'De Corporis Humani Fabrica' (enlarged ed. 1555). Sénac calls it the discovery of a new world, and Haller speaks of it as "an immortal work, by which all that had been written before was almost superseded." In it Vesalius exposed the errors of the Galenian school, who relied for their knowledge of the anatomy of the human body upon the observations made in the dissection of the bodies of the lower animals. The work met with the fiercest opposition, but the author's reputation constantly increased. About 1544 he was made chief physician to the emperor Charles V., and afterward to his son Philip II. He was accused of heresy and condemned to death by the Inquisition, but his sentence was commuted by the emperor to a pilgrimage to the Holy Sepulchre. On his return he was shipwrecked at Zante. His collected works were published in 1725. Consult the study by Roth (1886).

Ves'icant. See BLISTER.

Vespasian, vēs-pā'zhī-an (TITUS FLAVIUS SABINUS VESPASIANUS), emperor of Rome: b. Reate, in the country of the Sabines, 17 Nov. 9 A.D.; d. June 79. Being appointed commander of a legion in the reign of Claudius he acquired great reputation in Germany and in Britain, and on his return to Rome was made consul. Subsequently he was appointed proconsul of Africa; and on the rebellion of the Jews was sent with an army into Judea (66). After subduing almost the whole of Galilee he was about to attack Jerusalem, when he received the news of the death of Nero (68 A.D.) After the transient reigns of Galba, Otho, and Vitellius, he was elevated to the imperial power, and reaching Rome about the middle of the year 70, was received with great rejoicing. He reformed the army discipline, and appointed a commission to settle the vast multitude of suits which had accumulated during the late troubles, besides presiding on the bench frequently himself, that justice might be administered with impartiality. Vespasian favored arts, letters, and learned men, particularly Quintilian, Pliny, and Josephus. He rebuilt a part of the city, restored the capitol with increased splendor, and erected the gigantic amphitheatre, the ruins of which are known as the Coliseum. Among important public events of his reign are the termination of the dangerous rebellion of the Gauls under Civilis, and the capture of Jerusalem by his son Titus, whom the emperor had made his lieutenant in Judea.

Vesper Sparrow, Grass Finch, or Bay-winged Bunting, a well-known and abundant bird (*Poocates gramineus*), of the family *Fringillidæ*, found throughout the eastern United States and Canada, and represented in other parts of temperate North America by distinct sub-species. It is about six inches long and may be recognized by its streaked plumage, the bay or chestnut wing-patch and the white outer tail-feathers which are conspicuously shown during flight. The three common names of this bird show the interchangeability in ordinary usage of the appellations applied to the species of *Fringillidæ* and illustrate three peculiarities of

this bird: the first, its habit of singing at sundown; second, its abundance in grassy fields, and the third, the rather characteristic wing markings. No bird is more familiar to the stroller along country roads and byways in the New England and Middle States than the grass finch. It spends much of its time on the ground, but often perches on fences, telegraph wires and trees. Except during the breeding season it is gregarious and consorts with other ground-loving sparrows, like which it feeds upon seeds, grains and insects for which it often searches by the roadside. When approached, the grass finch runs rapidly and seldom flies more than a few yards before alighting. It is a bold and confiding bird. Its migrations are not extensive and it leaves late, returns early, and in open seasons a few may even remain throughout the winter in the Middle States. From the latitude of Virginia and Missouri northward is its breeding ground. The nest is placed on or near the ground and is a bulky structure of weed stems, leaves and grasses, with a lining of fine grasses or hairs. The eggs are usually 4 or 5, dull white, variously tinted and blotched at the larger end, especially with lilac and brown. Two or even three broods may be raised. As mentioned above the soft and sweet, but clear song is heard most frequently toward evening, but is by no means confined to that time. Consult Wilson, 'American Ornithology.'

Vespers (late Lat. *vespera*, vespers: plur. of *vespera*, evening), in the breviary (q.v.) of the Roman Catholic Church, the canonical hour following the nones and preceding compline, and thus the next to the last of the seven hours.

Vespertilionidæ, vēs-pēr-tīl-i-ōn'ī-dē, a family of bats including the great majority of small insectivorous species, and especially characteristic of temperate regions. In this family the muzzle has no nose-leaf, the premaxillary bones are defective and separated by a wide median vacuity, the number of incisor teeth is usually two on each side above and three below, and the tail is nearly or quite included in the inter-femoral extension of the wing-membrane. With the exception of a few found along our southern borders all of the bats of the United States belong to this family, nine genera and about 25 well-marked species being included. Among them may be mentioned the long-eared bat (*Corynorhinus macrotis*), typifying the subfamily Plecotinæ, in which the bases of the ears are joined across the top of the head, and which is found in the Southern States north to Virginia, the well known and variable little brown bat (*Myotis lucifugus*), so abundant everywhere in the east, and represented by closely related species westward, the pretty and equally abundant red bat (*Tasiurus borealis*), the larger and much rarer hoary bat (*T. cinereus*) which, like some other species, is a regular migrant, the larger brown bat (*Vespertilio buscus*), the twilight bat (*Nycticeius humeralis*) and the pipistrelle (*Pipistrellus subflavus*), all of which are more or less plentiful in the eastern States and whose habits are generally similar and familiar. A very distinct species of California and the Southwest is *Antrozous pallidus*, which has only two incisors on each side below and a slightly marked nasal fold. It belongs to the subfamily *Antrozoinæ*. Consult Miller, 'North American Fauna No. 13' (Washington 1897), and Allen,

'Monograph of North American Bats,' U. S. National Museum Bulletin, No. 43.

Vespucci, vës-poo'chë, **Amerigo** (Latinized **AMERICUS VESPUCCIUS**), Italian navigator: b. Florence 18 March 1452; d. Seville 22 Feb. 1512. He acquired in some fashion "an excellent practical knowledge of astronomy," and was the greatest expert of his day in the calculation of latitude and longitude. A clerk in the commercial office of the Medici at Florence, he made an avocation of the study of geography and the collection of globes, charts and maps. He became, too, a skilful map-draughtsman. Some time between the middle of 1489 and the end of 1491, he was sent to Barcelona as representative of the Medici in connection with Spanish business interests of importance; and in 1493 he became connected with the commercial house of Juanoto Berardi at Seville. Berardi was in the employ of the Spanish crown, and fitted out vessels for expeditions across the Atlantic. In 1495 he signed a contract for supplying 12 vessels of 900 tons burden in aggregate; and when he died in December, Vespucci settled the remainder of the contract and the various obligations in connection therewith. It is thus probable that Vespucci participated in the fitting out of Columbus' second voyage. Knowledge of Vespucci's career between early in 1496 and late in 1504 is based on two letters written by him, one (March or April 1503) to Lorenzo di Pier Francesco de' Medici, the other (4 Sept. 1504) to Piero Soderini, gonfaloniere of Florence. The latter gives an account of four voyages in which the writer took a part, the earlier two in the service of Spain, the later two in that of Portugal. The first expedition started from Cadiz port 10 May 1497 and returned 15 Oct. 1498, and Vespucci accompanied it as "astronomer." Very frequently, in the case of ill-equipped captains, the "astronomer" held a practically independent post and was really in control of all movements. Hence, to all intents and purposes the voyage was his. As an officer of such importance, then, Vespucci sailed. His account above mentioned is a cursory epistle, not an official report, and therefore, of course — but unfortunately — fails to supply many details that would now be of great value. He does, however, tell something of the flora and fauna of the regions visited, the natives and their customs. In the letter he several times refers to a work, 'Quattro Giornate' ('Four Journeys'), written, but not revised for the press, and including all suitable details. This manuscript has apparently perished. The letter to Soderini got into print in two editions, though it is highly improbable that Vespucci had any part in their appearance. The best-known one is that in Latin, printed at Saint-Dié, Lorraine, 1507; but there are extant 4 copies of an Italian version of 1506, from which, through a French text, the Latin translation was evidently derived. The letter says that the expedition after running to the Canaries, made land 1,000 leagues about west-southwest from those islands, coasted for 870 leagues along a shore so extensive that it was thought that of a continent, passed 37 days in a fine harbor and then returned to Spain. Vespucci, then, probably sailed from Cape Honduras to a point not far from Cape Cañaveral, Florida. Thus he visited what he thought was the continent of Asia, but was really that of

America, a year before Columbus. Owing either to a typographical error or the arbitrary alteration of an editor, a proper name Lariab, in the Italian version, has become *Parias* in the Latin. Lariab was apparently a name belonging to the country of the Huastecas around the river Panuco, while *Parias* was a name of a region 2,400 miles distant, on the South American east coast. It thus was long afterward assumed that Vespucci's first voyage was, as narrated by him, a bungling duplicate of his second, on which he clearly states he visited South America; and that he changed the date from 1499 to 1497 in order to obtain the honor of the discovery of the continent before Columbus. This confusion of Lariab and *Parias* occurred despite the fact that Vespucci scrupulously gives latitudes and longitudes. As a matter of fact, at the time of the writing of the letter (1504), Columbus was supposed to have discovered Asia by the new route in 1492, and Vespucci, had he wished to antedate Columbus, must have placed his first voyage before that date. In the letter to Lorenzo de' Medici, regarding his third voyage only (14 May 1501 — 7 Sept. 1502), Vespucci refers to the regions visited (The Brazil coast to lat 34° S., running thence southeast to South Georgia Island) as a "new world," because unknown to the ancients. One Giocondo, who prepared a Latin version, apparently from the Italian manuscript original, gave his rendering (1504) the title 'Mundus Novus.' This got put down as equivalent to what is now known as Brazil. Then the suggestion was given that *Mundus Novus* was the so-called Fourth Part of the earth, and ought to be called America, from its supposed discoverer, though as we now know Columbus had already reached it. Thus the name came to be equivalent to South America, and finally to the two continents. Consult the critical and biographical notes by Winsor in his 'History,' Vol. II. (1886); Fiske, 'The Discovery of America' (1802); Harris, 'Discovery of North America' (1892).

Vest, George Graham, American lawyer: b. Frankfort, Ky., 6 Dec. 1830. He was graduated from Centre College, Danville, Ky., in 1848, and from the law department of Transylvania University 1853. In the last named year he went to Missouri and began the practice of law. He was a member of the Confederate Congress for three terms and was United States senator, 1879, 1885, 1891, 1897 and 1903.

Ves'ta, the Roman goddess to the hearth similar to the Greek *Ἑστία* (Hestia), but independent in origin. The worship of Vesta arose from the necessity and difficulty in primitive times of obtaining fire. The custom came about of maintaining at some point a perpetual fire for general use, and this was continued after the necessity had ceased. The flame was personified, and associated with the Penates (q.v.) as a deity of the state. Vesta was not represented by any statue in the temple devoted to her honor, but by the symbolic fire kept perpetually burning on the hearth or altar by the vestals, her virgin priestesses. In Rome, on 1 March of every year, the sacred fire and the laurel tree shading her hearth were renewed; on 9 June, the festival called *Vestalia* was celebrated; and on 15 June

VESTA — VESUVIANITE

her temple was cleansed and purified. Prætors, consuls, and dictators, before entering upon their functions, sacrificed at Lanuvium, where the cult was believed to have been established first in Italy.

Vesta, in astronomy, the name of the fourth asteroid, discovered by Olbers at Bremen 29 March 1807.

Vestal Virgins, women dedicated to the service of the goddess Vesta, and bound by vows of chastity for the limited period of 30 years. The worship of this goddess, who appears to have been identical with the Greek divinity Hestia, is supposed to have originated in the guardianship of a central or village fire by the earliest communities of men. The difficulty of kindling fire before the invention of the lucifer match was well known to a generation which has but recently passed away, and in prehistoric times the care of a fire for the common use must have been a most important duty. It would naturally be intrusted to women, and preferably to those who were not distracted from it by family ties. The duty of maintaining this fire became a sacred function connected with the worship of a presiding goddess, after its original significance had been lost. Annually, on 1 March, the Latin New Year's Day, the fire was extinguished, and rekindled either by the friction of dry sticks, or, in later times, by the sun's rays being brought to a focus by a concave mirror.

The vestal virgins who had charge of the sacred fire, were chosen by the king in the early days of Rome, and by the pontifex maximus under the republic and the empire. The candidate was to be over six and under ten years of age, free from defects, with father and mother living, and daughter of a freeborn resident of Italy. Her hair was cut off, and she was formally initiated by the pontifex maximus, who thenceforth held toward her the relation of a religious father. The vestals had many privileges, and the honor was eagerly sought. After 30 years they could return to private life, and marry, if they chose. Violation of the vow of chastity during their years of service as vestals was punished by burial alive, and as the conviction was usually obtained on the evidence of slaves under torture, it is considered probable that some suffered who were innocent. The worship of Vesta disappeared with other pagan practices when Christianity became the religion of the empire.

Vested Rights, in law, a technical phrase, denoting a present fixed interest resting in a particular person or particular persons. They are opposed to contingent rights, which depend on some event or condition which may not come about before some other event or condition prevent their vesting. See PROPERTY.

Vest'ments, Ecclesiastical, the garments worn at religious services by priests and prelates of the Protestant Episcopal, Roman Catholic, and other churches. Nearly all denominations, even those that repudiate vestments, expect their ministers to wear attire indicative of their vocation, and this custom is not confined to Christian ministers, but prevailed in the Jewish hierarchy, and is still maintained in the religious system of modern Jews. In the Buddhist and Hindu religions, and in pagan creeds

of all kinds so far as known, the priests wear some garment or symbol to distinguish their order. For vestments worn in Roman Catholic and Protestant Episcopal churches, see CHASUBLE; STOLE; etc.

Ves'tris, Lucia Elizabeth Bartalozzi, English actress, granddaughter of Francesco Bartolozzi (q.v.): b. London, January 1797; d. Middlesex 8 Aug. 1856. She was carefully educated, and at 16 was married to Armand Vestris, a member of the famous family of dancers. In 1815 she separated from him and made her début on the Parisian stage with moderate success. Her appearance in London in 1820, however, was a marked triumph; she became famous in 'The Haunted Tower' playing at Drury Lane, and subsequently added to her reputation in the part of "Phœbe" in 'Paul Pry.' While lessee of the Olympic in 1838 she was married to Charles James Mathews. She was afterward manager of the Lyceum and of Covent Garden.

Vestry, a room adjoining a church where the vestments of the clergy are kept. Hence the place of meeting of those who had the charge of parochial affairs, and subsequently the persons themselves to whom these affairs were intrusted. This is the present meaning in American churches. Vestries, under church establishment in England, were originally intrusted with the secular affairs of the church, as the maintenance and repair of the building, and the levying of church rates for this and other purposes. They latterly acquired a general control of the affairs of the parish, but by the local government act of 1804 the vestries in rural parishes were superseded as regards their civil powers by the parish council or parish meeting. The vestries which formerly managed the affairs of the populous parishes of London were done away with by the London Government Act of 1809, under which a number of metropolitan boroughs, each with its own mayor, aldermen, and council, were established in their place and in the place of other anomalous authorities. In the United States, where no connection between church and state is recognized by law, the vestry is wholly confined to its duties as a body chosen from the congregation to attend to the interests of the church.

Vesunna, the ancient name of Périgueux (q.v.).

Vesu'vianite, or **Idocrase**, one of the commonest minerals which occur in tetragonal crystals. It is essentially a basic calcium and aluminum silicate, but all analyses show some iron and magnesium and occasionally titanium and manganese. The crystals are generally prismatic, terminated by the base often combined with the unit pyramid. Highly modified crystals are not infrequent. It also occurs massive and columnar. It has a hardness of 6.5 and a specific gravity of about 3.4. Its lustre is vitreous to resinous and sometimes splendid, while its colors are usually brown to yellow and green. A blue variety from Norway called "cyprine," owes its color to a trace of copper. Vesuvianite was so named in 1795 by Werner, who described the brilliant, brown crystals which are found in the ejected blocks of Vesuvius. The mineral has since been discovered in scores of localities, among the most noteworthy of which are the Vilui River in Siberia, Achmatovsk in the Urals,

VESUVIUS — VETCH

Ala in the Piedmont, Monzoni in the Tyrol, Wakefield in Quebec, near Helena, Montana, and Magnet Cove, Arkansas. It usually occurs in metamorphic limestone and the crystalline schists, or as a contact mineral.

Vesuvius, vē-sū'vī-ūs, Italy, a volcanic mountain, 10 miles southeast of Naples. With a basal circumference of about 30 miles, it rises from the centre of a plain 2,300 feet above the sea in a pyramidal truncated cone 1,500 feet high and about 2,000 feet in diameter; total height 3,800 feet. In 1880 a funicular railway was laid to the summit, which was reconstructed and equipped for electrical working 1903-4, and supplemented by a new electric railway four and three quarter miles long, from Pugliano, the northern quarter of Resina, thus enabling visitors to travel by electricity from Naples to within 250 yards of the crater. Previous to an eruption about 1838, the top was an uneven plane, but was then converted into a hollow cup, with a rim 400 feet to 500 feet broad on its west side, and not more than 50 feet on the others, and with an internal sloping surface to a depth of 500 feet. A precipitous rocky ridge, forming an arc of a circle, and 1,400 feet in height, called the Monte Somma, is situated at a short distance from the cone on the north, from which it is separated by a deep valley called the Atrio del Cavallo. Near the western extremity of this valley is the observatory established expressly for watching the volcanic phenomena. The lower part of the sloping plain, which rises gradually from the sea to the foot of the cone, forms a belt about two miles broad along the shore, laid out in vineyards and well cultivated, though intersected at intervals by terraces of black calcined matter. Beyond the cultivated belt the plain is rugged and covered with scoræ of all forms and sizes. The cone itself is covered with loose matter composed of scoræ, blocks of lava, and volcanic sand, arranged in successive layers by the natural force of gravitation. The form of the pyramid has been modified by side eruptions and by the internal force acting upon the external matter before it has cooled. An internal movement of elevation has been proved by the angle at which continuous streams of lava are now found being much greater than that at which they are known to have originally flowed. A stream of lava ceases to be continuous, and breaks into masses of scoræ at an angle of more than 3°. Monte Somma is supposed to have formed at one time a complete cone of much larger dimensions, and probably of greater height than the present cone, being subsequently thrown down by volcanic forces, in the same manner as 800 feet of the present cone was carried away by an eruption of 1822. From a difference of structure implying greater pressure, geologists have concluded that Somma was a submarine volcano, while the present is a subaerial one. Till 63 A.D., when many of the surrounding cities were damaged by an earthquake, no symptoms of activity are known to have been given forth by Vesuvius. In 79 occurred the great eruption described in the well-known letters by the younger Pliny, which buried Herculaneum and Pompeii, and during which the elder Pliny perished while hastening with part of the Roman fleet to the relief of the inhabitants. Since that time there have been continuous symptoms of activity, and numerous eruptions have taken place. The first

recorded discharge of liquid lava after that of 79 was in 1036. Since then there have been many violent eruptions; the most noted were those of 1779, 1793, 1834, 1847, 1850, 1855, 1867, 1872, 1878, 1880 and 1895. The eruption of 1779 was particularly magnificent, flames of fire rising to three times the height of the mountain, and stones, scoræ, etc., being projected as high as 2,000 feet, while a river of lava 1,500 feet wide flowed for three and a half miles and extended 600 feet into the sea. In 1872 14 different orifices opened in the mountain sending forth rivers of lava that threatened to carry devastation far and wide. The villages of San Sebastiano and Massa di Somma were almost entirely destroyed. A number of persons who had gathered near the observatory lost their lives by the sudden opening of two cracks which gave vent to stifling fumes and lava. See HERCULANEUM; POMPEII; VOLCANO.

Vetancurt, vā-tān-koort', or **Vetancour**, **Augustin**, Mexican historian: b. Mexico City 1620; d. Mexico 1700. He was a member of the Franciscan order at Puebla, in which he was held in high regard as a teacher and as a linguist. He was commissary of the Indies, a member of the provincial chapter, and was actively engaged in missionary work. His writings include various biographies and theological essays, in addition to his great works: 'Arte de Lengua Mexicana' (1673); and 'Teatro Mexicano' (2 vols. 1697-8).

Vetch, a name applied to many species of leguminous herbs, in the genera *Vicia*, *Astragalus*, *Phaca*, etc. They resemble pea-vines, and have pinnate, stipulate leaves and often climb over other plants by means of tendrils. The flowers are papilionaceous, of various colors, and the fruits are legumes or pods, containing the seeds. The broad or Windsor bean of Europe is one of the vetch tribe (*Vicia faba*). The vetches are numerous, and many of them, especially the common tares (*Vicia sativa* and *V. hirsuta*), are plants valuable either for grazing livestock, to cut for green fodder, or for ensilage with corn. They are rich in nitrogen, and are important not only for green manuring, or plowing under the soil, so that by decay this nitrogen may be released, but because the roots are covered with tubercles that are the home of bacteria which have the power of assimilating free nitrogen from the soil, and converting it into such a form that it may be used by the host-plant. If the roots are left to rot in the soil, the ground is enriched by this store of nitrogen, rendered available for other crops. Vetches, therefore, like other *Leguminosæ*, are valuable for poor lands, where they grow readily, and for restoring nitrogen exhausted by grass-feeding plants.

The American vetch (*Vicia americana*), with bluish flowers, grows in the moist soil of prairies and woodlands, and is a valuable forage-plant for the West. *Vicia caroliniana* was highly regarded as a medicine by the Cherokee Indians, who used it for dyspepsia, cramp, and rheumatic pains. Members of *Astragalus*, *Phaca*, and allied genera, the American species of which are chiefly western or sub-arctic, are called milk vetches, from the notion that feeding upon them would increase the milk of goats.

Other leguminous plants known as vetches are the chickling vetch (*Lathyrus sativus*)

VETERANS OF INDIAN WARS—VETERINARY MEDICINE

grown in southern Europe for a forage-plant and for its edible seeds, which are said, however, to produce paralysis of the lower limbs in men and animals. Some of the bitter vetches are included in the same genus, but one is *Ervum ervilia*. The vetchlings are also included in *Lathyrus* (q.v.). The bastard hatchet-vetch is *Biscerrula pelocinus*, with linear pods flattened transversely to the valve-edges, thus producing two sinuate false keels. The sensitive joint-vetch, *Æschynomene virginica*, has sensitive leaves, yellow flowers in axillary clusters, and jointed pods. The kidney-vetch (*Anthyllis vulneraria*) has heads of flowers with permanent inflated calyces, in pairs at the ends of the branches; it was formerly supposed to have medicinal properties. The horseshoe vetch (*Hippocrepis comosa*) has horseshoe-shaped pods, and is also called "unshoe the horse," from the magic property ascribed to it of taking the shoes off any nag that stepped upon it.

Veterans of Indian Wars of the United States, Society of, an organization formed at Philadelphia, 23 April 1896, by officers of the United States army, to keep in memory the hardships and heroism of the men who served in the Indian wars, which may now be regarded as of the past, and which had such an important and essential part in building up the States and Territories of the West. The society consists of three classes, the first composed of commissioned officers, active, retired, or honorably discharged, of the United States army, or of any State National Guard or militia, who may have served or may hereafter serve in a strictly military capacity in a section occupied by hostile Indians. The second class consists of lineal male descendants of officers who were either members of or eligible to the first class. The third class is open to non-commissioned officers and soldiers who have received a medal of honor or certificate of merit from the United States government for services in Indian wars, or who have been recommended for a commission, or specially mentioned by their immediate commanding officer for such services. The present officers are, Commander, Brevet Brigadier-General Judson D. Bingham, U. S. A., retired; Vice-Commander, Colonel John V. Furey; Recorder and Treasurer, Captain Henry Hobart Bellas, U. S. A.; Assistant Recorder, Lieutenant George R. Burnett, U. S. A.; Historian, Brigadier-General Charles King, U. S. A., retired; Council, Lieutenant-Colonel John A. Wilcox, U. S. A., retired; Major Henry E. Smith, U. S. A., retired; Captain Edward J. Conway, U. S. A.; Lieutenant John M. Walton, U. S. A., retired; Major Henry Pennington, late U. S. A.

Veterinary Medicine, according to the common acceptance of the term, is a knowledge of the external form, as well as the internal structure and economy, of the domestic quadrupeds and more particularly the horse. It includes the appropriate management of domestic animals, the nature, causes and treatment of their disorders and the art of shoeing such of them as may require it. (See FARRIER.) The word veterinary in its Latin equivalent was anciently used to denote a farrier, horse-doctor, or one who lets horses to hire.

History.—The first veterinary school was instituted in 1762 at Lyons; in 1766, that at

Alfort near Paris was opened. A similar institution was established at London in 1791, and in the year following one in Berlin. In Edinburgh, instruction in veterinary medicine began to be given by Dr. Dick in 1819, and in veterinary surgery in 1823. He erected college buildings soon after, collected a museum, and at his death in 1866 left all his fortune to the endowment of this institution. There is also another veterinary school in Edinburgh, and one in Glasgow. In London, besides the older institution now called the Royal Veterinary College, Camden Town, there is a second established at Bayswater in 1865. In 1844 the veterinary surgeons of Great Britain obtained a charter constituting them a corporation under the title of the Royal College of Veterinary Surgeons, and empowering them to appoint examiners and grant licenses or diplomas, the holders of which are members of this body (M.R.C.V.S.).

United States.—The first step toward systematic veterinary education in the United States was the granting of a charter in 1852 by the legislature of Pennsylvania, and the securing of a subscription of \$40,000, to serve in the organization of a veterinary school in Philadelphia. This school opened in 1853, but no students responded. In 1859-60 two students were secured, one of whom was a graduate of the Boston Veterinary College which had been chartered in 1855. Both of these schools had a short life, but the same cities have now each its veterinary school in connection with the University of Pennsylvania and Harvard respectively. Each of these schools has a matriculation examination and a three years' course of eight months each. In 1857 the New York College of Veterinary Surgeons was chartered and in 1875 the American Veterinary College was opened. These two New York city schools were maintained as proprietary institutions till 1899 when they were placed on a strictly university footing by consolidation under New York university. In the succeeding years veterinary schools sprang into existence in many of the large cities, Chicago, Kansas City, Cincinnati, Baltimore, Washington, Grand Rapids, Detroit, etc., all like the earlier schools in Boston, Philadelphia and New York, being private ventures, dependent on their financial returns, and with a curriculum of 10 or 12 months representing two years of five or six months each. State schools were established as early as 1868, Illinois taking the initiative.

Requirements.—The United States Veterinary Medical Association adopted in 1891 an article providing that all applicants for membership should be graduates of a recognized veterinary school with a curriculum of at least three years, of six months each, and a corps of instructors comprising at least four veterinarians. Nearly all the schools which had not already done so soon placed themselves in harmony with these requirements. The next step in advance came in 1895 when the New York legislature enacted that at least a high school diploma representing four years of high school work should be offered for admission to a veterinary school, that the veterinary curriculum should embrace three full years, and that only those who had met both requirements could be admitted to the regents' veterinary examination for license to practise in the State.

Army Service.—The United States army has

long had its nominal veterinarians, but many of these were uneducated men, appointed by political influence or advanced from the position of farrier major, and there was little to tempt professional men of character and ability into this service. The army veterinarian had practically no army status, no rights, no prospects. He was not even enlisted, there was no special provision for him during service and no pension if he had to retire disabled. In the session of Congress for 1900 the first step was taken for the improvement of the army veterinary service by enacting that the army veterinarian of the first grade must enter on the basis of an examination to be prescribed by the secretary of war, and that he shall have the pay and allowances of a second lieutenant of cavalry, while those of the second grade shall have \$75 a month and the allowances of a sergeant major.

State Regulations.—The first law restricting the practice of veterinary medicine was enacted in New York in 1886. In 1901, 12 States had veterinary medical laws. In 5 States a veterinary diploma does not admit to the practice of veterinary medicine, an examination being required in all cases: Minnesota, New York, North Dakota, Pennsylvania, Virginia. The following require for admission to the licensing examination: Minnesota, diploma from veterinary school. New York, full high school course, diploma of veterinary school with satisfactory standard. North Dakota, diploma from veterinary school. Pennsylvania, competent common school education, approved diploma from legally incorporated veterinary school having a course of three years. Virginia requires the licensing examination only. Illinois requires approved veterinary diploma or 3 years' practice, or examination. Ohio requires approved veterinary diploma or examination by State board. California and Maryland require veterinary diploma approved by State board. New Jersey admits on veterinary diploma submitted to unqualified local authority. Wisconsin admits on veterinary diploma or certificate submitted to unqualified local authority, and practitioners five years prior to 1887. Michigan registers veterinary medical degrees without examination and issues certificates of "veterinary surgeon" to those who pass the examinations of the State veterinary board. The other States and Territories have no laws on the subject.

Vétillart, vā-tē-yār, Marie Michel Henri, French civil engineer: b. Le Mans, France, 5 Sept. 1848. He was educated at the Ecole Polytechnique and the Ecole de Ponts et Chaussées, Paris, and in 1875-86 was resident engineer of the port and canals of Calais. In 1886-92 he was engineer-in-chief of the ports of Boulogne and Calais and has since occupied that position at Havre and the ports on the Seine. The new port of Calais, the improvement of the Calais canal, and the completion of the Boulogne break-water are among his more notable works, while to him may also be credited the first use of the water-jet for sinking the foundations of large piers and lock walls. He was a delegate to the International Maritime Congress at Washington in 1880. His writings include: 'Fonçage des pieux par injection d'eau' (1877); 'Fondations en terrains de sable des quais et écluses du port de Calais' (1880); 'La navigation aux Etats-Unis' (1892); in collaboration with Quinette de

Rochemont 'Les ports maritimes de l'Amérique du nord sur l'Atlantique' (1902); etc.

Vetiver, the rhizome and rootlets of the cuscus-grass (*Andropogon squarrosus*), of India, which, when dried, is light yellowish-brown in color, aromatic, balsamic and persistent in odor, suggesting sandalwood or myrrh. It is a tonic and stimulant drug, but is chiefly used as a source of vetiver oil, an ingredient in perfumery. The fibre of the grass is woven into fragrant baskets, and matting, which curtains house-openings, during the hot season of India, and is kept always wet.

Veto, in political science, the right of the executive to disapprove an act or resolution of the legislature. It may be absolute as in England, or qualified as in the United States, where the disapproval of the executive may be overridden by an extraordinary majority of the legislature or suspensive as in France, where the veto merely works a suspension of the law until re-passed by the legislature by an ordinary majority. In England the veto is a remnant of the more extensive legislative power formerly exercised by the sovereign, but which has been gradually cut down until only the negative power of disapproval is left. Since 1708 the right has never been exercised and the commentator Bagehot goes so far as to say that the sovereign would be bound to sign his own death warrant if the two houses of Parliament should send it to him. But the better opinion is that a royal prerogative is never lost by non-user and therefore the royal veto power still exists unimpaired, although the system of responsible cabinet government makes its use out of place. In the English colonies of America, except Maryland, Rhode Island and Connecticut, the royal veto was frequently employed in a manner to call out the strong protests of the colonies, and this abuse was one of the well known counts in the indictment of the British king contained in the Declaration of Independence. None of the revolutionary State constitutions except Massachusetts gave the executive even a qualified veto, nor was any provision for such a power made in the Articles of Confederation. The advantages of a qualified veto, as a check upon hasty and ill considered legislation, however, appealed to the framers of the Federal Constitution, and it was provided in Article I., Section 7, that every bill which shall have passed both houses of Congress shall be presented to the President for his approval, but if disapproved by him it shall be returned with his objections to the House in which it shall have originated. It is made obligatory upon the House to enter the objections upon the journal and proceed to reconsider the bill. If re-passed by two thirds of both houses by a yea and nay vote it shall become law in spite of the executive disapproval. If the bill is retained by the President for a period of ten days (Sundays excepted) it shall become law without his signature unless the adjournment of Congress in the meantime prevents its return. This last proviso in effect gives the President an absolute veto on all bills passed during the last ten days of the session since he has only to retain them in order to nullify them. This potent weapon is known as the "pocket veto" and was first extensively employed by President Jackson, who destroyed in this way Clay's bill for the distribution among

VETO ACT — VIARDOT-GARCIA

the States of the proceeds from the sale of the public lands. The veto power was used rather sparingly by the earlier Presidents. Washington vetoed two, Jefferson and the two Adamsses none, Madison six and Monroe one. The most extensive use of the veto was made by Jackson, who vetoed 12 bills, by Tyler and Pierce who vetoed nine each, by Grant who vetoed 43, by Johnson who vetoed 21, and by Cleveland who vetoed 301 during his first term. Most of those vetoed by Cleveland were private pension bills of little importance. Among the more important measures which have been killed by the executive disapproval were the bank bill and the internal improvement bill vetoed by Jackson, the two bank bills vetoed by Tyler, the Freedmen's Bureau, Civil Rights and Reconstruction bills vetoed by Johnson, the Inflation bill and the bill to reduce the President's salary from \$50,000 to \$25,000 vetoed by Grant, the silver coinage bill vetoed by Hayes and the Immigration bill vetoed by Cleveland. Until Pierce's administration but one bill was passed over the executive veto, the exception being a tariff bill vetoed by Tyler. Five were passed over Pierce's veto, 4 over Grant's, and 15 over Johnson's. No bills became law by the operation of the 10-day rule until Buchanan's administration. During Grant's two terms 136 bills became law by this rule, 18 during Johnson's term, 13 during Arthur's, and 283 during Cleveland's first term.

Among the precedents which have grown up in connection with the exercise of the veto power are: that the President has no power to veto a resolution proposing an amendment to the Constitution; that he cannot veto a bill without stating his objections thereto; that he cannot recall a veto, although this was done on one occasion by Grant; and that the two thirds of both Houses required to override the veto means two thirds of those present, and not two thirds of all the members composing the two Houses. An oft-suggested amendment to the Constitution is the proposal to empower the President to veto particular items in appropriation bills. This would enable the executive to eliminate objectionable "riders" from important appropriation bills without destroying the entire bill and thus bringing certain departments of the government to a standstill. At the present time all the State executives except that of Rhode Island are allowed a qualified vote over the acts of the legislature. Not until 1902 were the executives of North Carolina and Ohio given this power. In four States (Vermont, Connecticut, New Jersey, and Indiana) it includes only the right to demand reconsideration. In 27 States the veto may be overridden by two thirds, either of the members present or elected; in 3 States, by three fifths; and in the others, by a majority of those elected. In a considerable number the executive is empowered to veto any item of an appropriation bill, and in a few any section of other bills. Consult Mason, 'The Veto Power' (1890).

JAMES WILFORD GARNER,
Instructor in Political Science, University of Pennsylvania.

Veto Act, in ecclesiastical history, an act in the Scotch Church passed by the General Assembly 27 May 1834. It provided that when a patron issued a presentation to a parish in favor of a minister or probationer, the disapproval of

the presentee by a majority of male heads of families being communicants, should be deemed sufficient ground for his rejection, it being enacted that no objection should be valid unless the person making it was prepared to state before the Presbytery that he was not actuated by factious or malicious motives, but solely by a conscientious regard to the spiritual interests of himself or the congregation. The passing of this act was one of the causes of the disruption. See PRESBYTERIANISM.

Veuillot, vè-yô, Louis, French author: b. Boynes, France, 11 Oct. 1813; d. Paris 7 April 1883. He was of humble origin, and began his journalistic career in 1832, having obtained a position on one of the ministerial provincial papers. He rose from one position to another until in 1843 he became editor of 'L'Univers Religieux.' He visited Rome in 1838 and, influenced by the impressive religious services of Holy Week became an ultramontanist in his opinions, his conversion resulting in a series of religious romances, among which are: 'Pierre Saintine' (1840); 'L'Honnête Femme' (1844); etc. Among his other writings are, 'Les Pèlerinages de Suisse' (1838); 'Les Libres penseurs' (1848); 'Les Odeurs de Paris' (1866); 'Poetic Works' (1878); etc. He was the most uncompromising French ultramontanist of his day. Consult biographies by E. Veuillot (1883); and Cornut (1891).

Vevay, vè-vā', Ind., city, county-seat of Switzerland County; on the Ohio River, about midway, following the course of the river, between Louisville, Ky., and Cincinnati, Ohio. It has steamboat connections with all the Ohio River ports. It is in a fertile agricultural region in which the chief products are fruit, tobacco, and grain. The manufactures are flour, furniture, brick, tobacco and lumber products, and dairy products. There is one national bank and one state bank having a combined capital of \$100,000 and deposits amounting to \$280,000.

The place was settled in 1805 by a colony from near Vevay, Switzerland; in 1813 it was laid out, and in 1877 was chartered as a city. Pop. (1890) 1,663; (1900) 1,588.

Vevey, vè-vā, or Vevay, Switzerland, a town in the canton Vaud, beautifully situated at the northeast margin of the Lake of Geneva, 11 miles east-southeast of Lausanne. The beauty of the town and neighborhood attracts many foreign residents, and it has interesting literary associations in connection with Rousseau's 'Nouvelle Héloïse.' Pop. (1900) 11,781.

Vi'aduct. See BRIDGE.

Viardot, Louis, loo-è vè-är-dô, French art critic: b. Dijon 31 July 1800; d. Paris 5 May 1883. He studied law in Paris, entered journalism and was manager of the Theatre Italien 1831-41. In the last named year he founded with George Sand and Pierre Leroux the 'Revue Indépendante.' He wrote: 'History of the Arabs and Moors of Spain' (1851); 'The Traditional Rise of Modern Painting in Italy' (1840); 'The Museums of France' (1855); 'Spain and the Fine Arts' (1866); 'Wonders of Painting' (1868-9).

Viardot-Garcia, vè-är-dô gâr-thè'ä, Michelle Pauline, French opera singer, daughter of Manuel Garcia (q.v.): b. Paris 18 July 1821. She traveled extensively with her parents, and

VIATICUM — VIBURNUM

in 1839 made her début at London, playing in 'Otello' and in 'La Cenerentola.' She was married to Louis Viardot (q.v.) in 1840, but continued her operatic career until 1862 when she retired. She appeared in the great European cities with continued success throughout her stage life; created the parts of "Valentine" in 'Les Huguenots' and of "Fidès" in 'Le Prophète,' her voice, a mezzo-soprano of three octaves, enabling her to make an artistic triumph presentation of the roles; and after her retirement from the stage she engaged as a vocal teacher and in composition, in which her work is of importance. It includes the operettas 'Le dernier sorcier' (1867); 'Trop de femmes' (1869); etc., in addition to about 60 vocal melodies and other compositions.

Viaticum, a Latin word meaning provision for a journey, and used in the Roman Catholic Church to signify the Eucharist administered to patients beyond hope of recovery. Protestants also often take the Lord's Supper before death, but do not give this name to it.

Viatka, vē-ăt'kă, Russia. See VYATKA.

Viaud, vē-ō, **Louis Marie Julien**, French author, better known by his pseudonym "PIERRE LOTI": b. Rochefort 14 Jan. 1850. After a school education in his native town he entered the French navy in 1867, becoming midshipman in 1873, and resigning in 1898 with the rank of lieutenant. He has seen, in the course of his calling or otherwise, a great part of the world, and descriptions of foreign scenery figure largely in his works. He served with distinction in the Tonkin campaign, but incurred official displeasure by describing the cruel proceedings of French soldiers at Hué in a series of letters to the *Figaro* in 1883. In 1887 he was honored by admission into the Legion of Honor, and in 1891 was elected a member of the Academy, Zola being a rival candidate on the occasion. He has published many stories, tales, and sketches under the pseudonym "Pierre Loti," among them being: 'Aziyadé' (1879); 'Rarahu' (1880), reprinted in 1882 as 'Mariage de Loti'; 'Le Roman d'un Spahi' (1881); 'Fleurs d'Ennui' (1882); 'Pêcheur d'Islande' (1886), his chief work; for which he received the Prix Viète from the Academy; 'Madame Chrysanthème' (1887); 'Japonneries d'Automne' (1889); 'Au Maroc' (1890); 'Le Roman d'un Enfant' (1890); 'Fantôme d'Orient' (1892), a sequel to 'Aziyadé'; 'Le Désert' (1894); 'Jérusalem' (1895); 'La Galilée' (1895); 'Ramuntcho' (1897); and 'Figures et Choses qui Passaient' (1898). Many of these have been translated into English. His works are in general of an exotic character, dealing predominantly with the East, which he had studied during his naval service. Consult: Lemaitre, 'Contemporains,' Vol. III. (1888); Doumic, 'Ecrivains d'aujourd'hui' (1894).

Vibert, Jean Georges, zhōñ zhōrzh vē-bār, French painter: b. Paris 30 Sept. 1840; d. there 28 July 1902. He studied under Barrias and Picot and exhibited at the Salon for the first time in 1863. His work was chiefly in oils, but he also possessed great skill in water-colors. His drawing was carefully accurate and he excelled as a technician, but his work is frequently marred by crude coloring. He founded the Société des Aquaralistes Français, was

awarded medals at the Salon in 1864-7-8, and in 1882 became an officer of the Legion of Honor. Among his best-known works are: 'Gulliver' (1870); 'The Grasshopper and the Ant' (1875); 'Monseigneur's Antechamber' (1876); 'Apotheosis of M. Thiers' (1878); etc. He wrote: 'La science de la peinture' (1891). There are 4 good examples of this artist in the New York Metropolitan Museum of Art.

Viborg, vē'börg, Finland. See WINBORG.

Vibration. "Vibration is generally understood as the limited reciprocal motion of the particles of an elastic body or medium, in alternately opposite directions from their positions of rest or equilibrium." A vibration in England and Germany comprises a motion to and fro. In France a motion to or fro; hence the latter is one half of the former. When vibrations are comparatively slow, they are known as oscillations. In rods or strings, vibrations are distinguished as transverse, or longitudinal. The rate of transverse vibrations in rods is inversely proportional to the square of the length of the rod. When fixed at both ends, a rod vibrates in the same manner as a stretched string. When fixed at one end only, it vibrates either as a whole, or in segments. When bent into a U-shape, as is the case in the tuning fork, the rod divides into three vibrating parts by two nodes near the base. The vibration of plates and disks has been extensively investigated. For the laws governing these vibrations, see text-books in physics (sound). A vibrating bell follows the same law as a disk. The rate of vibration is directly proportional to the thickness, and inversely proportional to the square of the diameter. Rods vibrate longitudinally, either as a whole or in proportion to the numbers, 2, 3, 4, etc. At the points of maximum vibration a rod suffers no change of density. Enclosed columns of air vibrate longitudinally, by alternate condensations and rarefactions. Free vibrations in air, or gases proceed in straight lines from the point of disturbance. Forced vibrations, or vibrations modified by one another, or some other influence, produce circular, or elliptical revolutions of the particles of the liquid, or medium disturbed. (See laws of forced vibrations, text-books in physics.) The amplitude of a vibration is the maximum displacement of the vibrating particle. The phase of a vibration is any designated portion of this displacement. The laws of vibration are the basis of modern theories regarding sound, heat, light, and electricity. See these subjects, as well as WAVE.

Vibroscope, an instrument invented by Duhamel for recording the vibrations of a tuning fork, by means of an attached style on a piece of smoked paper gummed around a cylinder. The fork is made to vibrate, and the cylinder turned, the style making a mark whose waves correspond to the number of vibrations in a second.

Viburnum, a large genus of shrubs, or small trees, of the honeysuckle family, indigenous chiefly to the north temperate zone. Many species are cultivated for their ornamental flowers and fruits. The branches and leaves are usually opposite, the latter never being compound, but are diversely toothed and lobed, and generally assume brilliant hues in autumn.

VISCAINO — VICENZA

Viburnums are easily grown, but generally prefer a moist soil and sunny position; most of the American species living at the edges of open woodland. The most conspicuous of the genus both in flower and fruit are *V. opulus*, *V. tomentosum* and *V. alnifolium*. The two former are the source of the garden snowballs (q.v.). Among the American *viburnums* is the oval-leaved *V. dentatum*, or arrow-wood, so called because the Indians made arrow-shafts out of its soft, light wood, as well as from that of several other species such as *V. molle*. *V. lentago* is the sweet viburnum, sheep-berry or nanny-berry, an arborescent shrub keeping its oval, bluish-black drupes over winter. These fruits have a thin pulp, and are edible, and although somewhat insipid, are said to be palatable after having been frozen. *V. cassinoides* is the early-flowering withe-rod, with gray ascending branches. Its leathery, rather dull-green, ovate leaves, are sometimes used for what is called Appalachian tea. One of the commonest northeastern *viburnums* is the maple-leaved, or dock-mackie (*V. acerifolium*), a pretty spreading shrub growing under trees, with creamy plate-like cymes of flowers, fruits changing from red to dark blue, and 3-lobed maple-like leaves, which are downy beneath, and assume dark purple shades in the fall. The thin bark of root and stem of the black haw (*V. prunifolium*) yields a diuretic and tonic drug. This shrub forms thickets with dense foliage, composed of finely serrulate, small, oval leaves, and bears numerous clusters of flowers, succeeded by blue-black and glaucous drupes.

The small "wayfaring tree" of Europe (*V. lantana*) is often cultivated, and has elliptic foliage and bright-blue fruits, darkening to black. They are sweetish, mealy and mucilaginous, and are said to have been used as a remedy for diarrhoea and catarrh, and also for an ink. An inferior birdlime is extracted from the roots, and the acrid inner bark was used as a vesicant. The young shoots furnish stems for tobacco-pipes. The American wayfaring tree, is the hobble-hush (*V. alnifolium*), with leaves that are nearly orbicular, and turn to a deep wine-red in autumn, and handsome flowers having large, sterile ray-florets. It has long, flexuous, reddish branches, which are decumbent, and are constantly tripping up pedestrians in the shady woods which it frequents. This fact explains the popular name.

Viscaino, vēs-kā-ē'nō, **Sebastian**. See VIZCAINO, SEBASTIAN.

Vic'ar (from Latin *vicarius*, substituted, delegated), a representative, a vicegerent. The pope of Rome is called by Roman Catholics the "vicar of Christ on earth." A vicar-apostolic was formerly a bishop or archbishop of the Roman Catholic Church to whom the pope delegated some of his jurisdiction, but the term now denotes a titular bishop in a country where episcopal sees have not yet been established, or where the succession has been interrupted. A vicar-forane is a priest appointed by a bishop to exercise a limited jurisdiction in a particular town or district. A bishop may appoint one or more vicars-general to assist him in the work of his diocese. A vicar-capitular is elected by the chapter of a diocese, during the vacancy of the see, to hold the place of the bishop.

The term "vicar" as applied to a clergyman

in charge of a parish, originated in the appointment by religious corporations of a priest to perform the pastoral duties of some benefice which had become their property. When the properties of the religious houses were transferred to lay possession under Henry VIII. the vicar became the deputy or religious representative of the lay proprietor of the benefice, and his stipend was at the discretion of such proprietor. The vicar was and is inferior to the rector who has both the parsonage and the tithes. Parochial vicars are either perpetual, as in parishes, or temporary, the appointment of the latter being recalled at pleasure, or after a fixed time. In the Roman Catholic Church the designation is sometimes given in Europe to the assistant priest of a parish.

Vicente, vē-sēn'tā, **Gil**, Portuguese poet: b. 1470; d. after 1536. After study of jurisprudence at the University of Lisbon, he became connected with the court and there was the official provider of dramatic entertainment. Spanish was then much used at the court, and in that language Vicente composed 10 entirely and 15 partly, of his 42 works. He thus became a figure also in Spanish literature, and many of his dramas were presented in Spain. These are, however, in their material chiefly Portuguese. They have been arranged as *autos* (miracle-plays), comedies, tragi-comedies, and farces. The first class comprises 12 sacred works for performance at church festivals. Vicente's humor and abundant originality won for him the title of the Portuguese Plantus. He has been ranked with Camoens and Almeida-Garrett among the poets of the literature. The best collected edition continues to be that of 'Feio and Monteiro' (1834). Consult also: Von Faber, 'Teatro Español anterior á Lope de Vega' (1832); Ochoa, 'Tesoro del Teatro Español' (1838); 'Quarterly Review,' Vol. 79 (1846-7); Braga, 'Historia do theatro portuguez no seculo XVI.' (1870); De Ouguella, 'Gil Vicente' (1890).

Vicenza, vē-chēnt'zā, **Duke of**. See CAULAINCOURT, ARMAND AUGUSTIN LOUIS DE.

Vicenza, Italy, capital of a province of the same name, and an episcopal see, 42 miles by rail west of Venice, beautifully situated at the confluence of the Retrone with the Bacchiglione. It is surrounded by dry moats, now partly under cultivation, and by dilapidated walls. The city is well built, containing numerous fine mansions, many handsome streets, and several elegant squares, among which the Piazza dei Signori, with its campanile, not more than 20 feet square and yet more than 300 feet in height, is con-

VICHY — VICKSBURG

spicuous. The public buildings, though numerous, are somewhat monotonous, being almost all the work of Palladio, who was born here, or of scholars who imitated him. The most remarkable edifices are the Duomo, originally Gothic, but much injured by modern alterations; the Basilica, or Palazzo della Ragione, an ancient Gothic building; the Palazzo Prefettizio, in a rich and fanciful Corinthian style; the Teatro-Olimpico, regarded as the most curious if not the finest work of Palladio; the Museo Civico, the lyceum, public library, and numerous hospitals. The manufactures are silk, woolen, and linen tissues, leather, earthenware, hats, etc. Vicenza (*l'icentia*) was founded above a century before the Christian era, and became a Roman municipal town. Pop. (1901) 44,261.

Vichy, vē-shē, France, a town in the department of the Allier, in a beautiful valley of the river of that name, 32 miles southeast of Moulins. It was once a place of strength and has been celebrated since Roman times for its numerous thermal alkaline springs. The principal springs, nine in number, belong to the government. The waters are drunk on the spot, are used for baths, and are bottled for export; and the salts obtained from them by evaporation are manufactured into lozenges. The temperature of the springs ranges from 59° to 106°, and the chief constituent is bicarbonate of soda. The Vichy waters are efficacious in urinary and uterine affections, diabetes, rheumatism, gout, and similar disorders. The town is well provided with the usual accessories of a spa, and is a fashionable resort, annually visited by about 60,000 persons. Pop. (1901) 14,254.

Vickers-Maxim Gun. See ORDNANCE.

Vicksburg, vīks'bērg, Miss., city, county-seat of Warren County; on the Mississippi River, a few miles below the mouth of the Yazoo River, and on the Alabama & V., the Vicksburg, S. & P., and the Illinois C. R.R.'s; about 43 miles west of Jackson, the capital of the State, and 230 miles northwest of New Orleans. The city has regular steamboat connections with all the important Mississippi River ports. It is in an agricultural region in which cotton is one of the principal products. It is on a high bluff overlooking the river, and the streets, though not broad, are regular, well-kept, and have a number of shade trees. The chief manufacturing establishments are cottonseed-oil mills, planing mills, railroad shops, foundries, and machine shops. In 1900 (government census) there were 65 manufactories with a combined capital invested in plants of \$1,360,890; and employing 1,222 persons, to whom were paid annually \$532,734. The cost of raw material was \$949,387, and the annual value of the products was \$1,876,843. The city has an extensive trade in cotton and lumber products, and general produce.

The principal public buildings are the government building, the county court-house, the Charity Hospital, the churches and schools. The educational institutions are a public high school, Saint Aloysius College (R.C.), for boys, Cherry Street College (colored), founded in 1892, Saint Francis Xavier's Academy, public and parish schools for both races, and school libraries. There is here a National Cemetery which contains 16,727 graves, of which 12,723 are of unknown dead. The eight banks have a combined capital of \$615,000. The government is vested in

a mayor and board of aldermen, consisting of eight members.

Vicksburg was laid out as a city on the plantations of John Lane and William Vick. In 1840 it was incorporated. It soon became a prominent distributing centre for the interior towns and a shipping point for the products of the plantations. It came into great prominence during the Civil War. (See VICKSBURG, CAMPAIGN AND SIEGE OF.) The city suffered some damages in 1876, when the river cut through a neck of land. The government has since expended about \$2,000,000 in efforts to divert the Yazoo River, and also to restore the harbor. Pop. (1880) 11,814; (1890) 13,373; (1900) 14,834.

Vicksburg, Military Operations Against and Siege of. The advisability of fortifying Vicksburg to aid in the closing of the Mississippi River was apparent to the Confederates early in 1861, but not until after the fall of Fort Donelson, in February 1862, were any steps taken to garrison and fortify the place. Then Gen. Bragg sent one regiment to occupy it and in March guns and ammunition were sent from Pensacola. In April Gen. Beauregard recommended that works should be constructed on the bluffs commanding the river for 40 guns and that the place should be garrisoned by 3,000 men. Work was begun late in the month and six batteries had been completed by 18 May, on which day Commander S. P. Lee, commanding the advance of Farragut's fleet from New Orleans, appeared before the place and demanded its surrender, which was refused. Two days later Farragut arrived with additional vessels and transports carrying 1,500 men and a battery, under command of Gen. Thomas Williams; a reconnaissance was made, Williams decided that his force was too small to accomplish anything, upon which Farragut, with the greater part of his fleet, returned to New Orleans, and Williams took his troops back to Baton Rouge. Upon his return to New Orleans Farragut was met by instructions from the Navy Department to clear the Mississippi, which, at the time, was obstructed only by the batteries of Vicksburg. A mortar flotilla of 16 vessels, each with a mortar, under Commander D. D. Porter, was started and reached Vicksburg 20 June, and on the same day Farragut left Baton Rouge with three vessels of war and seven gunboats, carrying in all 106 guns, and a fleet of transports carrying Williams' brigade of 3,000 men and two batteries. Farragut reached Vicksburg on 25 June, and Williams' brigade was landed on the Louisiana shore, and with the assistance of 1,200 negro laborers began digging a canal across the peninsula opposite the city. With his 106 guns and the 16 mortars of Porter, Farragut attacked the Confederate batteries, but they were so high, more than 200 feet above the river, that little or no damage was done them. At the time the place was held by Gen. Earl Van Dorn with 16,000 men, and 40 heavy guns were in position. Failing to silence the batteries, the mortar flotilla, with one vessel and two gunboats, were left below, and early on the morning of the 28th Farragut, with two vessels and five gunboats ran the batteries. The firing lasted about two hours and his loss was 15 killed and 42 wounded. The damage to his fleet was not serious and he had inflicted no damage on the Confederate works.

VICKSBURG

Meanwhile a Union fleet, under Capt. C. H. Davis, had descended the Mississippi and on 1 July joined Farragut above Vicksburg. A sudden rise in the river destroyed the canal Williams was digging across the peninsula, he proposed to return to Baton Rouge and Farragut was expecting an order to return with him when, 15 July, a startling incident took place. Early in the morning some light gunboats of Davis' flotilla had been sent up the Yazoo to obtain information of the Arkansas, an iron-plated ram known to be building up that stream. The Arkansas was unexpectedly encountered and the Union gunboats steamed back, closely followed by the Arkansas. But one of Farragut's vessels had steam up and the Confederate ram passed directly through his entire fleet, delivering her saucy broadsides, and without injury proceeded to the shelter of the batteries of Vicksburg. Farragut was much chagrined and at once determined to run past the batteries that night and endeavor to destroy the ram in the passage. He passed the batteries with a loss of 20 killed and wounded, but did no damage to the Arkansas. On 20 July Farragut received orders to return to New Orleans. He waited until Williams embarked his men and on the 27th started down the river, Davis on the same day going up the river to Helena. During the two months since the fleet had appeared before Vicksburg the Confederates had but 22 killed and wounded and no material damage had been done to their batteries.

The next movement against Vicksburg was by Gen. Grant, who, 2 Nov. 1862, moving from Corinth, Mississippi, and Bolivar, Tenn., with 30,000 men drove the Confederates from Grand Junction and followed along the line of the Mississippi Central railroad to attack Vicksburg from the rear. Gen. Pemberton, commanding the Confederate forces, fell back behind the Tallahatchie and on the 13th Grant occupied Holly Springs and made it a depot of supplies. Another advance was made, Pemberton fell back to Grenada and Grant halted south of Oxford until he could repair the railroads in his rear, and while so engaged heard definitely that Gen. McClernand had been given command of an independent expedition to start from Memphis and open the Mississippi, and for which McClernand had already organized and sent some regiments to Memphis. Grant says: "I doubted McClernand's fitness and I had good reason to believe that in forestalling him I was by no means giving offense to those whose authority to command was above both him and me." So, to forestall McClernand, Gen. Sherman, 8 December, was sent back to Memphis to take charge of the expedition which had been specially assigned to McClernand, by the President and Secretary of War. Grant was about to advance from Oxford on Grenada when the Confederate cavalry, under Forrest, broke up the lines of communication in West Tennessee, and on the morning of 20 December Gen. Earl Van Dorn, at the head of 3,500 cavalry, dashed into Holly Springs, captured a greater part of the garrison and burned Grant's accumulated supplies (see HOLLY SPRINGS). These two raids compelled Grant to fall back, and Sherman was notified not to sail from Memphis, but he did not receive the notification in time; the day Holly Springs was captured he started from Memphis,

with four divisions of 30,000 men, moved down the river, accompanied by Porter's fleet, and on the 29th assaulted Chickasaw Bluffs, on Yazoo River, and was repulsed with a loss of 1,213 killed and wounded, and 563 missing. (See CHICKASAW BAYOU, OR BLUFFS, BATTLE OF.) Gen. McClernand arrived at Memphis, after Sherman's departure, and following down the river assumed command and escorted by gunboats, under Admiral Porter, ascended the Arkansas River and captured Fort Hindman (q.v.). On 18 December Grant had received orders from Washington to divide his command into four army corps, with Gen. McClernand to command one of them and to be assigned to that part of the army which was to operate down the Mississippi. This materially interfered with his plans, as he had put Sherman in command of the river expedition, so after falling back to Grand Junction, Grant decided to go down the Mississippi, unite a part of his forces with those under McClernand and assume command of the whole. The army was divided into four corps commanded by Gens. McClernand, Sherman, McPherson, and Hurlbut, and Grant now planned a new campaign to get below Vicksburg and operate from the south. McClernand's and Sherman's two corps were moved from the mouth of the Arkansas to Young's Point to cut a canal across the peninsula opposite Vicksburg, on very near the line followed by Williams, and by the aid of this canal it was hoped to get below Vicksburg and land on the east bank of the Mississippi. The work was prosecuted from 22 January to 7 March 1863, much hard and exhausting labor being expended upon it, when there was a sudden rise in the river, the entire peninsula was flooded and work on the canal abandoned; it was an admitted failure. An attempt was made to reach the Mississippi south of Vicksburg, from Lake Providence, La., 60 miles above the city, through Bayou Macon, the Tensas and Washita rivers into Red River and then up the Mississippi to Vicksburg. This project was abandoned at the end of March. Meanwhile efforts were being made to reach the high ground north of Vicksburg by cutting the levees at Yazoo Pass, nearly opposite Helena, Ark., and by way of the Coldwater and Tallahatchie rivers gain the Yazoo River. A like movement was attempted through Steele's Bayou into Deer Creek, to reach the Sunflower River and through it the Yazoo above Snyder's Bluff. (See YAZOO PASS AND STEELE'S BAYOU EXPEDITIONS.) All these efforts to flank the position on the right having failed Grant once more turned his attention to getting south of Vicksburg, by a series of bayous running from Milliken's Bend past Richmond to New Carthage, and on 29 March McClernand was ordered to move his corps toward Richmond and New Carthage, with a view to making his way to the banks of the Mississippi below Vicksburg and the batteries at Warrenton and Grand Gulf. At the same time Grant suggested to Porter that the gunboats run past the Vicksburg batteries to attack those at Grand Gulf and cover a landing in that vicinity. On the night of 16 April Porter with eight gunboats, three transports with supplies and a number of barges filled with coal ran past the batteries, and although under fire for nearly two hours and struck many times the gunboats were uninjured. One of the trans-

VICKSBURG

ports was abandoned and burned by her commander and a coal barge was sunk. No one was killed and there were but a few wounded. On the night of the 22d six transports protected by cotton bales, loaded with supplies, and have 12 barges in tow, loaded with rations, ran the batteries, five getting through more or less disabled, while one was sunk. Some of the barges were lost. By the 27th McClernand's corps was all at Hard Times on the Mississippi below Vicksburg and McPherson's was closing up. The plan was to have the navy silence the guns in Grand Gulf, and to have as many men as possible ready to land under cover of the fire of the navy and carry the works by storm. At 7 A.M. 29 April Porter with seven gunboats carrying 81 guns left his anchorage at Hard Times and steamed down the river, followed by transports and flat-boats carrying 10,000 men of McClernand's corps. Porter opened his guns upon the Grand Gulf batteries about 8 A.M. and by 1.30 P.M. the Confederate guns had not been silenced by the 2,500 shot thrown against them, and the fleet withdrew after a loss of 19 killed and 56 wounded. Grant now determined to move still farther down the river and flank Grand Gulf. McClernand landed his men at Hard Times and marched across the point opposite Grand Gulf and three miles down the river during the night, and Porter with his fleet of gunboats and transports dropped down to the same point. Grant had heard of a good landing on the east bank of the river, and at daybreak of the 30th transports and gunboats began ferrying the troops across to Bruinsburg, 10 miles below Grand Gulf and 32 in a straight line below Vicksburg; and at noon McClernand's four divisions of 18,000 men had been landed. At 4 P.M. McClernand pushed out 12 miles, fought the Confederates next morning at Port Gibson (q.v.), defeated them, and caused the abandonment of Grand Gulf. While Grant was crossing the river at Bruinsburg, Sherman whose corps had been left at Young's Point, went up the Yazoo River with a division, accompanied by some of Porter's gunboats and made a strong demonstration on Snyder's Bluff, on the Yazoo, 12 miles above Vicksburg. On 3 May Grant rode into Grand Gulf. He says: "I resolved to get below Vicksburg, unite with Banks against Port Hudson, make New Orleans a base and, with that base and Grand Gulf as a starting point move our combined forces against Vicksburg. Upon reaching Grand Gulf after reducing its batteries and fighting a battle, I received a letter from Banks informing me that he could not be at Port Hudson under 10 days and then with only 15,000 men. The time was worth more than the reinforcements. I therefore determined to push into the interior of the enemy's country." (See PORT HUDSON, SIEGE OF.) Grant advanced toward the rear of Vicksburg, defeated the Confederates at Raymond (q.v.) 12 May; Jackson (q.v.) 14 May; and then marched westward on Vicksburg. The battle of Champion's Hill (q.v.) was fought on 16 May, and Gen. Pemberton, after his defeat withdrew his army across Big Black River. Grant followed on the 17th. Pemberton tried to hold the bridge head on the east side of the stream, but his troops became demoralized and fell back across the bridge, losing 18 guns and 1,750 prisoners. Pemberton's troops on the west bank of the river covered the dis-

orderly flight, enabling most of the troops on the east side to get over, and Pemberton ordered all his command to withdraw within the intrenched lines of Vicksburg. The fortified position at Snyder's Bluff on the Yazoo was abandoned and the garrison brought into the city, and the outpost at Warrenton, on the south, was drawn in. About 102 pieces of field artillery were also put in place around the exterior line of defense, which was about eight miles in length, and held by 19,000 effective men. On the river front were 40 heavy guns, with about 700 men. On the 18th Grant closed in and on the right Sherman occupied Ilaines' and Snyder's bluffs, and Grant established his base on the Yazoo River above Vicksburg. McPherson, on the left of Sherman, held ground on both sides of the Jackson road, and McClernand south of McPherson, extended toward Warrenton. The movement into position was accompanied by constant skirmishing, which continued during the morning of the 19th. From the fact that the Confederates had been defeated in several engagements and were so demoralized at the affair on the Big Black, Grant concluded that Pemberton's entire force was so demoralized that it would yield to a vigorous attack and at 2 P.M. of the 19th ordered a general assault. Sherman on the right advanced and after hard fighting gained the ditch of the works near the Graveyard road, but could go no farther and was repulsed with a loss of 942 killed and wounded. McPherson and McClernand had over a mile to advance, and made part of it, under a heavy fire when darkness set in and they bivouacked. The next two days were spent in strengthening the position and in making roads in rear of the army to connect with its new base on the Yazoo River.

As Gen. J. E. Johnston was but 50 miles in Grant's rear collecting a force to assist Pemberton, it seemed advisable to Grant that he should press matters and he ordered a general assault for the 22d. Early in the morning a furious cannonade was opened on the Confederate lines, in which Porter's fleet joined and at 10 A.M. Grant's 40,000 men threw themselves against the 20,000 Confederates covered by intrenchments. As the leading columns went forward not a Confederate was to be seen, but when they had come within easy range the Confederates rose up along the more than three miles of assault and delivered volley after volley, striking down the heads of the assaulting columns, and at the same time the reserves advanced and fired over the heads of those in the trenches. Every field gun double shot with grape and canister joined in the defense. Sherman and McPherson, in some places, reached the ditch of the Confederate works and planted their colors on the parapet, but in general the assault was repulsed and the troops fell back under shelter. On the left McClernand succeeded in carrying a part of the Confederate line, but its defenders from a line 100 yards in rear drove him out; but he maintained his position in the ditch and planted some of his colors on the parapet. At noon McClernand reported to Grant that he held the Confederate works and that support on the right would be followed by complete success, upon which Sherman and McPherson were both ordered to renew the assault. The assault failed. Grant says it only served to increase the casual-

VICO — VICTOR

ties without giving any benefit whatever. The firing continued till dark, when the troops that had reached the Confederate works were withdrawn. The Union loss in this assault was 502 killed, 2,550 wounded, and 147 missing. The Confederate loss was not over 500.

The result of the assault convinced Grant that Vicksburg could be taken only by siege, which was immediately begun. The investing line was 15 miles long, extending from Haines' Bluff to Vicksburg, thence to Warrenton on the south. Artillery was put in commanding positions, and rifle-pits and covered ways constructed to connect the entire command by the shortest route. In no place were the opposing lines more than 600 yards apart, and the distance was gradually reduced. The work was pushed forward as rapidly as possible, and when an advanced position was secured and covered from the fire of the enemy, the batteries were advanced. The work had steadily progressed from the 23d of May and by 25 June a sap had been run to the Confederate parapet and a mine exploded just north of the Jackson road and a lodgment effected inside the works by two Union regiments, which, however, were driven out next day. Another mine was exploded on 1 July, but no attempt was made to take advantage of it. Three other mines were exploded at other points and by both sides, by which men were covered and killed and buried at the same time. The lines now were very close and the casualties on each side were from 10 to 100 every day. By the 30th of June Grant had received reinforcements raising his force to 71,000 men and he had in position 248 guns—220 of which were field pieces and 28 heavy naval guns. A large part of the army was put under Sherman's command and disposed to resist the advance of Gen. Johnston's army from Jackson to relieve Pemberton. By 1 July Grant's approaches were close up to the Confederate works and at many points the approaches had been pushed to within from five to 100 yards of the enemy and orders were given to make preparations for a general assault on the 6th. But Pemberton had concluded, after consultation with his division commanders that it was best to surrender, as an assault was inevitable and his men too much enfeebled by hunger and constant duty to meet it, and on the 3d displayed white flags on his works and sent a note to Grant proposing an armistice to arrange terms of capitulation. Terms were agreed on and at 10 A.M. 4 July, the Confederate troops marched out, each division in front of its works, stacked arms, laid their colors upon them and then returned toward the town, where they were subsequently paroled. The prisoners surrendered numbered 31,600, together with 172 pieces of artillery, 67 of which were siege guns, about 60,000 muskets and a large amount of ammunition.

Before the surrender had been completed on the 4th Sherman, with 48,000 men had been ordered to march against Johnston, who with over 30,000 men had advanced as far as the Big Black to relieve Pemberton. Johnston heard on the night of the 4th of Pemberton's surrender and next morning retreated to Jackson, closely pursued by Sherman who besieged Jackson and captured it (see JACKSON, SIEGE OF). Grant's losses in his entire campaign from April 30 and including Sherman's siege of Jackson, were 1,243

killed, 7,095 wounded, and 535 missing. The Confederate losses in killed and wounded are not known, but in killed, wounded and captured they aggregated full 40,000 men. XV., XVII., XXII., XXIV., XXV., XXVII.; Greene, 'The Mississippi'; Grant's 'Personal Memoirs,' Vol. I.; Sherman's 'Memoirs,' Vol. I.; The Century Company's 'Battles and Leaders of the Civil War,' Vols. II., III.

E. A. CARMAN.

Vico, Francesco de, frän-chës'kō dā vē'kō, Italian astronomer: b. Maccrata, 19 May 1805; d. London 15 Nov. 1848. He entered the Society of Jesus in 1823, studied and taught at the Roman College, in 1835 was appointed assistant, and in 1839 chief, of the observatory at Rome. A work by which he gained high reputation was a course of observations for the purpose of ascertaining the time of rotation of the planet Venus upon its own axis. He subsequently turned his attention toward the satellites and inner ring of Saturn, and also toward the nebulae, upon which he wrote some detailed reports. When the Jesuits were driven from Rome by the revolution of 1848, he went to England, and afterward came to the United States. He had accepted a proposal to become director of an observatory to be erected under his auspices in the State of New York, went to England to obtain the necessary instruments, and died there. He discovered several comets.

Vico, Giovanni Battista, jō-vā'n'ē bāt-tēs'ta, Italian jurist and philosopher: b. Naples 23 June 1668; d. 20 Jan. 1744. In 1697 he was appointed professor of rhetoric at the University of Naples, and in 1735 historiographer-royal. Although almost unknown to Europe at the time of his death, a work which he published in 1721, 'Principi d'una Scienza Nuova d'intorno alla Commune Natura delle Nazioni,' has since caused him to be regarded as one of the founders of philosophy of history. He was one of the first to deny the historical reality of the mythical personages which figure in early Greek and Roman history, and anticipated Wolf in his history of the origin of the Homeric poems. Different opuscles of his were collected by Carlo Antonio Rosa, with an autobiography (1818); and a French edition of his works was published by Michelet (1836). There is also a German translation. Consult: Flint, 'Vico' (1884).

Victor, Claude Perrin, vīk-tōr klōd pē-rān, Duc DE BELLUNO, marshal of France: b. La Marche, Vosges, 7 Dec. 1764; d. Paris 1 March 1841. At 17 he enlisted in a regiment of artillery, and served eight years as a common soldier. He re-enlisted in 1792, and for his conduct at the siege of Toulon in 1793 was made general of brigade. He served with distinction in the Italian campaigns, and Napoleon gave him the marshal's baton on the field of Friedland (1807), and later the title of Duke of Belluno. He commanded the 1st corps d'armée in Spain 1808-12, and lost the battles of Talavera and Barrosa, and while commanding the 9th corps d'armée in the fatal Russian campaign covered the crossing of the Berezina. He afterward lost the emperor's favor by neglecting to occupy the bridge of Montereau-sur-Yonne, and adopted the cause of the Bourbons, Louis XVIII. giving him the command of the 2d division, and the presidency of the military com-

VICTOR—VICTOR EMMANUEL

mission appointed to try such officers as had deserted to Napoleon during the "Hundred Days." He was minister of war 1821-3. His 'Mémoires Inédits' was published in 1846.

Victor, Orville James, American author: b. Sandusky, Ohio, 23 Oct. 1827. He was graduated at the Theological Institute, Norwalk, Ohio, in 1847, was on the editorial staff of the Sandusky 'Daily Register' (1851-6), and of the 'Cosmopolitan Art Journal' (1856-61). He has edited several compilations and has written: 'History of the Southern Rebellion'; 'History of American Conspiracies'; and popular biographies of John Paul Jones, Winfield Scott, Garibaldi, and others.

Victor, the name of three popes, as follows:

Victor I., Saint. He was of African birth and succeeded Saint Eleutherius as pope about 190. He threatened to excommunicate all bishops refusing to accept the Roman computation of Easter, but was dissuaded from this by Irenæus. He was concerned in the Monachian controversy also, and excommunicated the Monachian leader Theodotus. He was succeeded by Saint Zephyrinus about 202.

Victor II. (GEBHARD, gëb'härt). He was a son of a count of Tollenstein and Hirschberg and became bishop of Eichstädt. His election to the pontificate in 1051 was opposed by his friend, the German emperor Henry III., who did not wish to lose his counsels. He was noted for his zeal in suppression of vice and his opposition to simony. He was followed by Stephen. X.

Victor III. (DESIDERIUS, dës-i-dë'rî-üs). He belonged to the noble family of Benevento and early in life entered a Benedictine monastery in opposition to the wishes of his family. In 1058 he became abbot of Monte Cassino and the next year was made a cardinal. As papal vicar in southern Italy he conducted the negotiations between the Pope and the Normans in Sicily. He was elected to succeed Gregory VII., much against his will, and accepted the pontificate only after the lapse of a year. His pontificate lasted through six months of 1086 and 1087, but within this short period he closely followed out the policy of Gregory VII.

The title of VICTOR IV. was assumed by two antipopes, Cardinal Gregorio Conti in 1138, and Cardinal Octavian in 1159-62.

Victor Amadeus I., äm-a-dë'üs, king of Sardinia. See SAVOY, HOUSE OF.

Victor Amadeus II., king of Sardinia: b. 1726; d. 1796. He succeeded his father, Charles Emmanuel III. on the throne in 1773. He founded the Academy of Sciences at Turin, and displayed much zeal for the welfare of his subjects. His hostility to the Revolution in France provoked a contest with that country, in the course of which Nice, Savoy and portions of Piedmont were secured by France.

Victor Emman'uel I., king of Sardinia, son of Victor Amadeus (q.v.): b. 24 July 1759; d. Moncalieri, Italy, 10 Jan. 1824. He succeeded to the throne on the abdication of his brother, Charles Emmanuel IV., 4 June 1802. His territories on the mainland were occupied by the French and he therefore resided at Cagliari until 1814, when his possessions were restored to him by the Congress of Vienna, and the duchy of Genoa was added to his kingdom.

He introduced various reactionary measures which resulted in a revolution, and on 13 March 1821 he abdicated in favor of his brother Charles Felix.

Victor Emmanuel II. (VITTORIO EMANUELE, vë-tö'rë-ö ä-man-oo-ël'ä), king of Sardinia 1849-61 and of Italy 1861-79: b. Turin 14 March 1820; d. Rome 9 Jan. 1878. He was the eldest son of Charles Albert (q.v.), king of Sardinia, was trained in military science, and in the campaign of 1848-9 against Austria was commander of a brigade. After the battle of Novara, Charles Albert abdicated in favor of his son, Victor Emmanuel, who thereupon became king of Sardinia, 23 March 1849. The new king soon showed himself faithful to the constitution in his negotiations with Austria, and finally received the title of the honest king (*Re galantuomo*). With the aid of wise ministers, among whom was the celebrated Cavour, he regulated the finances, reorganized the army, secularized the church property, gave a stimulus to trade and commerce, and prepared his country to assert its independence in an effort to unite Italy. To this end, and in order that Sardinia might claim to be a power in European politics, he sent 17,000 troops to the Crimea (1855) to fight with France and England against Russia. In the Congress of Paris (1856) Sardinia took part, and her demands that Austria should deal more leniently with the Italian provinces which she occupied were supported by France and England. Cavour also entered into an alliance with Napoleon III. when they met at Plombières, securing France as an ally against Austria when that power invaded Piedmont 23 April 1859. Several of the Italian states having now declared in favor of Victor Emmanuel as their king, he took command of the army, and entered upon a campaign against Austria with Napoleon III. as his ally. After a series of engagements, ending with the victory of Magenta, he entered Milan with Napoleon III. The Austrians were routed, and Lombardy annexed to Sardinia after the battle of Solferino, when suddenly Napoleon III. closed the war by the treaty of Villafranca 11 July 1859 which frustrated the hope of making a united Italy. The Italians declared their cause was betrayed by this treaty, and Cavour, disheartened, retired for a time into Switzerland. This period of gloom soon passed, however, when Tuscany, Modena, Parma, and the Papal States declared for Victor Emmanuel as their king. This was followed by the conquest and annexation of Sicily by Garibaldi; and as the Sardinian king was now master of the peninsula, with the exception of Rome and Venetia, it was decreed by the senate 5 May 1860, that he should receive the title of King of Italy. It had been a great personal loss to Victor Emmanuel when he was required to cede Nice and Savoy, the cradle of his family, to France; and the death of Count Cavour in 1861 was at once a grief to the king and something that seemed, for the time, a national disaster. Yet, although deprived of his favorite minister, Victor Emmanuel gave constant attention to the material interests of Italy, so that roads were constructed, the coinage was recast, tithes suppressed, and the ecclesiastical establishments placed under the control of the state. Nor did he slacken his efforts to obtain the complete freedom of Italy from foreign occupation, and in

VICTOR EMMANUEL — VICTORIA

this was greatly favored by circumstances. In the Austro-Prussian war in 1866, the Italian troops took the field in alliance with the latter power, and although checked at Custoza and Lissa, Victor Emmanuel received the cession of Venetia 7 Nov. 1866 as the result of the Austrian defeat at Sadowa. Rome still remained in the hands of the Papal authorities, supported by France; but when the Franco-Prussian conflict began, in 1870, the French troops were withdrawn, and on the 20th of September Victor Emmanuel entered Rome, which became thenceforward the capital of Italy. The efforts of the king were now directed to the development of Italy and the maintenance of peace through a reconciliation with Austria and an alliance with Germany. His death produced profound sorrow throughout Italy, for he was beloved not less for his honest manliness of character than for the benefits which his courage and wisdom had conferred upon his country. Consult: Rufer, 'König Victor Emanuel' (1878); Godkin, 'Life of Victor Emanuel II.' (1879); Massari, 'La vita ed il regno di Vittorio Emanuele II.' (1880); Capeletti, 'Storia di Vittorio Emanuele II. e del suo Regno' (1894); Stillman, 'The Union of Italy' (1898).

Victor Emmanuel III., king of Italy: b. Naples 11 Nov. 1869. He succeeded to the throne 29 July 1900, as a result of the assassination of King Humbert, his father (q.v.). As Prince of Naples he entered the army as sub-lieutenant in 1887, in 1890 became colonel and commander of the 1st infantry at Naples, in 1892 major-general, in 1894 lieutenant-general, in 1897 commanding general at Naples. On 24 Oct. 1896 he was married to the Princess Helena (b. 1873), daughter of Prince Nicholas of Montenegro. They have two daughters, Princess Yolanda Margherita, b. 1901, and Princess Mafalda, b. 10 Nov. 1902. He is a fine numismatist, and a 'Corpus Nummorum Italicorum' began to appear under his direction in 1903. Consult Basletta, 'Vittorio Emanuele III.' (1901).

Victoria, vik-tō'r-i-a, Queen of the United Kingdom of Great Britain and Ireland, and Empress of India: b. Kensington Palace, London, 24 May 1819; d. Osborne, Isle of Wight, 22 Jan. 1901. She was the only child of Edward, Duke of Kent, fourth son of George III., by Mary Louisa Victoria, youngest child of Francis Frederick Antony, duke of Saxe-Coburg-Saalfeld, and widow of Prince Ernest Charles of Leiningen. On 24 June she was baptized by the names of Alexandrina Victoria. The reigning sovereign was George III., and there stood between her and the throne the Prince Regent, afterward George IV., the Duke of York, the Duke of Clarence, afterward William IV., and her father. On 23 Jan. 1820, her father died, only nine days after the death of George III. The formal education of the princess began in 1824, her first teacher being Fräulein Lehzen, but from 1827 the chief direction of her studies was intrusted to the Rev. George Davys, afterward bishop of Peterborough. On the death of George IV. in June 1830 she became heir-presumptive to the throne. She was confirmed at the Chapel Royal, Saint James, 30 July 1835, and in May of the following year she first met her future husband. The death of her uncle, William IV., 20 June 1837, raised her to the throne, nearly a

month after she had attained her majority. She elected to be known by the name of Victoria. The young queen, daughter of a Whig or even Radical father, held Whig principles herself, and soon learned to place implicit confidence in Melbourne, head of the Whig government, and to look to him for political guidance. For many years she was regarded with somewhat unfriendly feelings by the Tories, but her chief favorite among the statesmen with whom she afterward came into contact was a Tory, or at least a Conservative, Benjamin Disraeli. She opened her first Parliament 20 Nov. 1837. Her coronation took place in Westminster Abbey 28 June 1838.

On 15 Oct. 1839, Victoria was engaged to her cousin, Prince Albert, youngest son of the Duke of Saxe-Coburg, and on 10 Feb. 1840 their marriage was solemnized in the chapel of Saint James' Palace. In July of that year a bill was passed making Prince Albert regent in case the queen should not survive her first confinement, and on 21 November her first child, the Princess Royal, was born at Buckingham Palace. Melbourne was defeated in the House of Commons in 1841 on a vote of no confidence, and Parliament was dissolved. The Tories were triumphant at the polls, and Sir Robert Peel, whom the queen at first distrusted but soon learned to like, became premier. On 9 Nov. 1841, a male heir to the throne, afterward Edward VII., was born at Buckingham Palace. Victoria made her first visit to Scotland in September 1842, and in the following year she left Great Britain for the first time, to visit Louis Philippe at Eu and King Leopold at Brussels. When Peel in 1845 determined on the repeal of the corn-laws the queen gave him her whole-hearted support. Lord John Russell formed a ministry, with Lord Palmerston as foreign secretary, a position in which he gave her much anxiety. In 1848, the year of revolution, she made her first stay at Balmoral, which was afterward to be her residence during a large part of each year. She had already acquired Osborne, in the Isle of Wight (1844). She visited Ireland for the first time in 1849, and on that occasion the Cove of Cork, where she landed, was renamed Queens-town in her honor. In 1848 and the three following years her dislike of Palmerston's foreign policy steadily increased, but in December 1851, his wholly unwarranted approval of the *coup d'état* in France caused Lord John Russell to remove him from office. During the period of the no-papery outcry which followed the re-establishment of Roman Catholic bishoprics in England in 1850, the queen steadily discounted Protestant bigotry. Lord John Russell was defeated in 1852, and Lord Derby formed a new ministry with Disraeli as chancellor of the exchequer and leader of the lower House. Derby resigned in December, and at the queen's suggestion Lord Aberdeen formed a coalition ministry, including Palmerston and Russell. During the war with Russia (1854-6) the conduct of the queen won universal commendation. Early in 1855 Aberdeen was defeated on the question of the conduct of the war, and the queen was reluctantly compelled to ask Palmerston to form a ministry. The Victoria Cross, for acts of conspicuous bravery in battle, was instituted at her instance in 1856. In 1857 Prince Albert was created Prince Consort by

VICTOR EMMANUEL II.

VICTORIA

letters-patent, and in the following year Palmerston was succeeded in the premiership by Lord Derby. Victoria interfered with excellent effect in the matter of the proclamation issued to her Indian subjects in 1858, and she created the new order of the Star of India the year following the Mutiny to reward native loyalty and eminent services in that country. The elections of 1859 placed Derby in a minority and compelled her to accept another Palmerston-Russell ministry. She at once came into conflict with them on the Italian question, in which her sympathies were with Austria. Distrust of the intentions of Napoleon III., which she fully shared, led to the foundation of the volunteer force in 1859, and in 1860 she formally inaugurated the National Rifle Association at Wimbledon.

On 16 March 1861, her mother died, and on 14 December of the same year she suffered her crowning affliction, the death of her husband, a bereavement which altered the whole tenor of her life. For many years she lived in almost uninterrupted seclusion, and only toward the very end of her reign did she return to anything like the court system of her married life.

The war between Prussia and Denmark caused her keen anxiety, her sympathies on the whole being with Prussia, while the wife of her eldest son was a Danish princess. The death of Palmerston in 1865 raised Lord John (now Earl) Russell to the premiership, and the consequent rearrangement of portfolios made W. E. Gladstone chancellor of the exchequer. The institution of the Albert Medal in 1866 for bravery in rescuing at sea showed at once her devotion to her husband's memory and her quick human sympathy. The war between Prussia and Austria was a severe trial to her, because she had near relatives on both sides, and her satisfaction at the aggrandizement of Prussia was qualified by regret at other results of the war. Earl Russell's defeat on the reform bill led to his resignation in 1866, and a Derby-Disraeli ministry came into power. Disraeli had her active support in carrying his reform bill, which was congenial to her Whig principles. On Derby's resignation in 1868 she raised Disraeli to the head of the government, but his defeat on Gladstone's Irish Church resolution led to a dissolution. The electors gave the Liberals a large majority, and in December 1868, Gladstone became premier and inaugurated a period of reforming energy that filled her with some alarm. With Gladstone she was never in sympathy. Recognizing, however, that Irish disestablishment was inevitable, she used her influence with Archbishop Tait to secure the passage of the bill through the House of Lords. Cardwell's important army reforms were distasteful to her, for she always tried to retain control of the army as a royal prerogative.

The dissolution of 1874 placed the Conservatives under Disraeli in power, much to the satisfaction of the queen; and in 1876 the Royal Titles Bill, conferring upon her the additional title of Empress of India, was passed. The passing of this bill may be taken as marking the formal beginning of the movement known as Imperialism, with which Queen Victoria was from the first in hearty sympathy. Disraeli was rewarded for his services by being raised to the upper House as Earl of Beaconsfield, and the

new régime in India was signaled by the institution in 1877 of the Orders of the Indian Empire and the Crown of India. Gladstone's passionate denunciations of Beaconsfield's Eastern policy and of his aggressive imperialism in other parts of the world during the years 1876-9 were extremely distasteful to the queen, and his return to power after the overwhelming Liberal triumph of 1880 was far from welcome to her. She disapproved strongly of the action of her ministers in regard to the Transvaal in 1881, and during the Egyptian and Sudan troubles of 1882-5, which culminated in the unhappy fate of the brave Gordon, she never ceased to urge strong action upon her advisers. The negotiations which led to the passing of the franchise and redistribution acts of 1884 and 1885 were much aided by her influence and tact. Gladstone was defeated in June 1885, and Salisbury came into office; but in the following January she had to recall Gladstone. She was strongly opposed to the Home Rule policy which Gladstone now adopted, and was greatly relieved by its defeat in the Commons and at the polls, and by the return of Salisbury to power (1886).

The completion of the 50th year of Victoria's reign, in 1887, was celebrated throughout all her dominions with appropriate splendor and rejoicing, and her diamond jubilee in 1897 called forth even more striking demonstrations of loyalty and respect.

The general election of 1892 placed Gladstone again in power, and once more the queen had to face the question of Home Rule, but she was relieved by the rejection of the 1893 bill in the House of Lords. In 1894 Gladstone resigned, and the queen summoned the Earl of Rosebery to the head of the government. The Liberal government fell in 1895, and the queen again asked Salisbury to form a ministry. He remained in power during the rest of her reign. On 23 Sept. 1896 her reign exceeded in length that of George III., till then the longest in English history. When Gladstone died in 1898 she expressed sympathy with his family, but she made no pretense of admiration for his public policy and achievements. The South African War (q.v.), which began in October 1899, caused her much anxiety and pain, and called forth her former enthusiasm for the army and her old sympathy with suffering. She sent boxes of chocolate to the troops at the front at Christmas, 1899, and in recognition of the bravery of Irish soldiers in the field she conceded the permission to wear the shamrock in the army on Saint Patrick's Day, and ordered the formation of a regiment of Irish Guards. She visited Ireland in 1900, after an absence of nearly 40 years.

During the last few years of her life she suffered from rheumatism, failing eyesight, and a tendency to aphasia. On 15 Jan. 1901 she drove out for the last time, and from that day gradually sank till the 22d, when she peacefully passed away at 6:30 p.m. in the presence of all her surviving children except her eldest daughter, who was slowly dying in Germany. Her reign of 63 years, 7 months, and 2 days is the longest in English history, and she outlived all previous British sovereigns, being at her death three days older than George III. Her remains rest in a sarcophagus in Frogmore mausoleum, beside those of her husband. During the later years of her life she spent much of her time

VICTORIA

abroad and at Balmoral and Osborne, and never remained in London for any length of time. Several attempts were made upon her life at various times, but none of them was of any significance or importance. In 1868 she issued 'Leaves from the Journal of our Life in the Highlands,' and in 1883 'More Leaves'—both being very unpretentious little works corresponding with their titles. She also supervised the publication (1868) of 'The Early Years of His Royal Highness, the Prince Consort,' and in 1874-80 supervised another life of her late husband.

To Queen Victoria and Prince Albert were born four sons and five daughters: Victoria Adelaide Maria Louisa, Princess Royal, born 21 Nov. 1840, married 25 Jan. 1858, Frederick, afterward king of Prussia and German Emperor, died 5 Aug. 1901; Albert Edward, now Edward VII., born 9 Nov. 1841, married 10 March 1863, Princess Alexandra Caroline Marie Charlotte Louisa Julia, eldest daughter of King Christian IX. of Denmark; Alice Maud Mary, born 25 April 1843, married 1 July 1862, the Grand Duke of Hesse, died 14 Dec. 1878; Alfred Ernest, Duke of Edinburgh, born 6 Aug. 1844, married 23 Jan. 1874, the Grand Duchess Marie of Russia, became Duke of Saxe-Coburg 22 Aug. 1893, died 30 July 1900; Helena Augusta Victoria, born 25 May 1846, married 5 July 1866, Prince Frederick Christian of Schleswig-Holstein; Louise Caroline Alberta, born 18 March 1848, married 21 March 1871, the Marquis of Lorne, now Duke of Argyll; Arthur William Patrick Albert, duke of Connaught, born 1 May 1850, married 13 March 1879, Princess Louise Margaret Alexandra Victoria Agnes of Prussia; Leopold, Duke of Albany, born 7 April 1853, married 27 April 1882, Princess Helen of Waldeck, died 28 March 1884; Beatrice Mary Victoria Feodore, born 14 April 1857, married 23 July 1885, Prince Henry Maurice of Battenberg. Six of the queen's children survived her, and of the nine all but the Duchess of Argyll have issue. At the time of her death she had 31 grandchildren, and of her great-grandchildren there were 37.

Bibliography.—Biographies and sketches of Queen Victoria in great numbers are accessible everywhere. Among them may be mentioned: Smith, 'Life of Her Majesty Queen Victoria' (1886); Macaulay, 'Life and Reign of Queen Victoria' (1887); Wall, 'Fifty Years of a Good Queen's Reign' (1887); Ward, 'Reign of Queen Victoria' (1887); Wilson, 'Life and Times of Queen Victoria' (1888); Jeaffreson, 'Victoria, Queen and Empress' (1893); Arnold, 'Victoria, Queen and Empress: the Sixty Years' (1897); Tooley, 'Personal Life of Queen Victoria' (1897); Gurney, 'Childhood of Queen Victoria' (1901); Holmes, 'Queen Victoria 1819-1901' (1901); Lee, 'Queen Victoria' (1903). Consult also the queen's own works mentioned above, and the 'Greville Memoirs.'

Victoria, vēk-tō'rē-ā, **Guadalupe** (JUAN FELIX FERNANDEZ), Mexican general and politician: b. Durango 1789; d. Porote 21 March 1843. An ardent patriot he took part in the war for independence and changed his name to Guadalupe Victoria to commemorate a victory over the Spanish forces. He aided in the overthrow of Iturbide in 1823, was a member of the provisional government from March 1823 to October 1824, was the federalist candidate for the

presidency and became the first president of the Mexican republic 10 Oct. 1824. Civil war broke out in 1828, but he retained his office till the expiration of his term, 1 April 1829.

Victoria, vik-tō'rī-ā, in Roman mythology, the goddess of victory, identical with the Greek *Nichē* (see *NIKE*). There was a temple in early times on the Palatine, on the site of which a new one was dedicated during the Samnite wars (294 B.C.). She was represented with wings, crowned with laurel, and holding the branch of a palm tree in her hand.

Victoria, Australia, the southeastern state extending between lat. 34° and 39° S., and lon. 141° and 150° E. It is bounded on the north by New South Wales; on the west by South Australia, the boundary elsewhere being the ocean; Bass Strait on the south separates it from Tasmania; area, 87,884 square miles. The principal towns are Melbourne, Ballarat, Bendigo, and Geelong.

Topography.—The coast both at the eastern and western extremities is low and flat, and with few indentations, but in the centre, between Cape Otway and Wilson Promontory, it is broken by large bays and skirted by perpendicular cliffs 500 to 1,000 feet in height. Among these natural harbors the most remarkable is Port Phillip Bay, which, with an area of 875 square miles, and an entrance scarcely two miles wide, affords a safe shelter for the largest fleet. The entire seaboard, which has a southern aspect, is about 600 geographical miles in extent. The interior, though somewhat diversified by mountains, is chiefly distinguished by vast unwooded plains, so that it has been said the plow might often be drawn continuously for 100 miles across tracts of agricultural land. The land, however, is chiefly occupied as pasture, for which it is best adapted. These are two principal ranges of mountains near the opposite extremities of the state. The eastern range, known as the Australian Alps, enters the state from New South Wales, where it runs south parallel to the coast. On entering Victoria it proceeds southwest, with diminishing height, to the coast at Wilson Promontory. This range has numerous ramifications north and west, covering an area estimated at 7,000 square miles. In Mount Bogong it rises to the height of 6,508 feet, in Mount Hotham to that of 6,100, and there are several other summits over 5,000 feet high. The western range, called the Grampians, lies in a direction roughly north and south, including the Sierra range on the east and the western or Victoria range, with their nucleus in Mount William (3,827 feet), at the northwest extremity of Ripon County. The Grampians and Australian Alps are distinctly connected by such ranges as the Pyrenees and the Great Dividing Range, and their united system forms a continuous watershed, sending the drainage north to the Murray or south to the ocean. The whole system has an extent east to west of about 300 miles, with breadths varying from 100 to 150 miles, and numerous cones and extinct (apparently submarine) craters, and is composed of metamorphic rocks of granite, syenite, quartz, etc., overlain by secondary and tertiary formations. This is the region of the gold-fields. See paragraph *Industries, Commerce, etc.*

Hydrography.—The rivers are numerous, but seldom large. In the rainy season they over-

VICTORIA

flow their banks, and in summer they dry up and leave the country parched. This is the great climatic disadvantage of Victoria. The most important river is the Murray, which, from its source in the eastern mountains, forms the boundary between Victoria and New South Wales, deriving most of its waters from the latter and skirting the whole state in a northwestern direction, finally flowing through South Australia into Lake Alexandrina. Its length is 1,700 miles, and it is navigable for several hundred miles. Another short navigable river is the Yarra-Yarra, on which, at its entrance into Port Phillip Bay, Melbourne, the capital, is situated. Most of the other principal rivers are tributaries of the Murray, except the Snowy, which crosses the east part of the state. Lakes are numerous, but are small and liable to dry up, and often salt.

Climate and Natural Products.—The climate of Victoria is temperate and salubrious, but liable to sudden fluctuations, and the hot winds from the interior which blow at intervals from November to February cause great discomfort. The annual fall of rain at Melbourne is 27 inches. For the chief animal and vegetable products native to the colony see AUSTRALIA. Some of the common English quadrupeds and birds have been introduced, such as hares, rabbits, deer (foreign as well as English), goats, pheasants, quails, white swans, partridges, ducks, thrushes, larks, etc., and are now becoming quite plentiful. Rabbits have become so numerous in some localities as to prove a nuisance. Victoria has a valuable asset in its forests, now under government management.

Agriculture.—Besides wheat, barley, and oats, fruits, and especially the vine, receive attention. Of the four million acres under cultivation, fully two million are under wheat. Victoria promises to become a great wine country. Tobacco is also growing into a staple. Much money has been expended on irrigation and other waterworks. Sheep-farming, however, is the chief agricultural industry, together with horse and cattle breeding.

Industries, Commerce, etc.—The chief mineral production is gold, which was discovered in 1851. The gold discoveries were important not only to the then colony but to the world at large, as they made Australia for a time the chief source of supply. (See GOLD.) In 1852 the yield of gold in Victoria was 2,218,782 ounces, valued at \$44,375,640; in 1856 the yield was 2,985,091 ounces, valued at \$59,710,720. In 1900 the total yield of gold was 807,407 ounces, of the value of \$16,148,140; in 1901 the amount was rather smaller. Copper, tin, antimony, silver, iron, limestone, granite, and coal are also among the minerals worked. The staple product, however, is wool. The cultivation of wool seemed to be threatened by the gold discoveries, but instead of that the value of the wool exported is now much greater than that of the gold obtained. In 1869 the value of the wool exported was \$16,815,375; in recent years it has sometimes been as high as \$30,000,000. The total value of Victorian produce exported in 1868 was \$58,489,465; in 1883, \$66,461,470; in 1900, \$87,112,760. The imports, in 1886 amounted to \$101,052,875; in 1900 to \$91,509,055. A very large proportion of the trade is direct with Great Britain.

Government, Finance, etc.—Victoria is divided into five districts, and these into 37 coun-

ties. The districts are Gippsland, Murray, Wimmera, Loddon, and Western. The executive is vested in the governor, who is also commander-in-chief of the state troops, and is assisted by a ministry of 11 members. He is appointed by the crown for six years, and has a salary of \$35,000. The legislative authority is vested in a parliament of two chambers, the legislative council and the legislative assembly. The legislative council at present consists of 48 members, representing 14 provinces, and holding office for six years. The legislative assembly has 95 members, representing electoral districts, and is elected triennially. Members are paid \$1,500 a year in reimbursement of their expenses. A property qualification is required both for members and electors of the legislative council; the members of the legislative assembly are elected by universal suffrage. The revenue of Victoria amounted in the year 1900-1 to the sum of \$38,635,815; the expenditure for the same year amounted to about \$38,550,000. The chief item of expenditure is railways and public works, and there is a debt, contracted chiefly on account of these, amounting in 1901 to \$250,355,235. In the middle of the year 1901 Victoria had 3,238 miles of railway opened, all belonging to the government of the state. The principal lines connect the leading towns, Melbourne, Geelong, Ballarat, and Bendigo. There is telegraphic communication with the other Australian states and with England. The government of Victoria is protective, and gives bonuses on manufactures, which have consequently made some progress. The breweries, tanneries, soap and candle works, woolen mills, and meat-preserving establishments may especially be mentioned. There are numerous minor manufactures for the supply of local wants. Among religious sects the Church of England is most largely represented in Victoria, the Roman Catholics next, and the Presbyterians third. Attendance at school is compulsory in Victoria between the ages of 6 and 13, the attendance to amount to 40 days in each quarter-year. In the state schools education is free in certain subjects, and compulsory with certain exceptions. There are several colleges connected with various religious denominations, besides the Melbourne University. The number of technical schools is increasing.

History.—Little was known of this part of Australia at the end of the 18th century. In 1802 Port Phillip Bay was explored, and the country and bay were taken possession of for Great Britain, the name being given in honor of Capt. Phillip, governor of New South Wales. A convict settlement was established the following year at Port Phillip, but was transferred to Tasmania (then called Van Diemen's Land) in a few months. Victoria was first colonized in 1834 and 1835 from Tasmania, after one or two other unsuccessful attempts from other quarters. It now made rapid progress, especially in breeding sheep, of which in 10 years it had 1,500,000. The population in 1846 amounted to 32,879. Melbourne had already become a municipality; in 1847 it was made a city, and by 1850 the population numbered over 76,000. But the turning-point in its fortunes was the discovery of gold, which caused a rush of population from all parts. Hitherto it had been known as Port Phillip, and formed part of the colony of New South Wales, but it was now

VICTORIA — VICTORIA FALLS

erected into a separate colony under the name of Victoria. The present system of responsible government was introduced in 1856, and in that year also the first line of railway (Melbourne to Sandridge) was opened. Ballot voting dates from 1856, and in 1857 manhood suffrage became the basis of election for the lower house. A great international exhibition was held in Melbourne in 1880-1, and a second took place in 1888-9. The colony suffered much during the commercial depression of the early nineties of last century, when several banks suspended payment. In recent years financial problems have been prominent, and retrenchment has been a burning issue. The act establishing free, secular, and compulsory education was passed in 1873. An income-tax law came into force in 1895. A very advanced Factories and Shops Act was passed in 1896, and an additional one followed in 1900. These provide for the fixing of minimum rates of wages. In 1901 Victoria became a state of the commonwealth of Australia. It returns six members to the federal senate and 23 members to the federal house of representatives. Pop. (1871) 731,528; (1881) 862,346; (1891) 1,140,405; (1901) 1,201,506. Consult Bannow, 'The Colony of Victoria' (1897); McCoy, 'Victoria and its Metropolis' (1889).

Victoria, vĕk-tō'rĕ-ă, Brazil, a fortified town and seaport, capital of the state of Espírito Santo, situated on the bay of Espírito Santo, 275 miles northeast by east of Rio de Janeiro. The town is regularly built, and has fine streets and some striking buildings. A Jesuit college, founded in 1551, is used as the government palace. Victoria comes next to Santos and Rio as a coffee-exporting port. It is one of the oldest Portuguese establishments in Brazil, and succeeded the town of Espírito Santo, which was founded in 1535 a short distance to the east-southeast, and was soon afterward transferred to a neighboring island. Pop. about 10,000.

Victoria, vĭk-tō'rĭ-a, Canada, a town in Vancouver Island, capital of British Columbia, on the Strait of Juan de Fuca, at the south-east end of the island, amid beautiful scenery. There are government buildings, town-hall, Anglican cathedral, etc., and some good streets and many well-built houses. The harbor of Victoria for large vessels is at Esquimalt (q.v.), three miles distant, where there is a station of the British navy, and to which runs an electric railway. There is also a railway to the coal-mining town Nanaimo (73 miles). Pop. (1901) 20,919.

Victoria, or Kwan-tai-lo, kwän-ti-lō, the capital of the British crown colony of Hong Kong (q.v.), extends for upward of four miles along the southern shore of a beautiful harbor facing the peninsula of Kan-lung on the Chinese mainland. It is dominated by the Peak, a steep hill, on which are many fine residences, and up which there are an inclined plane and steam-tramway. The chief buildings are the government house, city-hall, Roman Catholic and Anglican cathedrals, the large commercial houses and warehouses extending along the quays, public libraries, hospitals, and clubs. A public garden and a race course are maintained; the town is electrically lighted and has also gas works, and a good water supply. The popula-

tion of Hong Kong in 1901 (283,905) was mostly massed in Victoria.

Victoria, vĕk-tō'rĕ-ă, Mexico, the capital of the state of Tamaulipas. See CIUDAD VICTORIA.

Victoria, Philippines, pueblo, province of Tárlac; near the outlet of Canarén Lake; 10 miles northeast of Tarlac. It is at the intersection of three roads. Pop. 10,362.

Victoria, vĭk-tō'rĭ-a, South Africa, a town of southern Rhodesia, the centre of an auriferous district, 188 miles due south of Salisbury. It has the usual government buildings and a hospital, and is protected by a fort. The climate is unhealthy during the rainy season. About 17 miles to the east are the famous Zimbabwe ruins, the relics of a very ancient exploitation of the gold in the territory. (See ZIMBABWE.) Pop. about 25,000 natives and 100 whites.

Victoria, Texas, city, county-seat of Victoria County; on the Guadalupe River, and the Southern Pacific Railroad; about 95 miles southeast of San Antonio and 30 miles from San Antonio Bay, an arm of the Gulf of Mexico. The city is in a fertile agricultural region in which the chief products are cotton and sugar-cane. The chief manufactures are cotton and sugar-cane products, flour, and agricultural implements. There is an extensive trade in grain, fruit, sugar-cane, and cotton. The educational institutions are a public high school, founded in 1899, Nazareth Academy (R. C.), Saint John Baptist School (R. C.), for colored pupils, Saint Joseph's College (R. C.), and public and parish graded schools. There are three banks, one national and two private. The national bank has a capital of \$150,000. Pop. (1890) 3,046; (1900) 4,010.

Victoria and Albert, Royal Order of, a British order instituted for women in 1862, enlarged in 1864, 1865, and 1880. There are about 70 women belonging to the four classes into which the order is divided.

Victoria Cross, a British military decoration instituted in 1856 at the close of the Crimean war. It is granted to soldiers and sailors of any rank for a single act of valor in presence of the enemy. It was instituted in imitation of the French cross of the Legion of Honor. It is a bronze Maltese cross, with a royal crown in the centre, surmounted by a lion, and the words "For Valour" indented on a scroll below the crown. The ribbon is red for the army, and blue for the navy. A pension of \$50 a year accompanies the decoration, when gained by anyone under the rank of commissioned officer, with an additional clasp and \$25 if gained a second time.

Victoria Cross.

Victoria Falls, or Mosi-wa-Tunya (Thundering Smoke), South Africa, a cataract on the Zambesi River in Rhodesia, a few miles below Kazungala at the confluence of the Kuanda.

VICTORIA LAND—VICTORIA NYANZA

A railway from Buluwayo extends to the falls since 1904; a bridge of the Cape to Cairo Railway, with a span of 500 feet, crosses the gorge just below, and affords a magnificent view of the falls; and a hotel has been built for the accommodation of visitors. Plans are in operation to utilize the water-power on the same scale as at Niagara. Immediately above the falls, at an altitude of 2,600 feet above sea-level, the Zambesi is a peacefully flowing stream one mile wide. Divided by three islands separating it into four unequal parts, it suddenly falls, similar to the Passaic at Paterson, N. J., into a transverse chasm or rocky fissure extended straight across the course of the river, and faced at a distance of from 100 to 300 feet by an opposing rocky wall. This fissure is 400 feet deep; the central or main fall has a width of 300 feet; on the west is the Devil's Cataract, and on the east Rainbow and another fall, these last two being almost dry in the hot season. High columns of mist and spray rise like smoke from the fissure, and are seen for a distance of six or seven miles; while the roar of the falls is heard at a distance of 20 miles, hence the native name of "Thundering Smoke." The outlet of the fissure eastward in the opposite wall is only 600 feet wide, and immediately after rushing through this outlet the gorge into which the waters escape, makes a sharp bend known as the "Boiling Pot," owing to its whirlpool turbulence. Thence the river continues a tortuous, zigzag course of about 30 miles through a canyon averaging 600 feet wide, and worn through basaltic cliffs 400 feet high. Livingstone, who discovered the falls in 1855, named them after Queen Victoria. At the brink of the main fall is Livingstone Island, where he camped for some time after their discovery, and the tree still exists on which he cut his initials.

C. L. STUART,

Editorial Staff, 'Encyclopedia Americana.'

Victoria Land, Arctic Regions, the southernmost portion of an insular tract of Franklin Territory, Canada, constituting with Prince Albert Land and Wollaston Land, an island in the Arctic Ocean, with an area estimated at 80,000 square miles. The island is separated from the mainland by Dease Strait, Dolphins Union, and Victoria Strait. Victoria Land was discovered and named by Sir George Simpson, and was explored by Dr. Rae in 1851.

Victoria Land, or **South Victoria Land**, Antarctic Regions, a vast continental plateau southeast of New Zealand, extending from latitude 71° to the South Pole between longitudes 160° to 170° E. Victoria Land was discovered and named by the British navigator Sir James Clark Ross during his voyage of exploration 1841-2, when he sailed along a rocky ice-bound coast for 450 miles, finding in lat. 78° 10' S. a lofty active volcano 12,367 feet high and an inactive cone over 11,000 feet high, which he named respectively Erebus and Terror, after his vessels. The loftiest point of land is Mount Melbourne, which attains a height of over 14,000 feet. Since the expedition of the Belgica (1897-9), and of the British expedition (1898-1900) under the command of the Norwegian, Borchgrevink, Swedish, German, and British expeditions have added considerably to the knowledge concerning the me-

teorological and other conditions of the region. The British Antarctic expedition which sailed on the specially built and equipped steamship Discovery from London, 31 July 1901, returned to Lyttleton, New Zealand, 1 April 1904, in company with the relief steamers Morning and Terranova. The Discovery had been frozen in for 13 months at the foot of Mount Erebus. Scientific work had been maintained throughout the whole period. At Cape Adare Borchgrevink's huts were found in good preservation; a new route to the west was discovered; and a depot was established 2,000 feet up the glacier. In a dash to the South Pole, Capt. Scott, Dr. Wilson, and Lieut. Shackleton reached lat. 82° 17' S., further progress being impeded by the softening of the snow and the death of their dogs. The fact was established that the interior of Victoria Land continued at a height of 9,000 feet, and is evidently a vast ice-covered continental plateau. (See ANTARCTIC REGIONS.) Consult: Borchgrevink, 'First on the Antarctic Continent' (1901); Bull, 'The Cruise of the Antarctic to the South Polar Regions, or the Voyage to Victoria Land, 1894-5' (1896); Cook, 'Through the first Antarctic Night, or the Voyage of the Belgica' (1900).

Victoria Nyanza, nī-ān'za, or **Ukerewe**, oo-kē-rē'wē, Central Africa, the largest of the Nile lakes, and the second in size of the freshwater lakes of the world, extends from 0° 45' N. to 2° 50' S., and from 32° 30' to 35° E., and lies about 3,900 feet above sea-level, between British and German East Africa. Since 1901 a railroad with its terminus opposite Uvuma Island, near the northeast shore, connects the lake through British East Africa with Mombasa on the east coast, and through German East Africa a line is being laid to connect Mwansa on the south shore with Tabora, on the railroad running westward from Dar-es-Salaam on the east coast to Ujiji on Lake Tanganyika. Including the numerous islands with which it is studded, Victoria Nyanza has an area estimated at 27,000 square miles. In the southeast the largest island, Ukerewe, by which name the lake is locally known, is 25 miles long with a maximum breadth of 12 miles, but is uninhabited. In the Sesse archipelago in the northwest are a British government station, and Catholic and Protestant missions. A few steamers and dhows ply on the lake. The lake receives numerous influents, the most important of which is the Kagera, the head-stream of the Nile (q.v.), which enters it on the west. Other tributaries of the lake are the Katonga on the west, the Nzoia on the northeast, the Shimiya on the south, and the Ruwana on the southeast. The lake is supposed to be partly fed by springs. The outlet of the lake, or Somerset Nile, which flows northwest to the Albert Nyanza, whence it issues as the Nile proper, was discovered by Speke on 28 July 1862. While the western shore of the lake is mostly flat, and the northern in many places marshy, the eastern shore presents high mountains. The Victoria Nyanza was discovered by Speke, who caught sight of its southern end near Mwansa on 4 Aug. 1858, and it was afterward, in 1861-2, visited and further explored by its discoverer, along with Grant, and between January and May 1875 it was circumnavigated by Stanley. By the treaty of 1890 between Great Britain

VICTORIA REGIA — VIDAURRI

and Germany the northern portion forms part of British East Africa and the southern portion part of German East Africa, the dividing line being the parallel of 1° S. See UGANDA.

Victoria Regia, a magnificent water-lily, of gigantic size, which is found in South American streams, especially in the tributaries of the Amazon. It was discovered by Haenke in Bolivia in 1801, and, later, was introduced with great difficulty to horticulture. The first flower that bloomed in England was presented to Queen Victoria, in honor of whom the genus was named. The Indians of British Guiana called it the water-platter, in reference to its remarkable floating leaves, which are six feet or more across, and are circular with an up-turned rim several inches high. These gigantic leaves are orbicular peltate and provided with prickly petioles longer than the depth of the water on which they float—an apparent provision against submersion by changes in river level. The leaf-tissues are full of air-spaces and canals, which render the leaves so buoyant that they can support from 100 to 200 pounds of weight; the crimson under-surface is reticulated with many veins, protected by stout, fleshy prickles. The leaf also is punctured with minute holes, possibly for the escape of water from its fenced-in upper surface. The water-lily-like flowers are more than a foot across, nocturnal, and open on two successive evenings. The first time a Victoria opens the inner petals over the stigma remain unexpanded, and the flowers are creamy white, with a delicious fragrance. It closes the next forenoon, to open again at dark, this time expanding to its fullest extent, but has become rose-red in color and with a disagreeable odor. The flower is then closed forever and is withdrawn beneath the surface of the water. The fruits are like peas, hidden in the cells of a dilated torus, or globular prickly capsule about as large as a cocoanut, and the starchy nuts are called "water-corn" in Paraguay, where they are used for food. The Victoria is found in shallow inlets, lakes, and pools in bogs, and has tuberous vertical rhizomes moored by stout, spongy roots. It is easily cultivated in green-houses, or in out-door heated tanks.

Victoria University, England. See OWENS COLLEGE.

Vicuña, vē-koon'yā, **Manuel**, Chilean Roman Catholic prelate: b. Santiago, Chile, 1778; d. Valparaiso, Chile, 1843. He was graduated in theology from the College of San Carlos, was ordained to the priesthood, and engaged in traveling missionary work. He inherited a large fortune which he used in his charitable work, employing a considerable share of it in building a house of retirement. In 1830 he was made a bishop and in that capacity labored earnestly for the re-establishment of the theological seminary. In 1840, when Santiago was made a metropolitan see, he became the first archbishop. He subsequently served as a member of congress of the council of state.

Vicuña, Pedro Felix, Chilean journalist: b. Santiago, Chile, 1806; d. there 1874. He was well educated, and entered journalism at an early age, becoming at 21 one of the founders and editor-in-chief of the Valparaiso 'El Mer-

curio.' He was subsequently connected editorially with 'El Telégrafo' (1827); 'El Elector' (1841); 'El Republicano' (1845) 'La Reforma' (1847); and other leading periodicals, and in 1865 was elected to the national senate, where he introduced the law abolishing imprisonment for debt. He wrote: 'Unico asilo de las Repúblicas Hispano-Americanas' (1837); 'Porvenir del Hombre' (1858); and 'La Hacienda Pública' (1864).

Vicuña-Mackenna, mäk-kā'nā, **Benjamin**, Chilean historian: b. Santiago, Chile, 25 Aug. 1831; d. Santa Rosa del Colmo, Chile, 25 Jan. 1886. He was educated at the University of Chile, and early engaged in researches in national history. For his activity in the revolution of 1851-2 he was imprisoned and condemned to death, but escaped to this country, and then went to Europe. In 1856 he returned, and was admitted to the bar, but political disturbances caused his exile in 1859-63. Upon his return in the last named year he became editor of the Valparaiso 'Mercurio,' in 1864 was elected a deputy, and in 1865-6 was special envoy to Peru and to the United States. He was senator in 1871-6, and in 1875 he was a candidate for the presidency. As *intendente* of Santiago in 1872-4 he greatly improved the appearance of the city, and at his own expense laid out the beautiful pleasure grounds of Santa Lucia. His work as a historian is widely circulated; it is regarded as accurate, and is well written. It includes: 'El Sitio de Chillan en 1813' (1849); 'Revolución del Perú' (1861); 'Historia de la Administración de Montt' (5 vols., 1862-3); 'Historia de Valparaiso' (2 vols., 1868); 'Historia de las Campañas de Arica y Tacna' (1881); 'Al Galope' (1885); etc.

Vicuña, a species of wild llama (*Lama vicunna*) which lives in the most inaccessible and precipitous portions of the Andes near the snow-line from Peru to Bolivia, and is generally seen in small herds. It is described as being very wild and vigilant and is much hunted for the wool and hide. The domesticated alpaca (q.v.) is by some naturalists considered to be an offshoot of the vicuña, though there is much reason to doubt this. Consult: Darwin, 'Voyage of the Beagle' (New York 1889); Cunningham, 'Natural History of the Straits of Magellan' (Edinburgh 1871). See LLAMA.

Vidaurre, vē-thow'rē, **Santiago**, Mexican soldier: b. Nuevo Leon, Mexico, about 1803; d. City of Mexico 8 July 1867. He came of a wealthy family of Indian extraction, was well-educated, admitted to the bar in 1826, and entered political life. He was engaged in several civil wars, rose to the rank of colonel, and in 1852 was elected governor of Nuevo Leon. He assisted in the overthrow of Santa Anna in 1854-5, though refusing to act in conjunction with Alvarez, and was an unsuccessful candidate against the latter for the presidency in 1855. He assumed a species of dictatorship over the states of northern Mexico, forcibly annexed Coahuila, and was long suspected of a design to establish a separate republic. He withheld recognition of Comonfort as successor of Alvarez until 1856, but was then forced to grant it in order to retain his control of the states Nuevo Leon and Coahuila. He at first participated in resistance to the French inter-

VIDIN — VIENNA

vention in 1862-4; later became an officer in the cabinet of Maximilian. He resigned in 1867, but after the fall of the City of Mexico he was captured and shot as a traitor.

Vi'din, Bulgaria. See WIDDIN.

Vidocq, vē-dōk, **Eugène François**, French adventurer and detective: b. Arras, France, 23 July 1775; d. 10 May 1857. He was apprenticed to his father, a baker, at 13, and after constant pilfering robbed the shop of 2,000 francs and fled to Ostend. He soon lost his money and after living a life of vagabondage entered the French army, from which he deserted to the Austrians, but later returned to the French army. His career as a soldier was one of miserable intrigue and disgraceful adventure and he was finally implicated in a forgery for which he was sentenced to eight years imprisonment. He escaped and after further discreditable escapades settled in Paris, where he gained employment on the secret police force. His wide knowledge of the criminal classes enabled him to render efficient service, and in 1812 he was made chief of the *brigade de sûreté*. His activity in the service cleared Paris of great numbers of the criminals with which it was infested, but in 1827 he was removed from office. His subsequent career was one of obscurity and failure, though he apparently endeavored to live an honest life, and he died in wretched poverty. His 'Mémoires' (1828) are not regarded as authentic.

Viele, vē'le, **Egbert Ludovickus**, American soldier: b. Waterford, N. Y., 17 June 1825; d. New York 22 April 1902. He was graduated from West Point in 1847, engaged in the Mexican War in 1847-8, and in the Indian warfare of 1848-52. He resigned from the army in 1853 with rank as lieutenant and in 1854-6 was chief engineer of the State of New Jersey. He was chief engineer of Central Park, New York, in 1856-7, and later of Prospect Park, Brooklyn. At the outbreak of the Civil War he entered the army and was appointed brigadier-general of volunteers. He was second in command of the land forces at Port Royal, and held chief command at Fort Pulaski, Ga., planned and conducted the march to Norfolk, Va., and participated in the capture of that city. He was military governor of Norfolk in 1862-3. He afterward continued the practice of his profession in New York, was appointed park commissioner in 1883, and president of the board of commissioners in 1884. He served in Congress in 1885-7. He wrote: 'Handbook of Active Service' (1861); 'Topographical Atlas of the City of New York' (1865); etc.

Viele, Herman **Knickerbocker**, American novelist, son of E. L. Viele (q.v.): b. New York 31 Jan. 1856. He studied engineering with his father and practised as a civil engineer for some time in Washington, D. C. He has published 'The Inn of the Silver Moon' (1900); 'The Last of the Knickerbockers' (1901); 'Myra of the Pines' (1902).

Vien, vē-ñ, **Joseph Marie**, French painter: b. Montpellier 18 June 1716; d. Paris 27 March 1809. He was a pupil of Natoire, went to Rome 1744 and returned to open a school of painting in Paris (1750). In 1775 he was director of the Academy at Rome but returned to Paris. Napoleon I. made him senator and ennobled him. His chief works are: 'Saints

Germain and Vincent'; 'Dædalus and Icarus'; and 'Cupids at Play' (all in the Louvre). His principal claim to importance lies in the fact that he was the teacher of David.

Vienna, vī-č'n'a (German, WIEN, vēn), Austria-Hungary, the capital of the empire, on the right bank of the Danube and on the Donaukanal, a narrow arm of the river, into which fall several small streams, 380 miles south by southeast of Berlin, and 650 miles east by south of Paris. It stands in a plain with the conspicuous Wiener Wald Mountain boundaries at 10 or 12 miles distance on all sides. Most of the city rises from the right bank of the Donaukanal, on a considerable acclivity. The older portion was separated from the newer by a wall and ditch, forming what is called the "Lines," but this has largely given place to an encircling street or boulevard. The nucleus of the city, the Innere Stadt, forms a small part of the whole inside the Lines. It was formerly surrounded by a rampart, fosse, and glacis, but these were leveled in 1860 and the space occupied by the Ringstrasse, a handsome boulevard averaging 55 yards broad, forming one of the finest thoroughfares in Europe. The inner or old town is still the court and fashionable quarter of the city, and contains some of the finest mansions of the nobility. The streets here are often narrow and crooked; but on the whole Vienna is a handsome well-built town, with fine squares, and straight and spacious streets well kept. The houses are frequently built four or five stories high, and occupied in flats with common stairs. The chief public park is the Prater, on the island between the Donaukanal and the river itself, about four miles long and two broad, beautifully laid out, planted, and decorated, and regarded as the finest public park in Europe.

Among the more important of the numerous fine public buildings are the imperial palace or Hofburg, on the southwest of the inner town, a conglomeration of parts of various dates, with a fine new façade constructed in 1890-3; the imperial summer residence, Schönbrunn, with fine grounds, in the suburb of Hietzing; the palace of the Archduke Albert adjoining the imperial palace, modern and handsome, as are those of the Archdukes Victor and William. The palace of the Prince of Liechtenstein, those of Duke Philip Alexander of Württemberg, Prince Augustus of Saxe-Coburg-Gotha, and others of the nobility are also noticeable. Specially must be mentioned the Parlamentspalast, in which the legislature met for the first time in November, 1883; the magnificent Gothic Rathhaus (1872-83), the courts of justice, the twin museums of art and of natural history, the mint, the imperial and civil arsenals, the barracks, the exchange, and the national bank. The university was founded in 1237, and reorganized by Maria Theresa. It occupies a fine new building, and has over 350 professors and instructors, and an attendance of about 6,000. There is in immediate connection with it an admirable botanic garden and several valuable collections. The Josephinum, an academy for army surgeons, has an extensive series of anatomical preparations in wax. The Polytechnic Institute instructs about 900 pupils in engineering and other practical arts. The Seminarium, a Roman Catholic institute, is devoted to the special training of priests; there are also

VIENNA—VIENNE

Hungarian and Protestant theological institutes. An academy of oriental languages, a military academy, an academy of the fine arts, a conservatory of music, and a number of gymnasia and real schools are among the leading educational appliances of the metropolis. There are many libraries and museums open to the public. The chief among the former are the imperial library with 900,000 volumes and 20,000 MSS., and the university library with 320,000 volumes. The imperial museum of natural history is one of the finest in Europe. The imperial cabinet of coins and antiquities contains 140,000 coins and medals, 12,000 Greek vases, fine cameos and intaglios, and other treasures. The Treasury, among other imperial treasures, contains the regalia of Charlemagne, taken out of his grave at Aix-la-Chapelle. The imperial picture gallery contains about 2,000 pictures. The Academy of Arts has also a gallery, and there are a number of well-known private collections. Charitable, sanatory, and other institutions are numerous. There is a general hospital with 3,000 beds, a general lying-in and foundling hospital, and other benevolent institutions too numerous to mention. The Academy of Sciences, the Austrian Geological Institute, the Imperial Geographical Society, the Polytechnic Institute, the Imperial Agricultural Society, and the Austrian Philharmonic Society are the principal of such associations. Gardens, cafés, and similar places of amusement are numerous. The principal theatres are the Hofburg and the Stadt theatres, the fine Opera House, etc.

Among the churches the most remarkable is the Domkirche, or cathedral of Saint Stephen, a lofty cruciform Gothic structure, with a main tower (erected in 1860-4 to replace a former unstable structure), tapering with regularly re-treating arches and buttresses to a height of 453 feet. The tower contains a bell of 18 tons' weight, made of cannon taken from the Turks. The richly groined roof is supported by 18 massive sculptured pillars, and the interior is adorned with numerous statues and monuments, and a superb pulpit. The windows present fine specimens of ancient painted glass. The Hofpfarrkirche (1330) is a finely-proportioned edifice; the Capuchin Church contains the imperial burying vault; the Votivkirche (1856-79) is one of the finest specimens of modern Gothic.

Vienna is the first manufacturing town in the empire. Its manufactures include cotton and silk goods, leather, porcelain, arms, musical instruments, hardware, and numerous other articles. There is also a large inland trade. It is the centre of a great railway system. The diversion and deepening of the channel of the Danube, which brings the river nearer the city, has largely increased its shipping trade between eastern and western Europe. In 1890 many suburbs were incorporated with the city, which is now divided into 19 districts.

Vienna appears to have been a Roman station in the 1st century. It was afterward included in Upper Pannonia, and received the name of Vindobona. It was taken and pillaged by Attila about 450. It was conquered by Charlemagne about 791, became the capital of the Margraviate of Austria about 1142, a free imperial city in 1237; it was besieged by Solymán in 1529, by Kara Mustapha in 1683, and was occupied by Napoleon, 13 Nov. 1805 and 12 May 1809. Pop. (1890) 1,364,548; (1900) 1,662,269.

Vienna, Concordat of, also known as the **Concordat of Aschaffenburg**, between Pope Nicholas V. and the imperial estates of Germany, in February 1448, by which that eminent pontiff agreed to certain changes in the relations between the papacy and the empire in the spirit of the Concordat of Constance, made in 1418 by Pope Martin V. with the representatives of Germany, France, England, and other countries.

Vienna, Congress of, a congress of powers assembled after the first overthrow of Napoleon to reorganize the political system of Europe, disturbed by the conquests of France. The Congress assembled on 1 Nov. 1814. The principal powers represented in it were Austria, Russia, Prussia, England, and France. Spain, Portugal, Sweden, and other minor powers were also consulted on matters more nearly concerning them. The emperors of Austria and Russia, the king of Prussia, and many other German princes were present in person. The leading territorial adjustments effected by the Congress were the following: Austria recovered Lombardy and Venetia, while Tuscany and Modena were conferred on collateral branches of the imperial house. The Infanta Maria Louisa, queen of Etruria, received the duchy of Lucca in exchange for Parma, Piacenza, and Guastalla, which were given with the title of empress to Maria Louisa, ex-empress of France. The Legations, Benevento, and Ponte Corvo were restored to the pope. The king of Sardinia recovered Piedmont and Savoy, with the addition of Genoa. Murat retained Naples. Holland and Belgium were erected into a kingdom for the Prince of Orange, William I. Hanover, with the title of king, returned to the king of England, and the Ionian Isles were as a republic placed under the protectorate of Great Britain, which also retained Malta, Helgoland, and several conquered colonies. A federative constitution, with a diet at Frankfort, was established for Germany. The kings of Denmark and the Netherlands were admitted in virtue of their German possessions to the diet. Bavaria was reinstated in her Palatine possessions with Würzburg, Aschaffenburg, and Rhenish Bavaria, in return for her restorations to Austria. The demands of Prussia caused a dispute which nearly broke up the congress, but she was finally satisfied with the duchy of Posen, the Rhine Province, and a part of Saxony. The congress was suddenly broken up by the restoration of Napoleon; but its acts were signed by the powers interested on 9 June 1815.

The Congress of Vienna showed a disposition also to interfere in American affairs, and an attempt was made to introduce monarchy in the South American countries then engaged in liberating themselves from the Spanish yoke, by the establishment of a French prince as sovereign over the Argentine provinces. The people of Argentina rejected the proposition. These and other meditated European aggressions, encouraged by the hostile attitude toward republican institutions of most of the powers represented at Vienna, led to the declaration of principle known as the Monroe Doctrine, which for a time put a quietus on monarchical plots against American republics.

Vienne, vē-ĕn, France, an ancient town in the department of Isère; on the Rhone, 19 miles

VIENNA.

1. The Opera House

2. The Bourse.

VIEQUES — VIGILANCE COMMITTEE

south of Lyons. The River Gère passes through the town, and here joins the Rhone, after having supplied motive power to a number of mills and factories. Vienne was the chief town of the Allobroges, is mentioned by Cæsar, and by Martial, who calls it the rich Vienne; in the time of the Roman emperors it was the rival of Lyons. Besides numerous water conduits, etc., of Roman construction, there are a Corinthian temple of Augustus and Livia, remains of a theatre and an obelisk, called The Eagle, 72 feet high; and the museum containing many relics of Roman antiquity. The cathedral of Saint Maurice, partly Romanesque, partly Gothic, was built in 1107-1251; Saint Peter's dates from the 6th century. The town was prominent under the Burgundian princes, and its archbishop disputed with his neighbor of Lyons the primacy of Gaul. In 1312 a council was held here, in which Pope Clement V. pronounced the suppression of the order of the Templars. There are manufactures of woollens, silk, paper, leather, and iron goods, and trade in grain and wine. Pop. (1901) 22,768.

Vieques, vē-ā'kas, or **Crab Island**, West Indies, a dependency of the United States; administratively, a district of the Department of Humacao, Porto Rico; a fertile island with several commodious ports where the largest ships can ride at anchor. It lies about 13 miles east of Porto Rico; is 21 miles long and 6 wide; has a fine climate, and produces almost all varieties of fruit and vegetables that grow in the West Indies. The population of Vieques district (in which Culebra island was included as a ward) was given as 6,642 in the census of 1899; of the town called Vieques, 2,646. The principal settlement is located on a bay on the southeast side; on the north is the town of Isabel Segunda. Statistics of the island prepared under the direction of the War Department of the United States in 1899 show: Native whites, 2,545; foreign whites, 138; negroes, 1,036; mixed, 2,923; married, 688; single, 4,539; living together as husband and wife by mutual consent, 1,185; widowed, 230; inhabitants 10 years of age and over who attended school, 162; 10 years of age and over who could neither read nor write, 3,288; superior education, 22; inhabitants engaged in agriculture or fisheries, 1,396; trade and transportation, 225; manufacturing and mechanical industries, 253; professional service, 39; domestic and personal service, 727; without gainful occupation, 4,002; total number of dwellings, 1,273; number of farms, 120.

Viersen, fēr'sēn, Germany, a town of Rhenish Prussia, in the district of Düsseldorf, 18 miles west of the town of that name, and 10 miles southwest of Crefeld. It has important manufactures of velvet, plush, linen, silk, and cotton fabrics; leather, tobacco, soap, straw hats, etc. Pop. (1900) 24,797.

Vieuxtemps, Henri, ōn-rē vē-ē-tōn, French composer and violinist: b. Verviers, Belgium, 2 Feb. 1820; d. Mustapha, Algiers, 6 June 1881. He was taken on his first concert tour at eight, and afterward studied at Vienna and Paris. He made his first appearance at Paris in 1841 with great success and afterward continued his tours of Europe. He visited the United States in 1844-5, 1856, and 1870, was solo violinist to the emperor of Russia in 1846-52, and in 1870 was appointed to a professorship at the Con-

servatoire at Brussels. A stroke of paralysis, however, in 1873, left his right arm useless and he was compelled to retire. He composed numerous pieces for the violin, comprising concertos, fantasies, and dances.

Vigan, vē'gān, Philippines, pueblo and capital of the province of Ilocos Sur; on the northern delta of the Abra River about three miles from the coast. It is open to the coast trade, is on the west coast road connecting it with Dagupan, and the Dagupan & Manila Railroad, and carries on an important trade with the interior of the province by means of the river. It contains brick kilns, a boat building yard, and a carriage factory. It has broad streets, and a number of important public buildings, including the casa real, court house, provincial administration building, and the council seminary; it has been an episcopal see since 1755, and contains a fine cathedral and the bishop's palace. Pop. (1901) 19,000.

Vigfusson, vig'foos-sōn, **Gudbrand**, Scandinavian scholar: b. Frakkanes, Iceland, 13 March 1827; d. Oxford, England, 31 Jan. 1889. He was educated at Copenhagen University and lived in Copenhagen from 1849 till 1864, devoting himself to the study of old Icelandic literature. His first work, 'Timatal,' on the chronology of the Sagas, was published in 1855. In 1858 he brought out the 'Biskupa Sögur, or Lives of the Icelandic Bishops,' and in 1864 the 'Eyrbyggja Saga.' He then went to England to undertake the Icelandic-English lexicon, on which he was employed from 1864 to 1871. In 1878 the Clarendon Press published his 'Sturlunga Saga,' to which he prefixed the 'Prolegomena,' containing a complete history of the classic literature of Iceland. This was followed by the 'Corpus Poeticum Boreale' (with F. York Powell), a complete collection of the ancient Icelandic poetry, with translation. In 1848 he was appointed lecturer in Icelandic and kindred subjects at the University of Oxford.

Vigil, the day and night preceding a festival in the Roman Catholic Church. In the early period of the Church the night as well as the day was spent in prayer and fasting, but this practice, so far as the night was concerned, was found to promote immorality, and it was given up, the vigil being celebrated in the day time only, except the Midnight Mass, before Christmas, which is a relic of the old custom. The term "vigil" is also applied to the devotional exercises held on the evening preceding a festival.

Vigilance Committee, a term used in the United States to denote a band of citizens organized to summarily punish crime, or prevent the commission of crime, in such instances as the civil and lawfully constituted authorities seem powerless to enforce the law. The most noted committees in the history of the country were those formed in San Francisco, and contiguous territory in the Western States, and in New Orleans, in the Southern States. In the earlier years of San Francisco the city was so overrun with the lawless element among the miners and adventurers that the administration of justice became in the hands of the constituted authorities but a travesty. It was then that the work of the vigilance committee, or Vigilantes, as they were styled, began. That work was short, sharp, and terrible. Thieves

VIGILIUS — VIGNY

and murderers were hanged on every side, while others were forced to seek safety in flight. In New Orleans the last instance of the organization of a vigilance committee was in 1891, when a body of citizens took from the city jail a number of Italians, suspected of being members of the Italian fraternity of murderers, known as the Mafia, and accused of being the murderers of Chief of Police David Hennessey, and put them to death by shooting and hanging. This action produced serious complications between the Italian government and that of the United States.

Vigilius, vī-jīl'ī-ūs, Pope: b. Rome; d. Syracuse 555. During the pontificates of Agapetus I. and Sylvester, Vigilius was *apocrisiarius* (an office nearly corresponding to the later one of papal nuncio) at Constantinople, and having sided with the imperial government against Pope Sylvester, was sent to Rome to procure the imprisonment and exile of Sylvester. This being accomplished, Vigilius was proclaimed pope in 537, but was not acknowledged by the entire Church as such till 540, when Sylvester died. It has been said that, according to a promise given to the empress of Constantinople, he wrote in 538 a secret letter to the heads of the Monophysites, in which he approved of their views, and condemned the anti-Monophysite decisions of Pope Leo I. Modern critics all agree in pronouncing this letter apocryphal; and later (after 540) he refused to issue a decree in favor of the Monophysites, declaring that he would abide by the decisions of the four œcumenical councils and the decrees of Popes Agapetus and Leo. When Justinian in 544 condemned the so-called "Three Chapters" (the writings of Theodore of Mopsuestia, of Theodoret against Cyril, and the Epistle of Ibas), and the western bishops generally threatened resistance to this, Vigilius was summoned to Constantinople (546) and prevailed upon to condemn likewise the "Three Chapters," in a document called 'Judicatum' (548); saving, however, the authority of the council of Chalcedon, which has refrained from condemning them. As this satisfied neither the opponents nor friends of the "Three Chapters," Vigilius called an œcumenical council, the Fifth, to settle the dispute. In the eighth session, the "Three Chapters" were condemned in nearly the same terms used by Pope Vigilius in his 'Judicatum.' As a matter of prudence to allow the agitation occasioned by the controversy to subside, the Pope waited some months before announcing to the Catholic world that the "Three Chapters" had been regularly condemned by the council. Vigilius then obtained the emperor's leave to return to Italy, but died at Syracuse on the way back.

Vignaud, vèn-yô', Jean Henry, American diplomatist and author: b. New Orleans, La., 27 Nov. 1830. He taught in the schools of his native city in 1852-6, and at the same time wrote for 'Le Courrier' and other papers. In 1857-60 he was editor of 'L'Union de Lafourche' at Thibodeaux, La., and in 1860-1 was one of the founders and the editor of 'La Renaissance Louisianaise,' a weekly journal. In 1861 he joined the Confederate army as captain in a Louisiana regiment, and was captured at New Orleans in 1862. The next year he was appointed secretary of the Confederate Diplomatic Commission at Paris; in 1872 he was translator

at the Alabama Claims Commission at Geneva; and in 1873 a delegate from the United States to the International Metric Conference. He was appointed second secretary of the American legation at Paris in 1875, and first secretary in 1882, retaining this position when the legation became an embassy. He has written 'L'Anthropologie' (1861); 'Critical and Bibliographical Notices of All Voyages which Preceded and Prepared the Discovery of the Route to India by Diaz, and to America by Columbus'; 'Toscanelli and Columbus — the Letter and Chart of Toscanelli on the Route to the Indies by way of the West' (1902); 'Toscanelli and Columbus — Letters to Sir Clements R. Markham and C. Raymond Beazley' (1903).

The publication of his 'Toscanelli and Columbus' provoked considerable controversy; its aim was to impugn the purely scientific origin of Columbus' discovery.

Vignola, vèn-yô'lâ (GIACOMO BAROZZI), Italian architect: b. Vignola, near Modena, 1 Oct. 1507; d. Rome 7 July 1573. He received his art training at Rome, later spent two years at the French court; was architect to the pope and after the death of Michelangelo (1504) architect of St. Peter's. The two small cupolas are his additions to that building and the principal other works which he produced are Caprarola Palace near Viterbo and the Church of Jesus at Rome, which was completed after his death by Giacomo della Porta, but not in accordance with the original plans. His buildings are marked by taste and harmony, although chilling in their severity of design. He has had more influence as an architect through his work 'Rules of the Five Orders of Architecture' (1563), which for a long time was considered the standard authority, although on his theory the antique builder was restricted by narrower rules than ever actually were in vogue.

Vigny, vèn-yê, Alfred Victor, COMTE DE, French author: b. Loches, Indre et Loire, 27 March 1797; d. Paris 17 Sept. 1863. He entered the army at the Restoration, but resigned from the service in 1827. By this time he had published two books of verse, 'Poèmes' (1822) and 'Poèmes Antiques et Modernes' (1826), the latter containing the 'Moïse'; and 'Cinq-Mars' (1826), a work of fiction which, despite the author's study of sources, is far from being true to history. This work owes much to Walter Scott. De Vigny made good translations of 'Othello' and the 'Merchant of Venice,' and won a great triumph in 1835 with his drama of 'Chatterton.' At the highest point of his reputation, he did not, however, follow up his success; and he printed nothing further but a few poems in the 'Revue des Deux Mondes.' He was elected to the Academy in 1845. Many critics regard his 'Servitude et Grandeur Militaires' (1835) as his finest work. It is a collection of short stories of the army, and was based to some extent on his own experience. Its tribute to martial heroism was highly appreciated soon after the Napoleonic time. His dramas and prose fiction, particularly 'Cinq-Mars,' are much better known than his verse, though it is chiefly by the latter that literary historians have appraised him. "He is," says Dowden, "the thinker among the poets of his time" in France. His few informing philosophical ideas he treated with great, though un-

equal skill. His general attitude was one of a rather stoic acceptance of things, and his manner has a corresponding dignity. Other volumes by him are 'Les Destinées' (1864), and 'Stello' (1832), the former verse, the latter prose. Consult Paléologue, 'Alfred de Vigny' ('Grands Ecrivains Français' 1891); Dorison, 'Alfred de Vigny, Poète et Philosophe' (1892); Montégut, 'Nos Morts Contemporains,' 1st series (1882); Sainte-Beuve, 'Portraits Littéraires,' Vol. VIII., 'Portraits Contemporains,' Vol. II., and 'Nouveaux Lundis,' Vol. VI.

Vigo, vē'gō, Spain, town in the province of Pontevedra, situated on the Bay of Vigo, 20 miles southwest of Pontevedra. It has some sardine and tunny fisheries. The town is old and irregularly built, but picturesque, and the surrounding country, which is very attractive, is rich in wine, oil, and fruits. Pop. 15,044.

Vihara, vī-hā'ra, a word originally meaning in Sanskrit pleasure or relaxation; afterward signifying a pleasure-ground, and hence a meeting-place. The temples being meeting-places for the Buddhist monks — just as places of worship in New England are called meeting-houses — the word was used to designate a Buddhist temple, and hence it came to be applied to a Buddhist monastery, which in complete form includes the image-house, with images of Buddha, the dagaba, a bell-shaped dome, solid in structure, under which a relic of Buddha is supposed to be buried, the sacred Bo-tree, surrounded by a stone terrace, and supposed to be a descendant of the Bo-tree, or sacred fig-tree, under which enlightenment came to Buddha; also a hall for preaching, a hall of assembly, and sleeping-rooms. See **BUDDHA**; **INDIA**.

Vi'king (from the Icelandic *vík*, a bay or fiord, and the termination *ing*, implying one who belongs to or is descended from: literally one who lurked in bays and issued thence to plunder, a rover belonging to one of the bands of Northmen who scoured the European seas during the eighth, ninth, and tenth centuries. This word has been frequently confounded with *sea-king*, a term which is applied to a man of royal race, who took by right the title of king when he assumed the command of men, although only of a ship's crew; whereas the former term is applicable to any member of the bands. The Scandinavian vikings were excellent ship-builders and expert seamen, and were able to navigate in the open sea by the aid of the sun, moon, and stars. Notwithstanding the origin of the term, which is unpleasantly suggestive of the methods of Malay pirates of present or recent date, it has come to be the recognized designation of the Scandinavian adventurers who, by daring, hardihood, and endurance, fought their way to thrones, and established kingdoms, principalities and dukedoms in all parts of Europe, from southern Russia to Britain. See **NORTHMEN**.

Vilaine, vē-lān, France, a western river which rises in the department of Mayenne, flows west past Vitry to Rennes, where it receives the Ille from the north, and with a southwesterly course reaches the Atlantic at Pénestin, in the department of Morbihan, after a course of 130 miles, 80 of which are navigable. With the Ille it gives its name to the department of Ille-et-Vilaine.

Vilas, vī'lās, **William Freeman**, American lawyer and politician: b. Chelsea, Vt., 9 July 1840. He went to Wisconsin with his parents in 1851, and was graduated from the University of Wisconsin in 1858, and from the Albany Law School in 1860. He was admitted to the New York bar, but returned to Wisconsin, was admitted to the bar there, and had just begun the practice of his profession, when he joined the Federal army (1862). He was promoted lieutenant-colonel, and commanded his regiment during the siege of Vicksburg; he resigned from the army in 1863 and returned to his law practice in Madison. In 1868 he was appointed professor in the Law School of the University of Wisconsin, holding that position till 1885; and in 1897 became a regent of the University. After the Civil War he was an active member of the Democratic party; from 1876 to 1886 he was the Wisconsin member of the Democratic National Committee, and in 1884 was permanent chairman of the National Convention; and in 1885 was elected to the Wisconsin legislature. In the same year he was appointed postmaster-general of the United States, and in 1888-9 was secretary of the interior. His course as postmaster-general was marked by an improvement of the foreign mail service, economy of management, and the negotiation of postal treaties with Mexico and Canada. In 1891 he was elected to the United States Senate for a six years' term. In 1896, being opposed to the free-silver movement, he was one of the organizers of the National or Gold Standard Democratic party, attended their convention at Indianapolis, and was chairman of the committee on resolutions. He edited (with E. E. Bryant) the 1st, 2d, 4th and 6th-20th volumes of the 'Wisconsin Supreme Court Reports.'

Vilayet, vīl-a-yēt', in the Turkish empire, the most important administrative division, governed by a vali, or governor-general, and a council. Each vilayet is divided into *liras* or *sanjaks*.

Villa, vī'lā, a word which in the English and Anglo-American sense means a rural, suburban, or sea-coast dwelling, as distinguished from a farm-house, and which is occupied usually in the summer months by a person who has also a residence in a town or city. In the Latin it had a similar meaning, but also meant originally a small collection of houses, and as the country home of a rich Roman would be likely to have around it a cluster of dwellings of retainers and slaves, it is probable that the country house became known as a villa from this fact. The French and Spaniards have enlarged on the Latin meaning, and with them it is equivalent to the English word "town," either as designating an urban community, or as distinguishing town from country. Italians give about the same meaning to the word as their Roman predecessors.

Villa Adriana, vē'lā ā-drē-ā'nā, or **Hadrian's Villa**, the ruins of a splendid palace, temples, baths, theatres and other buildings erected by the Emperor Hadrian, near Tibur, now Tivoli, about 15 miles east-northeast of Rome. The emperor spared no expense to make it the most beautiful palace in Italy. Many of the statues now in Roman museums were found there.

VILLA ALBANI — VILLARD

Villa Albani, ä'l-bä'nē, a modern Roman villa containing many works of art. It was founded in 1760 by Cardinal Alessandro Albani. The first Napoleon caused many of its art treasures to be removed to Paris. These were restored to the Albani family in 1815, and were sold, and are now in the Glyptothek at Munich, and other collections. Prince Torlonia bought the villa in 1866.

Villa Aldobrandini, ä'l-dō-brän-dē'nē, a noted villa at Frascati, near Rome, built for Cardinal Aldobrandini about the close of the 16th century, and afterward owned by the Borghese family.

Villa Borghese, bōr-gä'sē, just outside the Porta del Popolo, Rome. The founder was Cardinal Scipio Borghese, nephew of Pope Pius V. The original museum was purchased by Napoleon I. and sent to the Louvre, and another has been established in its place. The villa contains many fine sculptures.

Villa Ludovisi, loo-dō-vē'sē, formerly one of the chief attractions of Rome until the palace and gallery of statues, and a large part of the grounds, gave way to the march of local improvement. The villa was built in the early part of the 17th century by Cardinal Ludovisi on the site of the Gardens of Sallust, and large sums were expended in beautifying the grounds and adorning the gallery of statues with a collection of antique sculptures, including the famous Ludovisi Juno and Mars. These were removed in 1891 to the Piombino palace, and the only building remaining of the Villa Ludovisi is the Casino dell' Aurora.

Villa Medici, mā'dē-chē, a famous Roman villa, south of the Pincio, with a fine collection of casts. It was built in 1540 for Cardinal Ricci de Montepulciano, became the property of the Medici family about 1600, and passed into the possession of the Grand Dukes of Tuscany, the younger branch of that family. Here Galileo was confined, when his sentence to imprisonment in a dungeon for advocating great astronomical truths was commuted to detention in the villa of the Grand Duke of Tuscany at Rome. In 1801 it became the home of the French Academy of Art, founded by Louis XIV. It is one of the most interesting features of the Eternal City.

Villa Nazionale. See NAMES.

Villa Pallavicini, päl-lä-vē-chē'nē the celebrated residence of the Marchese Durazzo, at Pegli, on the Gulf of Genoa, Italy. Nature and art are combined to make it one of the most picturesque and enchanting spots on the globe. The decorations display taste and magnificence, and the gardens are luxuriant with the choicest plants of that genial climate, while statues, grottoes, fountains, a Christian chapel, a mosque, a Roman temple, a triumphal arch with sculptures, and other works of art add to the grandeur and beauty of the scene. The villa commands an extensive view of the Mediterranean.

Villafranca di Verona, vël-lä-fräng'kă dē vā-rō'nā, Italy, a small town in the province of Verona, 10 miles south-southwest of Verona. It is of mediæval appearance, surrounded by walls and moats. The castle is now in ruins. The preliminaries of a peace between Francis Joseph of Austria and Napoleon III. of France

were signed here on 11 July 1859. Pop. (1901) 9,461.

Village Communities, supposed upon ample evidence in the present as well as the past, to have been the primitive form of organized human society. In Africa, the South Sea Islands, and among the American aborigines who have progressed beyond savage isolation, the village community exists, a survival of a system which was probably universal in the prehistoric period, and was prevalent throughout a large part of Europe, as it is to-day in Russia, long after Greece and Rome had built flourishing cities, and established new forms of civilization. In the Russian *mir*, a word which signifies union, all the land is held in common, and is divided for use among the several families. Such was the system of land tenure among the ancient German tribes, when they first came within the observation of the Romans, and although at a very early date—probably before the tribes from the North swept down on the Roman dominions—private proprietorship of land had become a fixed institution among them—the village continued to have its common or "green," which every villager had a right to use and enjoy. This communal land system was brought to the New World by the first settlers, being represented by the Boston Common, and the "commons" of New York now known as City Hall Park, and other similar public reserves.

It is unnecessary to trace the village community from its primitive condition through the feudal and more recent periods to the present day. Throughout all changes something of the commercial system survived, and the common enjoyment of land, which had been nearly effaced by private proprietorship, is being revived in the creation and the extension of public parks, open to every citizen. In Russia, on the other hand, the *mir*, or village community, is giving way to private proprietorship, Russia in this, as in some other respects, being in a period of transition from which western Europe evolved centuries ago.

HENRY MANN.

Villagran, vël-yä-grän', or **Villagra**, **Francisco**, Spanish soldier and colonial governor: b. Astorga, Spain, 1507; d. Concepcion, Chile, 15 July 1563. He accompanied Valdivia to Peru, was engaged with him in the conquest of Chile in 1540-5, and in 1547-9 was deputy governor in the absence of Valdivia. Upon the death of Valdivia in the Araucanian uprising of 1553-4 Villagran became governor. While proceeding to march against the Araucanians was severely defeated at Mariguenu in February 1554. He, however, continued the war for months, killing the famous Indian chief Lantaro at Mataquito in 1556. He was superseded by Garcia Hurtado de Mendoza in 1557; and that governor, in order to be rid of his dangerous rival, sent Villagran a prisoner to Peru. On his release he went to Spain, secured a royal commission to succeed Mendoza and returned in 1561 to take charge of the colony. He pushed the Spanish conquests beyond the Andes, and though much harassed by the uprisings of the Araucanians, continued in office until his death.

Villain, or **Villein**. See VILLEINS.

Villard, vil-ärd', **Henry**, American journalist and capitalist: b. Speyer, Bavaria, 11 April

VILLARI — VILLEINS

1835; d. Dobbs Ferry, N. Y., 11 Nov 1900. His real name was Hilgard, but he changed it to Villard on coming to the United States in 1853. He entered upon journalistic work, writing at first for German-American journals, then as correspondent for the Cincinnati *Commercial*, and for the Chicago *Tribune*. He reported the Lincoln-Douglas debate of 1858 for eastern newspapers; was at the National Republican Convention of 1860; and during the Civil War won a wide reputation as a war correspondent; going to the front with the Army of the Potomac; he also conducted a correspondents' bureau at Washington. In 1866 he went abroad to report the Austro-Prussian war for the New York *Tribune*. In 1868-71 he was secretary of the Social Science Association in Boston. In 1873 he represented German bondholders in financial dealings with some of the railroads of the Pacific coast; going to the Northwest he organized the Oregon Railway and Transportation Company; and in 1881 by a pooling of railway interests formed the Northern Pacific Railroad Company, and was elected its president. The road was completed in 1883, but was involved in financial difficulties, on account of which Villard lost a large part of his fortune, and resigned the presidency of the road. He regained his financial standing with the aid of German capital, and in 1889 became one of the directors of the Northern Pacific, holding that position until 1893, when the road went into the hands of receivers. He was also interested in Edison's inventions; in 1890 he bought the Edison Lamp Company at Newark, and later the Edison Machine Works at Schenectady, where he organized the Edison General Electric Company, of which he was president two years. In 1881 he obtained a controlling interest in the New York *Evening Post*, and the *'Nation.'*

Villari, vèl-là'rè, Pasquale, Italian historian: b. Naples 3 Oct. 1827. After the failure of the Neapolitan revolution (1848-9), in which he had taken part, he was compelled to escape to Florence, where he wrote his *'Storia di Girolamo Savonarola e de' suoi Tempi'* (1859-61), which soon gained for him a European reputation. In 1859 he was appointed professor of history in the University of Pisa, and in 1866 received a similar chair in the Institute di Studj Superiori of Florence. Besides having frequently served in the Italian parliament as deputy, he was general secretary of public education in 1869, was made senator in 1884, and in 1891 was minister of public education. Among his many works are *'Leggende che Illustrano la Divina Commedia'* (1865); *'Loggi Critici'* (1868); *'Niccolò Machiavelli e i suoi Tempi,'* a work of great value (1877-82), *'Arte, Storia, e Filosofia'* (1884), *'I Primi Due Secoli dell Storia di Firenze'* (1893-4). He is recognized as a historical investigator of wide research and excellent scholarship. Several of his works have been translated into English by his wife, Linda White Villari.

Villars, vè-lär, Claude Louis Hector, Duc DE, French soldier: b. Moulins, France, 8 May 1653; d. Turin, Italy, 17 June 1734. He entered the army in 1672, served under Turenne, Luxembourg, and Créqui; was appointed lieutenant-general in 1693, and in 1699-1701 he was ambassador to Vienna. During the war of the

Spanish Succession he received in 1702 his first independent command, defeated Prince Louis of Baden at Friedlingen 14 October, and was created marshal. He joined the Elector of Bavaria in 1703, gained a signal victory at Höchstädt in that year. In 1709 he succeeded Vendôme as commander of the army in the Netherlands, and in order to save Mons he engaged Marlborough and Eugene at Malplaquet, 12 Sept. 1709. He was defeated and badly wounded, but was victorious over the allies at Denain, 24 July 1712. In March 1714, he concluded the peace of Rastatt. On the outbreak of the war with Austria he again took the field with rank of grand-marshal of France, and conducted a successful campaign with his wonted energy, although he was then 81. He resigned his command because of the unwillingness of the king of Sardinia to co-operate with his plans, but died before his recall came. His *'Mémoires'* (1884-92) are not regarded as authentic. Consult the biographies by Seguy (1735), Anquetil (1784), and Baheau (1892).

Villehardouin, Geoffroi de, zhō-frwà dé vèl-är-doo-än, French chronicler: b. Villehardouin, near Troyes, France, about 1160; d. before 1213. He was one of the earliest of French historians, and of his life little is known save what is gathered from his *'Histoire de la Conquête de Constantinople.'* He seems to have taken an important part in the Fourth Crusade; took the cross in 1199; was one of the commissioners to arrange with the Venetians for the transportation of the crusaders; fought at the siege of Constantinople, and gained high repute as a diplomat. He became marshal of Rome after the establishment of the Latin empire and was granted the fief of Messina in 1207. From this time all trace of him is lost. His *'Histoire'* is a clear and collected relation of the events of the Crusade from 1198-1207, and is valuable both from the historical and literary standpoint. The first printed edition was that of 1585; later ones include: Du Cange (1657); Dom Brail (1823); N. de Wailly (1872; 3d ed. 1882). Consult Sainte-Beuve's *'Causeries du Lundi,'* Vol. IX.

Villeins, a species of serfs who grew up along with the feudal customs of Europe. A feudal lord received from his superior, on condition of military service, a grant of conquered land, which he distributed among his dependents on two distinct tenures or classes of tenure. The freemen, who were the kindred or followers of the conqueror, received their land on the same condition of military service as himself. The conquered or the serfs who were not directly employed in domestic or personal service were allowed to cultivate the land on the tenure of menial or non-military services, either determinate or indeterminate. Such is the simple origin of villenage. In some cases the villeins were at the absolute disposal of their lord, who could sell them or deal with them as he pleased. In others they were attached to the soil, and formed part of its movable wealth. Sometimes they held by defined services, such as making and repairing roads, felling timber, or cultivating the lord's domain; but even then the control of justice was commonly in the hands of their lord, against whose oppression they had no redress. Hallam says that in England they were incapable of property; yet even in England, when the

VILLEMALIN — VILLISCA

laws began to extend their protection to personal rights, the association of the villeins with the soil established a good tenure of property, subject to customary services, which were finally commuted into money rents. Villenage appears to have died out in England, without special legislation to abolish it. The system of agricultural labor under yearly contract, with violation of contract on the part of the laborer punishable by imprisonment, which continued in England down to the latter part of the 19th century, partook essentially of villenage, as the laborers had either to face prosecution as vagrants, or renew each year the obligation of servitude, which might fairly be called involuntary.

Villenage—if the involuntary servitude of white persons not convicted of crime comes within that term—has never existed in the United States, except in the form of indentured apprenticeship, which in colonial days was practically serfdom, and of the form of servitude known as "redemption," when immigrants were sold and bound out for a term of years to pay the expenses of their passage. "Redemption" servitude existed long after the United States became independent, and many respectable and even prominent families are descended from "redemptioners."

The peons of Mexico and New Mexico were villeins attached to the soil. Peonage was abolished in the United States 2 March 1867. See PEONS AND PEONAGE; SERFS; SLAVERY; UNITED STATES — SLAVERY IN.

Villemain, vîl-mân, **Abel François**, French author: b. Paris 11 June 1790; d. there 8 May 1870. He was educated at the Lycée Louis-le-Grand, and in 1810 became assistant professor of rhetoric at the Lycée Charlemagne. He was subsequently professor at the École Normale and also occupied the chair of eloquence at the Sorbonne. He was elected to the Academy in 1821, and in 1827 was selected with Lacretelle and Chateaubriand to draft its protest against the revival of the censorship. In 1827 he was a deputy, became a peer of France in 1832, was minister of public instruction in 1838-44, and in the last-named year resigned because of ill health. After the establishment of the empire he retired from politics. He was three times awarded the prize of the Academy; in 1812 for his 'Euloge de Montaigne'; in 1814 for 'Avantages et Inconvénients de la Critique'; and for his 'Euloge de Montesquieu' in 1816. As a critic his keen wit, quick appreciation, and brilliant command of rhetoric made him a power in French letters. His works include: 'Histoire de Cromwell' (2 vols., 1819); 'Discours et mélanges littéraires' (1823); 'Cours de littérature française' (5 vols., 1828-9); 'Souvenirs contemporains d'histoire et de littérature' (1856); 'Histoire de Grégoire VII' (1873), etc.

Villemessant, Jean Hippolyte Cartier, zhôn ċ-pō-lêt kâr-tê-ā vîl-mê-sân, French journalist: b. Rouen 22 April 1812; d. Monte Carlo, France, 11 April 1879. He went to Paris in 1839, entered journalism, and for a time wrote the fashion department of the Girardin 'Presse,' using the signature 'Louise de Saint Loup.' In 1854 he re-established 'Le Figaro' as a semi-weekly, making it a daily after 1865. Consult his 'Mémoires d'un journaliste' (1867).

Vill'enage. See VILLEINS.

Villiers, vil'yêr, **Charles Pelham**, English statesman: b. London 3 Jan. 1802; d. 16 Jan. 1868. He was graduated from Saint John's College, Cambridge, in 1824, was called to the bar of Lincoln's Inn in 1827, appointed secretary to the master of the rolls in 1830, the examiner of witnesses at the court of chancery in 1833. He was returned to Parliament for Wolverhampton in 1835 and until his death remained the representative of that constituency. From the first he strongly advocated the repeal of the corn-laws, and he was a supporter of free-trade before Cobden and Bright entered Parliament and while Gladstone still favored the corn-laws. After the formation of the Anti-Corn-Law League Villiers became the leader of the movement in Parliament and continued to press the agitation. The accession of Bright and Cobden to the ranks of Parliamentary free-traders further strengthened the cause, and Villiers saw his purpose achieved when in 1846 Peel joined their ranks. In 1859 he became a member of the Palmerston cabinet and also president of the poor-law board, which posts he resigned in 1866. During the American Civil War he ably seconded Palmerston in his support of the Northern States, and in later years was a determined advocate of the union of Ireland and Great Britain. He introduced in Parliament the Union Chargeability Bill and secured its passage in 1865, supported the penny-postage act, and throughout his entire career never deviated from the principles of reform to which he had pledged himself on his election in 1835. A selection from his speeches was published in 'Free-Trade Speeches of Hon. Charles Pelham Villiers, M. P.' (2 vols. 1883).

Villiers, Frederic, English artist and war correspondent: b. London 23 April 1852. He was educated in France and studied at South Kensington and the Royal Academy. He was war artist for 'The Graphic' in Servia in 1876 and accompanied the Russian army in Turkey in 1877-8. He was a witness of the bombardment of Alexandria in 1882, was subsequently in Abyssinia, Bulgaria, Servia, and Burma, and in 1887 made a lecture tour in this country. As special artist for the New York *Herald* and other journals he accompanied the Japanese army in 1894, represented the London *Standard* in 1897 during the Græco-Turkish War, and in 1898 accompanied Kitchener in the Sudan. During the Boer war in 1899 he was in South Africa as correspondent for the 'Illustrated London News.'

Villiers, George, Duke of Buckingham. See BUCKINGHAM, DUKE OF.

Villisca, vil-'is'ka, Iowa, city in Montgomery County; at the confluence of the East and West branches of the Nodaway River, and on the Chicago, Burlington & Quincy Railroad; 16 miles east of Red Oak, and 15 miles north of Clarinda. The city is in a rich agricultural region; in the vicinity are deposits of fire-clay and soap stone. The chief manufactures are clay products, which include brick and tile, and flour and dairy products. There are large shipments of fruit, wheat, corn, hay, vegetables, butter, eggs, poultry, and live-stock. There are two banks, a national and a private, having a combined capital of \$100,000, and deposits amounting to \$534,910. Pop. (1890) 1,744; (1900) 2,211.

VILLON — VINCENNES

Villon, vèl-lôn, François, French poet: b. Paris 1431; d. about 1484. His real name was François de Montcorbier, but he adopted the name of his guardian, Guillaume de Villon, a priest. He received the degree of master of arts in 1452, and three years later fled the country because he had killed a priest. He was pardoned in 1456 when it had become clear that the deed was done in self-defense, but immediately afterward he engaged in a series of extensive robberies, for which he was condemned to death. While lying in prison awaiting the execution of his sentence he wrote the epitaph in which he depicts himself and his companions suspended on the gibbet. His sentence was, however, commuted to banishment, but in 1461 he was again in prison, this time at Meung, perhaps for sacrilege. He was set free in October of that year in consequence of a jail delivery ordered by Louis XI, on the occasion of his visit to the town. Nothing is known of his subsequent career. His works include 'Le Petit Testament' (1456); 'Le Grand Testament' (about 1461); and numerous ballads. The first dated edition of his works is that of 1489, and of recent editions the best are those of Moland (1879) and Longnon (1892). There is an English translation of much of his best work by John Payne (new ed. 1892). Andrew Lang, Swinburne, and others have also made renderings. Consult: Longnon, 'Etude Biographique' (1878); R. L. Stevenson, 'Familiar Studies' (1888); Schwob, 'Le jargon des coquillards en 1455' (1890); Paris, 'François Villon' (1901).

Vil'na, or Wilna, Russia, (1) Capital of the government of the same name, on the Vilja, 415 miles southwest of Saint Petersburg. It is picturesquely situated, partly on hills, partly on the banks of the river, and contains numerous convents and churches. The most notable buildings are the governor's palace, the town-house, and the buildings of the now suppressed university. The Greek and the Roman Catholic cathedrals are also worthy of notice. Educational institutions are numerous. The manufactures include tobacco, lead pencils, hats, leather, etc., and there is an extensive trade in grain and timber. Vilna dates from the 10th century. Pop. (1897) 154,532. (2) The government, which lies on the Baltic, has an area of 16,421 square miles and a population (1897) 1,591,912.

Vinalhaven, vi'nal-hä'ven, Maine, town in Knox County; about 13 miles east of Rockland, the county-seat. The town is made of several small islands in Penobscot Bay. The granite quarries are a source of income to the town. The place is a favorite summer resort. Pop. (1880) 2,855; (1890) 2,617; (1900) 2,358.

Vincennes, vān-sēn, Jean Baptiste Bissot, SIEUR DE, Canadian explorer: b. Quebec, Canada, January 1688; d. Illinois 1736. He came from a wealthy family of Quebec, was a relative of the explorer Louis Joliet, and from early youth was engaged in western expeditions. He became an ensign in the Canadian army in 1801 and was detailed to service in the West, where he became a favorite with the Miami Indians. In 1804 he rescued some Iroquois prisoners from the Ottawas; saved Detroit from an invasion by the Foxes in 1812; and afterward resided successively in Miami, Ohio, and Michigan. He founded the city of Vincennes, Ind., where he

built a fort and a trading-post, and in 1836 he joined the expedition against the Chickasaw Indians. The expedition was conducted by d'Artaguet and was at first successful, but a series of victories were followed by defeat owing to the desertion of the Miamis. Vincennes was captured and, together with the commander and others of the expedition, was burned at the stake.

Vincennes, France, a town in the department of the Seine, a southeastern suburb of Paris, just outside the walls and close to the Bois-de-Vincennes. Its large old castle, which is surrounded by lofty walls and deep ditches, was once the frequent residence of the French kings, and was long a state prison. It now forms part of the defenses of Paris. The donjon or keep is a square tower 170 feet high with walls 10 feet thick. The Bois-de-Vincennes (q.v.) is a beautiful and extensive public park which contains an exercise-ground for infantry, and an area set apart for artillery purposes. Pop. (1901) 30,336.

Vincennes, vin-sēnz', Ind., city, county-seat of Knox County; on the Wabash River, and on the Pennsylvania, the Evansville & T. H., the Baltimore & O. S., and the Cleveland, C. C & St. L. R.R.'s; about 105 miles southwest of Indianapolis. It is in a fertile agricultural region, a rich prairie section, on a gradual slope to the river. The government census of 1900 gives the number of manufacturing establishments 109; the capital invested, \$1,552,386; the average amount paid annually for raw material, \$1,098,676; and the value of the annual products, \$2,282,384. The chief manufactures are flour, lumber products, sewer-pipe, brick, tile, wrapping paper, iron and tin products, agricultural implements, cement, plaster, and foundry and machine shop products. The city is laid out in squares, with streets nearly all 50 feet wide. Harrison Park, the plaza at the city-hall, and the Court-House Square are the chief park-lands owned by the city. The principal public buildings are the county court-house (\$400,000), the city-hall (\$100,000), the government building, the old hall where the legislature met, the house occupied by William Henry Harrison when he was governor of the Territory, the church once used as the Roman Catholic Cathedral, the Vincennes Sanatorium, and Saint Vincent's Orphanage, for boys. The educational institutions are two high schools, one for white pupils and one for colored (1882), Vincennes University, founded in 1806, Saint Rose Academy (R. C.), public and parish graded schools, a public library, and three school libraries. There are three national banks and one state bank, having a combined capital of \$375,000. The national banks have deposits amounting to \$3,331,470. The government is administered under the charter of 1867 which provides for a mayor, who holds office two years, and a city council.

Population.—In 1890 Vincennes had a population of 8,853, and in 1900, 10,249.

History.—In the vicinity of Vincennes are many Indian mounds. The first missionaries and explorers, who entered this part of Indiana by way of the river, found, where is now the city, an Indian village called Chip-kaw-kay. Vincennes is the oldest place in the State. In 1702,

VINCENNES UNIVERSITY

the French built here a fort, and for several years, it was the seat of the empire of France in the Ohio Valley. French from Canada settled here, and the place was called "The Post," for over 30 years, when the name was changed to Vincennes, in honor of François Morgan de Vin-enne, who had been one of the officers of the fort. In 1763 the British obtained possession of the place, but owing to disturbed conditions in the East, General Gage gave the fort but little attention, so Vincennes had only a self-government until 1777, when on 19 May, Lieutenant-Governor Abbot of Detroit, arrived and took possession. He called the place Fort Sackville. The British incited the Indians to attacks on the whites who were under French rule or who were in rebellion against Great Britain. George Rogers Clark, of Kentucky, desiring to protect his country from those disastrous attacks, conceived the plan of capturing Detroit, Vincennes, and Kaskaskia, and submitted his plan to Patrick Henry, then governor of Virginia. After much argument on the part of Clark and hesitancy on the part of Henry, the governor authorized Clark to recruit 350 Virginians for the expedition, and gave him money and ammunition. Clark proceeded with the undertaking, and 4 July 1778 captured Kaskaskia. With the aid of Father Gibault, of Kaskaskia, Clark secured the good will of the French people of Vincennes. In 1779 Clark's Virginians took possession of Fort Sackville. It was some time before the British in Detroit heard of the changes in the Ohio Valley. Then a force of 500 regulars and Indians under the British commander, Henry Hamilton, embarked for Vincennes. Captain Helm, in charge of the place, did not learn of the approach of the British until they were within three miles of the fort. His garrison consisted of himself, a few inhabitants, and one American soldier. The inhabitants went to their homes and Helm planted his two cannons; he took charge of one, and the remainder of his force stood by the other. When Hamilton demanded a surrender, Helm said no man could enter the fort until the terms of surrender were made known. Hamilton promised them the honors of war and then Helm and his force of one man surrendered. Clark did not hear of the fate of Helm for some time. Francis Vigo (after whom the county is named), a merchant of Saint Louis, and a patriotic American, offered to go to Vincennes to attend to furnishing the garrison with supplies in accordance with Helm's request, sent to Clark before the arrival of the British. When Vigo approached Vincennes he was more than surprised to learn that the place was in possession of the British, who at once arrested him. He demanded release on the ground that he was from Saint Louis, but Hamilton retained him until it was discovered that the French inhabitants would cut off the source of supplies for the soldiers unless Vigo were released. Vigo was finally given his freedom, on condition that "on his way to Saint Louis he would do no hostile act to the British interest." This he promised, and at once took a canoe, descended the Wabash to the Ohio, then to the Mississippi, and arrived at Saint Louis without breaking his pledge. As the boat touched the shore, Vigo sprang on land, then back into the boat, and started for Kaskaskia, to inform Clark about Vincennes. Clark saw at

once that unless something were done, the whole Ohio Valley would be lost to America. Desperate measures were resorted to, for transporting a small force of poorly clothed men was difficult at any time, but almost impossible in winter. On 5 Feb. 1779 he sent 64 men by boats, carrying provisions and ammunition, and with 170 men they began a march of 200 miles. There were no tents, no towns or even settlements where they were sure of finding friends. All the inhabitants of Kaskaskia accompanied them the first few miles of the journey; then soldiers and citizens knelt and the parish priest gave them his blessing, and Clark and his men marched on to Vincennes, leaving the people on their knees praying for the success of the American Nation. On the 23d of February Clark and his men arrived at the heights back of Vincennes, and sending word to the French inhabitants that they were there, the hungry soldiers were soon supplied with provisions. That night the Americans marched into the town and at once began an attack on the fort. The next morning Hamilton surrendered, and the American flag was placed on the fort, and then and there the name was changed from Fort Sackville to Fort Patrick Henry. The place was held by Virginia until 1783, when it was ceded to the United States. In 1787 the first court was held in the place, and in 1800 the Indiana Territory was established and Vincennes was made the capital. In 1813 the territorial capital was removed to Corydon. A university and a library had been established. The first church in the Northwest Territory was built in Vincennes, in 1742, by Father Meurin, from France. The first school in Indiana was established here by Father Rivet.

Vincennes brought to the United States the great Middle West and made the Louisiana Purchase a possibility. Had it not been for the bravery, intelligence, and patriotism of George Rogers Clark and his Virginians, and the devoted French of the Ohio Valley, the western limit of the United States would have been, for many years at least, the Alleghany Mountains. But Vincennes has done more for the preservation and extension of the Union; here Aaron Burr received his first and most decided check when he sought to break up the Union. The first provision made by any government for the care of the insane was made by the Indiana Constitution, and to Benjamin Parke of Vincennes is due the credit of inserting the clause regarding the matter. Not only may Vincennes, "on the banks of the Wabash," be called "The Key to the Northwest," but also a historic city that was the scene of many heroic deeds. Consult: Law, 'The Colonial History of Vincennes'; Smith in Powell's 'Historic Towns of the Western States.'

Vincennes University, located at Vincennes, Ind. It owes its establishment to a grant of land made by Congress in 1804 in the Vincennes land district for the use of a seminary of learning. In 1806 Vincennes University was incorporated and designated as the recipient of the land granted by Congress. In 1830 and subsequently the legislature assumed the right to sell and rent the lands and appropriate the receipts for State purposes. The resources of the university were thus so crippled that it

VINCENT — VINCENT DE PAUL

was forced to suspend work for a time; but in 1843 the trustees carried the matter into the courts, and finally by appeal to the Supreme Court of the United States, obtained judgment in favor of the university. The State of Indiana has not yet fully paid the claims of the university, though a bill providing for payment was introduced in 1899, and a similar bill in 1901, and a commission was appointed in 1903 to report on the subject of payment in 1905. The university includes the following departments: (1) The School of Literature and Science; (2) the Normal School; (3) the School of Music; (4) the School of Business. The School of Literature and Science consists of two departments, the College and the Academy, and offers a classical and a scientific course extending over five years, the first three years academic, the last two collegiate. No degrees are conferred. The work of the two years' collegiate course includes elective studies. The Normal School offers a teachers' elementary course of one year and a teachers' advanced course of two years. The School of Business is open during all the year and also holds night sessions; a business course, and a shorthand course are provided. One State scholarship for each legislative district is provided. The library in 1904 contained over 6,000 volumes; the students numbered 232, of whom 76 were in the School of Literature and Science.

Vincent, vin'sent, Boyd, American Protestant Episcopal bishop: b. Erie, Pa., 18 May 1845. He was graduated from Yale in 1867 and from the Berkeley Divinity School, Middletown, Conn., in 1871. He took orders in the ministry in the last named year, was assistant at Saint Paul's, Erie, 1871-2, rector of Cross and Crown Church, Erie, 1872-4, and rector of Calvary Church, Pittsburg, 1874-89. In 1889 he was consecrated bishop coadjutor of southern Ohio.

Vincent, Charles Edward Howard, English soldier and member of Parliament: b. Slinfold, Sussex, 31 May 1849. Educated at Westminster School and the Military College at Sandhurst, he served in the army 1868-73, was called to the bar of the Inner Temple in 1876 and was military commissioner of the London *Daily Telegraph* at the opening of the Russo-Turkish war in 1877. In 1878 he reorganized the metropolitan detective system, and has sat in Parliament as a Conservative member for Sheffield since 1885. He has published 'Russia's Advance Eastward' (1872); 'Military Geography' (1873); 'Law of Criticism and Libel' (1877); 'Law of Extradition' (1880); 'Howard Vincent Map of British Empire' (10th ed. 1902); 'Police Code and Manual of Criminal Law' (11th ed. 1901); etc.

Vincent, Frank, American traveler: b. Brooklyn, N. Y., 2 April 1848. He was educated at Yale and for many years devoted himself to a systematic tour of the world. In 1884 he gave to the New York Metropolitan Museum of Art an extensive collection of Indo-Chinese antiquities and art. His published works include 'The Land of the White Elephant' (1874); 'Through and Through the Tropics' (1876); 'Norsk, Lapp, and Finn' (1881); 'Around and About South America' (1890); 'In and Out of Central America' (1891); 'Actual Africa' (1895); etc.

Vincent, John Heyl, American Methodist bishop: b. Tuscaloosa, Ala., 23 Feb. 1832. He was educated at the Wesleyan Institute, Newark, N. J., engaged in preaching at 18, and in 1857 was ordained elder. In 1857-65 he was pastor at Galena, Ill., and at Chicago. He founded the 'Sunday-School Quarterly' in 1865, and the 'Sunday-School Teacher' in 1866, embodying in them the Sunday School lesson-system since widely adopted. In 1874 he established, in conjunction with Louis Miller, the Chautauqua Assembly, of which he was chancellor 1878-1900. He was elected bishop in 1888, residing at Topeka, Kan., until 1900, when he became resident bishop in charge of the European work of the Methodist Episcopal Church. In addition to various text-books published for the use of the Chautauqua Society, he has written: 'Little Footprints in Bible Lands' (1861); 'The Modern Sunday-School' (1887); 'Unto Him' (1899); etc.

Vincent, Leon Henry, American author and lecturer: b. Chicago 1 Jan. 1859. He was graduated from Syracuse University, and since 1885 has given his time mainly to lecturing upon English and American literature. He has published 'The Bibliotaph and Other People' (1898); 'Hotel de Rambouillet and the Précieuses' (1900); 'The French Academy' (1901); 'Corneille' (1901); 'Molière' (1902).

Vincent, Marvin Richardson, American Presbyterian clergyman: b. Poughkeepsie, N. Y., 11 Sept. 1834. He was graduated at Columbia in 1854; was classical instructor in the Columbia grammar school 1854-8, and professor of languages in the Methodist University of Troy, N. Y., 1858-60. In the year last named he entered the Methodist ministry, but three years later became a Presbyterian and was successively pastor of the First Presbyterian Church of Troy 1863-73, and of the Church of the Covenant, New York, 1873-88. Since 1888 he has been professor of New Testament criticism at Union Theological Seminary, New York. With C. T. Lewis, he translated Bengel's 'Gnomon of the New Testament' (1860-2). He is the author of 'Amusement a Force in Christian Training' (1867); 'The Two Prodigals' (1876); 'Gates into the Psalm Country,' a series of descriptions (1878); 'Stranger and Guest' (1879); 'Faith and Character' (1880); 'The Minister's Handbook' (1882); 'Christ as a Teacher' (1886); 'Word Studies in the New Testament' (1887-1900); 'That Monster, the Higher Critic' (1894); 'The Age of Hildebrand' (1896); 'A History of the Textual Criticism of the New Testament' (1899); etc.

Vincent de Paul, Fr. vãn-sôn dè pôi, Saint, founder of the Priests of the Mission: b. Pouay 1576; d. Paris 27 Sept. 1660. Some of his early years were spent on the slopes of the Pyrenees tending his father's scanty flock; but as the boy exhibited signs of remarkable promise, he was sent to be educated first at Dax, and then at Toulouse. There he completed his ecclesiastical studies, and was ordained priest in 1600. In 1605, while on a voyage from Marseilles to Narbonne, he was captured by Turkish pirates, and sent to Tunis, where he was in slavery for two years under three different masters, the last of whom, a renegade from Nice, he re-converted to Christianity, and induced to escape with him

VINCENTIAN FRIARS — VINCI

to France. They reached Aigues-Mortes in a little skiff, 28 June 1607. The next year Vincent spent in Rome, where he secured the friendship of Cardinal d'Ossat, who sent him to Paris on a secret mission to Henry IV., and who afterward procured his nomination to the Abbey of Saint Leonard de Chaume, in the diocese of Rochelle. In 1616 he began the course of labors as a missionary, and the next year he laid the foundation of the congregation of Priests of the Mission, an association of priests who devote themselves to the task of assisting the parish clergy. The associates received royal letters patent in 1627, were erected into a congregation by Pope Urban VIII. in 1632, and in the following year established themselves in the Priory of Saint Lazare in Paris, whence the name of Lazarists, by which they are sometimes called. The reformation of the hospitals, the establishment of the first foundling hospital in France, the institution of the Sisterhood of Charity, the instruction of idiots at his Priory of Saint Lazare, and continual labors among the convicts sent to the galleys are the next events to be recorded in his history. During the famine which depopulated Lorraine (1638-9) he collected and distributed 2,000,000 livres among the sufferers. He attended Louis XIII. in his last illness, and was appointed by the queen-regent one of the four members of the Conseil de Conscience, to whom was committed the charge of distributing ecclesiastical preferments. During the wars of the Fronde the Priory of Saint Lazare was sacked by the mob, Vincent being wrongfully supposed to have favored Mazarin. Among the last acts of his life was the foundation of an asylum for aged working people of both sexes, and a hospital for all the poor of Paris, opened in 1657. His preaching was more remarkable for its simple impressiveness than a show of learning. During his lifetime he published only the 'Regulæ seu Constitutiones communes Congregationis Missionis,' and in 1826 appeared 'Conférences spirituelles pour l'explication des Règles des Sœurs de la Charité.' He left behind him a voluminous correspondence on spiritual subjects, chiefly addressed to the Priests of the Mission and other friends.

He was canonized by Clement XII. in 1737, and his festival is celebrated on 19 July. Consult: Chantelauze, 'Vie de Saint Vincent de Paul' (1882); and lives by Jones (1873); Loth (1880); Maynard (1886); Morel (1891); Bougaud (1889); Adderley (1901).

Vincen'tian Friars. See LAZARISTS.

Vincetox'icum, a genus of American vines, belonging to the milk-weed family. They have usually cordate leaves, and rather large, white or purple-tinted, 5-merous flowers with a cup-shaped crown, in axillary umbel-like fascicles. The United States species are found chiefly in the South. *V. shortii* has the odor of the strawberry shrub. *Cynanthus acuminatum*, with star-shaped, creamy flowers, called mosquito-catcher, because it secretes a viscid substance, on which insects become fixed, was formerly placed in this genus. Vincetoxicum is the official name of the swallow-wort (q.v.).

Vinci, Leonardo da, lă-ō-năr'dō dă vîn'chê, Italian painter, sculptor, architect, civil and military engineer, and scientist: b. Vinci, a village

near Empoli in the valley of the Arno 1452; d. Chateau de Cloux, near Amboise, France, 2 May 1519. He was brought up in his father's house and early placed with Andrea del Verrocchio, an artist of considerable power and skill, whose chief work is the equestrian statue of Bartolommeo Colleoni at Venice, and young Leonardo rapidly attained to technical maturity. Vasari ascribes to Leonardo a figure in Verrocchio's picture of 'The Baptism of Christ' now in the Academy at Florence, and probably other parts of this painting were also from the young artist's brush. In 1472 we find his name on the list of the painters' guild at Florence, but he appears to have been regarded as Verrocchio's pupil till about 1477. He received his first independent commission from the signory of Florence in 1478, and he worked there under Lorenzo the Magnificent till 1480. Only two authentic works of this early period of his career are extant, namely, 'The Adoration of the Kings,' in the Uffizi Gallery at Florence, and the 'Saint Jerome,' in the Vatican Gallery at Rome, both unfinished. During the period 1480-4 he held the appointment of engineer to the sultan of Babylon, and traveled widely in Egypt, Cyprus, Asia Minor, Armenia, and neighboring regions. About 1485 he settled in Milan in the service of Ludovico Sforza. A letter is extant in which Leonardo states his qualifications to the duke, undertaking to carry out not only works of military and civil engineering, but also works in architecture, painting, and sculpture. He was fully employed in Milan in many different ways. He constructed irrigation works, invented many new types of military engines, and even took part in campaigns, acted as director of court pageants and festivities, and completed his two greatest works of art. Of these latter, the celebrated colossal equestrian statue in bronze of Francesco Sforza is known only by the studies for it preserved in the Royal Library at Windsor. The other masterpiece of Leonardo is the celebrated picture of the 'Last Supper,' which ranks with Michelangelo's 'Last Judgment' and Raphael's 'Sistine Madonna' as one of the three greatest pictures of the world. It was painted on the wall of the refectory in the monastery of Santa Maria della Grazie, and was completed about 1498 after some 10 years' work. Leonardo employed a method, devised by himself, of painting on the wall in oil, but unfortunately the picture soon began to fade. It has been repeatedly restored, and thus it is probable that in its present form, though preserving the well-balanced and carefully-conceived design of the painter, it retains nothing of his actual execution. In engravings, notably that of Raphael Morghen, and numerous copies, it is perhaps the best known of all pictures. It portrays the varied emotions and expressions of the 12 just after Jesus has told them that one of them will betray him. At Milan, Leonardo was head of an academy of arts, and trained or influenced numerous painters, such as Bernardino Luini, Beltraffio, and his close friend Salaino. He also extended his investigations in mathematics, mechanics, and other sciences, and contributed the figures to the 'De Divina Proportione' of his mathematical friend Pacioli. Duke Ludovico gave him a present of a vineyard near Milan in 1499, but on his patron's fall next year he left Milan and appears to have gone to

VINE-PESTS — VINEGAR

Venice. In 1502 he entered the service of Cæsar Borgia as military engineer, and traveled with him through much of central Italy. He settled once more in Florence in 1503 and produced fresh paintings of great power. A black chalk cartoon for an altar-piece for Santa Maria dell' Annunziata is one of the treasures of the Royal Academy in London. His portrait of 'Mona Lisa,' wife of Zanobi del Giocondo, purchased by Francis I., and now in the Louvre Gallery (being commonly called La Gioconda), is a masterpiece. He and Michelangelo were both commissioned in 1503 to decorate the walls of the great hall of the palace of the signory, now Palazzo Vecchio, at Florence. Each prepared a cartoon of a battle-subject, that of Da Vinci representing a furious fight for a standard in the battle of Anghiari, in which the Florentines overcame the Milanese. Both the cartoons, when exhibited, were admired as triumphs of the painter's art, but they have unfortunately both perished. Leonardo started to transfer his subject to the walls, but a new process invented by himself failed even more signally than that used at Milan, and he abandoned the work in disgust. From extant engravings we can form some conception of this great attempt. His failure with this picture and disputes with his half-brothers about his inheritance led to his departure in 1506 for Milan, then in French possession. He became court painter and engineer to Louis XII., and about this time painted his 'Virgin of the Rocks,' of which there are two existing forms, one in the Louvre and the other and much better one in the National Gallery at London. In 1514 he went to Rome, where the pope was Leo X., son of his former patron Lorenzo de' Medici, but he was not well received at the papal court, and in 1515 he returned to Milan, where Francis I. was now in authority. Francis induced him to go to France, and assigned for his use the Château de Cloux, near Amboise, where accordingly Leonardo and his 'Virgin of the Rocks,' of which there are in 1516.

Leonardo was the oldest of the three great masters of the Italian Renaissance—Da Vinci, Michelangelo, Raphael—and the most brilliant and many-sided representative of a brilliant and many-sided age. The extent of his existing work is small, but the extraordinary greatness of his genius is as indisputable as the marvelous range of his powers. Standing in the front rank of painting and sculpture in his time, he was also one of its foremost engineers, and his works show that his mind was as thoroughly scientific as it was grandly artistic. He anticipated many of the ideas and principles slowly evolved by science since his day, and he had a wonderful acquaintance with the facts of anatomy, physiology, botany, geology, and other similar branches of knowledge. In painting, his greatness is chiefly shown in his mastery of chiaroscuro and his accurate drawing. He was a close student of nature and almost wholly free from the trammels of the antique. Besides the works already named, the Louvre contains 'La Belle Ferronnière,' which is probably by him, and there are a great many of his drawings in various collections. His 'Treatise on Painting' is his best known literary work, and is included, with translation, in Richter's 'Literary Works of Leonardo da Vinci' (1883). It is

worth mention that Leonardo was left-handed and wrote from right to left, using a sort of phonetic spelling. Consult: Uzielli, 'Ricerche intorno a L. da Vinci' (1872 and 1884); Heaton, 'L. da Vinci and his Works' (1874); Grothe, 'L. da Vinci als Ingenieur und Philosoph' (1874); Richter, 'L. da Vinci' (1880); and Rosenberg, 'L. da Vinci' (1898).

Vine-pests. See GRAPE INSECT-PESTS.

Vinegar is dilute acetic acid obtained by the acetous fermentation or oxidation of alcoholic liquids—wine, beer, malt infusion, beet-root juice, dilute spirits—or also by the dry distillation of wood. Its color, varying from a pale yellow to a deep red, and its odor and taste are influenced to a large extent by the materials employed in its manufacture. Vinegar obtained by acetous fermentation possesses different properties from the pure acetic acid obtained from wood because the former contains besides acetic acid and water—the essential constituents of vinegar—also small quantities of bodies, which being analogous to those occurring in wine may properly be termed bouquet bodies. These substances give the vinegar an agreeable odor and taste entirely lacking in vinegar prepared from acetic acid obtained from wood. Even if an agreeable odor is obtained in the latter by the addition of certain volatile oils and compound ethers, the harmonious bouquet peculiar to vinegar obtained by acetous fermentation is never realized, the relation being homologous to that existing between artificial and genuine wine. Any one gifted with a sensitive and practised sense of smell can at once distinguish pure acetic acid vinegar from wine, malt or fruit vinegar.

Vinegar obtained by the acetification of wine has been known from the very earliest times, being used in this form contemporaneously with wine. Many noted scientists, such as Stahl, Davy, Berzelius, Naegeli, Liebig, and Pasteur studied the process of acetous fermentation, and in 1822 Doebereiner suggested that acetification is due to the action of oxygen on alcohol, which is converted into acetic acid and water; Liebig improved upon this theory and maintained that by the exposure, under suitable conditions, of alcohol to the action of oxygen one third of the entire hydrogen contained is withdrawn and aldehyde formed, which latter however immediately combines further with oxygen and is converted into acetic acid; the formation of vinegar from alcohol therefore being a partial process of combustion. Acetification is however a far more complicated process than Liebig supposed and later investigations have shown it to be a chemico-physiological process with the co-operation of a living organism. The presence of alcohol and oxygen alone will not suffice for acetification, the presence of nitrogenous bodies and salts, besides that of an organism which obtains its nourishment from the nitrogenous bodies and the salts are absolutely necessary. Pasteur was the first to consider the formation of vinegar from alcohol as a peculiar process of fermentation, maintaining that a certain organism which he termed *Mycoderma aceti*, the "vinegar ferment" or "vinegar yeast," consumes the alcohol, the nitrogenous substances and the salts; on the other hand Naegeli asserts that this organism rather decomposes the particles of the sub-

VINEGAR

stance to be fermented into simpler compounds. This organism, of which there are many different kinds, among which the best known are the *Bacterium aceti*, *Bacterium Pasteurianum*, the *Bacterium Kuctzingianum*, the *Bacterium oxydans*, and the *Bacterium industrium*, consists of a single globular or filiform cell, its special characteristic being its manner of reproduction, which is effected by a division of the cell into two and then a separation or splitting of both. The cells form chains, which at 104° F. (40° C.) readily grow into long threads (involution form). It is interesting to note that this organism not only oxidizes alcohol into acetic acid, but will also oxidize the latter into carbonic acid and water, in case alcohol is lacking. This is an important factor in storing vinegar, as if it is allowed to come in contact with air the strength of the vinegar is lessened, owing to the consumption of acetic acid by the ferment.

Vinegar may be made according to the old or slow and the new or quick process. The principle embodied in the old process is to allow wine, which is unfit for consumption as such, beer, malt-infusion, etc., to oxidize and to draw off the vinegar formed. We may say that this slow process is an adaptation of the spontaneous souring of beer, wine or fermented liquors in general under such conditions which tend toward an improvement of the product. While this process is especially employed for the preparation of wine vinegar it can nevertheless be used just as well for making malt or fruit vinegars. In this process oak vats are thoroughly cleansed with boiling water and saturated with hot vinegar, whereupon the vats are filled two thirds with the mixture of alcohol and vinegar. It is essential that the liquid contain no more than 14 per cent of alcohol, as the vinegar ferment perishes in the presence of more alcohol; a content of a few per cent of vinegar, while not absolutely necessary is nevertheless beneficial as it hastens the acetification. This alcoholic liquid is technically termed the "wash." The temperature is maintained as nearly as possible at 86-90° F. (30-32° C.) and in a few days the acetous fermentation will have begun, which is then allowed to continue until completed, which requires according to the temperature maintained from 2 to 10 weeks. The vinegar is then drawn off and stored in a cool place in barrels which are filled to the bung hole and closed air-tight, in order to prevent the vinegar ferment from oxidizing the acetic acid and thus weaken the vinegar. Another way is to draw off the vinegar every week as it is formed and to add as much fresh "wash" as vinegar is drawn off. The process is practically continuous and need only be interrupted after several years, when the accumulation of tartar and sediment renders a cleansing absolutely necessary.

The process may however be interrupted and disturbed by the development of the vinegar eel, an animalcule consisting of a comparatively long cylindrical body coming to a sharp point. The vinegar eel necessitates air for its life and strives with the vinegar ferment, which forms a cover on the surface of the wash, and failing in its endeavor, dies. The dead eels sink to the bottom and are apt to cause putrefaction, which compels a thorough cleansing of the vats. The supply of air is regulated through the

bung hole an aperture cut in the upper third of the vats. Wine vinegar made according to this process obtains its peculiar bouquet from the wine employed and contains besides all the substances of the wine either unchanged or only partly transformed, some new ones, as acetic ether and other compound ethers. In a similar manner malt and fruit vinegar may be made. The former contains the extractive substances of the malt, as, for example, dextrin, nitrogenous bodies, phosphates, etc., and the latter contains also malic acid. Every pure vinegar which contains only a little acetic ether is made from a mixture of dilute spirits, some vinegar and a malt-infusion.

Schuetzenbach, perceiving that if the relative surfaces of contact of the alcoholic liquid with air be greatly enlarged the formation of vinegar would be accelerated, in 1823 invented what is termed the "new" or "quick process." Almost at the same time in England Ham, and Wagman in Germany brought out similar propositions. By spreading the liquid over as much space as possible and allowing it to percolate slowly through and diffuse over a mass of shavings, mostly of beechwood (or similar material) a thin layer, presenting a large surface, is formed, which consequently is better adapted for the chemical appropriation of the oxygen in the current of air caused to pass through the shavings, which not only serve to divide the liquid but also to carry the vinegar ferment thus hastening acetification.

In this process the generator, which is technically termed a "graduator," consists of a large vessel divided into three superimposed compartments of which the uppermost serves to divide the alcoholic liquid into many fine drops; in the middle compartment, which is the largest, acetification takes place, and the lower one is a reservoir for the vinegar formed. This apparatus is built in various forms but the most practical is that of a truncated cone, as the alcoholic liquid in its descent can spread over a constantly increasing area, and continually comes in contact with fresh air, entering from below: Fir or other durable wood, except oak, which besides being too expensive, also contains too many extractive substances, is used. All metallic parts (hoops, etc.) must be well varnished, as heavy rusting will otherwise be caused by the vapors of the acetic acid. Various sizes have been tried, but a generator which is about 10 feet high, and 3 and 4 feet in upper and lower diameter respectively, has been found the best. A well-fitting cover in which holes are bored in concentric circles closes the top. The current of air is regulated by opening or closing some of these holes, as may be necessary. The alcoholic liquid is generally introduced through a rotatable sparger. A thermometer is of course a necessary adjunct.

Dr. Bersch of Vienna recently invented the automatic plate generator which is so arranged that a formation of aldehyde and the destruction of acetic acid already formed is impossible and that the evaporation of alcohol is almost eliminated. By means of thin plates of beechwood he is enabled to have the alcoholic liquid and the air in undisturbed continual contact, so that vinegar is formed all the time. His generator has the shape of a prism 8 feet high, having a base 3 feet square, the interior is fitted

VINEGAR BIBLE—VINELAND

with 10 layers of very thin beechwood arranged in such a way that the liquid can descend on both sides of the plates, while the air ascends between them undisturbed. Once acetification is induced it can be maintained for years, providing of course the influx of the alcoholic liquid and the admission of air are properly regulated.

Theoretically 100 grams of alcohol will produce 130 grams of acetic acid and will require 300 grams of oxygen to oxidize the alcohol, but in actual practice the yield is less, the losses being in general due to evaporation of alcohol, caused either by imperfect apparatus, or by too rapid oxidation. In general such losses average 15 to 20 per cent, although they sometimes amount to 30 per cent. While it is true that rapid oxidation will produce vinegar quickly, yet it is also true that in such rapid oxidation too much of the alcohol evaporates and is not oxidized, so that what is gained in time is lost in material, which is the more expensive of the two. The fact that air which has passed a generator still contains three fourths of its oxygen shows that four times the calculated amount of air is necessary in order to fully convert the alcohol into acetic acid. Inasmuch as the formation of vinegar is a process of combustion, it is self understood that heat is developed. This fact must always be borne in mind by the vinegar manufacturer, because the vitality of the vinegar ferment depends upon the temperatures to which it is exposed. Its activity is greatest between 68 and 95° F. (20 to 35° C.); if this limit is passed the formation of vinegar decreases rapidly, while at 104° F. (40° C.) it ceases altogether, and 122° F. (50° C.) the ferment perishes. Lower temperatures do not affect the ferment as much as higher temperatures do, but a change from one to the other is not beneficial for the development of the ferment.

Another method of preparing vinegar is by properly diluting purified pyroligneous acid, which is obtained by the dry distillation of wood. The foliaceous trees, especially the beech, or the oak and birch, which latter having been deprived of their bark are better adapted than the conifers, as the pine. The dry distillation of wood is accomplished in iron airtight retorts, of which there are very many styles, and in accordance with the temperatures employed varying products, which are partly gaseous and partly liquid, are formed. The gases are consumed and the liquid component separates into two layers of which one is aqueous and dark brown, containing the wood vinegar, while the other is oily, almost black, containing wood tar. During distillation the first distillates, which contain very little wood vinegar, pass over at 175-235° F. (79-113° C.) while at 288° F. (142° C.) the lighter oils pass. As soon as the water shows a sufficient content of wood vinegar the temperature is raised to 315° F. (157° C.). Above that temperature the heavier oils are received. The quantities received vary, as has been said, according to the employed temperature and in general about 35 per cent of wood vinegar, (Pyroligneous acid), 20 per cent of wood tar and 33 per cent of charcoal are received.

Pyroligneous acid as it is received from the still is a reddish brown fluid having a most disagreeable sour, smoky empyreumatic odor and

taste. It is a very complex product, containing besides acetic acid, all the homologues of acetic acid from formic to caproic acid; methyl alcohol, acetone, metacetone, aldehyde, etc., etc.

Commercial acetic acid is chiefly prepared from pyroligneous acid purified by distillation and rectification, because the acetic acid obtained by the oxidation of alcohol is only of a limited concentration and is chiefly used for table use, and for preserving food articles. The crude pyroligneous acid is chiefly used for preserving meats and sausages, for the preservation of wood and ropes, for embalming, and in veterinary surgery for many diseases. Through fractional distillation the rectified pyroligneous acid, which is almost colorless and of a burnt, sour odor and taste is obtained, which is mostly worked up into acetic acid, methyl alcohol is obtained as a by product. Wood vinegar is used to a large extent for the manufacture of various acetates, esters, etc., and in a proper dilution is also used as vinegar for household and preserving purposes, which practice is, however, not advisable, as such vinegar is injurious to health on account of the numerous secondary ingredients contained in the pyroligneous acid. Highly concentrated acetic acid, under the name of vinegar essence has found considerable application in photography and surgery.

In the household certain precautionary measures are to be followed in the use of vinegar. Vinegar, or foods prepared in vinegar should never be allowed to stand long in copper, brass or tin vessels, even the enamel of iron and the glazing on earthenware vessels sometimes contain lead, which forms lead acetate in connection with the vinegar. Glass or porcelain vessels are best adapted for this purpose.

ALFRED FISCHER,

Of the Industrial Chemical Institute of Milwaukee.

Vinegar Bible, a Bible printed in 1717 at the Clarendon Press, in Oxford. So named because in the running headline of Luke xxii. vineyard was misprinted vinegar.

Vinegar Hill, Ireland, an elevation 389 feet high, close to the town of Enniscorthy, in County Wexford, scene of the defeat of the Irish by General Lake, 21 June 1798. The Irish had camped here for about a month, and discredited their cause by outrages on the lives and property of the loyalists in the surrounding country. About 400 of the Irish were cut down, the remainder fled to Wexford, whither Lake marched the day after, killing all whom he found with arms.

Vine'land, N. J., borough in Cumberland County; on the Pennsylvania and the Central of N. J. R.R.'s; about 32 miles southeast of Philadelphia. It was founded in 1861 by Charles K. Landis. It is in a region noted for its fruit products. The chief manufacturing establishments are shoe factory, sash, door and blind factories, pearl button works, glass works, in which are made flint and plate glass, and a paper box factory. The grape juice manufactured here is widely known. Other manufactures are thermometers, chenille curtains, rugs, and men's clothing. In 1900 (Federal census) there were 58 manufacturing establishments in Vineland. The average annual value of the manufactured products was \$1,450,072. There

VINES — VINLAND

are three banks, one National and two State banks. The three have deposits amounting to \$756,770. The educational institutions are the State Training School for Feeble-Minded Children, a high school, graded schools, the Vineland Free Public Library, containing nearly 7,000 volumes; and the library of the Historical and Antiquarian Society, containing about 6,000 volumes. There are here also the State Home for Disabled Soldiers and the State Institution for Feeble Minded Women. The city owns and operates the electric light plant and the water-works. Pop (1890) 3,822; (1900) 4,370.

Vines, Richard, English colonist in America: b. near Bideford, Devonshire, 1585; d. Barbados 19 April 1651. Educated in medicine, he was sent out in 1609 to explore Maine, then became agent to Sir Ferdinando Gorges (q.v.), and, having returned to New England, passed a winter, probably that of 1616-17, at Winter Harbor, near the Saco. Some doubt is said to be cast on the authenticity of his signature to a deed containing a patent to himself and a certain John Oldham for lands now occupied by Biddeford, Me., and executed in 1629, by the fact that in that year he was in England. Until 1635 he was principal superintendent of Saco, and then he was made councillor. In 1643 he again became administrator of the government of the colony. Some trouble arose in 1644 between him and George Cleaves, who had been sent out by Alexander Rigby to take possession of and administer a territory covered by what was known as the Lygonia or Plough patent and conflicting with the grant made to Gorges. Cleaves sent a messenger to Saco suggesting that the matter be left to the arbitration of the Massachusetts magistrates. Vines refused, and went to Boston to represent his case. The controversy, however, came to nothing at the time. Vines returned to England in 1645, and went thence to Barbados, where he became a planter and also practised his profession.

Vines, Richard, English Puritan divine: b. Blaston, Leicestershire, about 1600; d. London 4 Feb. 1656. Educated at Magdalene College, Cambridge, he was instituted to the rectory of Weddington, Warwickshire, 11 March 1628, and in 1630 to that of Caldecote also. He gained considerable fame as a preacher, and his first sermon before the Commons (30 Nov. 1642) increased it. In 1643 he was placed in the rectory of Saint Clement Dane's, and in 1644 made master of Pembroke Hall, Cambridge. He resigned Saint Clement Dane's on presentation to the rectory of Watton, Hertfordshire. At the Westminster Assembly, he was a member of the committee for drafting a confession of faith (1645). In 1649 he refused allegiance to a government without a king or house of lords, and was thereupon removed from Pembroke and the rectory of Watton. From 1650 he was minister of Saint Lawrence Jewry, London. He was styled the "English Luther," was greatly learned, and favored a modified episcopacy. He published some individual sermons, and others were posthumously collected in such volumes as, 'Παράκλησις, Obedience to Magistrates' (1656), and 'A Treatise on the Institution of the Lord's Supper' (1657).

Vinet, vĕ-nā, Alexandre-Rodolphe, Swiss theologian: b. Orchy, near Lausanne, 17 June 1797; d. Clarens, Switzerland, 4 May 1847. He

studied for the Protestant ministry in which he was ordained in 1819, having previously been appointed, when only 20, professor of French language and literature at the gymnasium of Basel. In 1829 he published his 'Chrestomathie Française,' comprising a valuable survey of French literature. Subsequently he was a prolific contributor to the journal 'Le Semeur,' and in 1837 published a selection of essays written for it under the title 'Essais de Philosophie Morale.' In the year last mentioned he accepted the chair of practical theology in the Academy at Lausanne, but gave it up in 1845, and seceded from the national church, holding the principle that there should be no connection between church and state. His views on this subject were enforced in his 'Essai sur la Manifestation des Convictions religieuses, et sur la Separation de l'Eglise et de l'Etat' (1842). As a preacher Vinet was noted for eloquence and earnestness, qualities which also form the distinguishing characteristics of his writings. In addition to those already referred to, may be mentioned his 'Discours sur quelques sujets religieux,' and 'Nouveaux Discours,' selections from both of which have been published in English, under the title of 'Vital Christianity'; 'Études Évangéliques' and 'Nouvelles Études Évangéliques,' translated into English as 'Gospel Studies.' His 'Histoire de la Littérature Française au XVIII. Siècle,' and 'Études sur la Littérature Française du XIX. Siècle' display considerable critical insight.

Vineyard (vin'yard) Sound, a passage separating Martha's Vineyard (q.v.) from the Elizabeth Islands (q.v.). It is about 22 miles long and from three to six miles wide. There is one lighthouse where Vineyard Sound opens into Nantucket Sound, and one about midway and off the coast of Elizabeth Islands.

Vingt-et-un, vānt-ā-ūn, a card game played with whole pack and with any number of players. The cards count according to the number of pips (or spots), the face cards counting 10, and the ace 1 or 11 as the holder chooses. The object of the game is to obtain a hand the total value of which equals 21 (hence the name). Two cards are dealt to each player, and if no one has a hand equal to 21, on the first deal, the players have the right of drawing cards in turn; if the cards drawn bring the total to more than 21 the player is out of the game. The player first obtaining a hand of 21 takes the pool, or any other winning determined upon.

Vin'land, or Wineland, the chief settlement of the early Norsemen in North America, represented in modern times by part of Massachusetts and Rhode Island. The first voyager to see the north coast was Bjarne Herjulfson, who was driven thither by a storm in the summer of 986 A.D., when making a voyage from Iceland to Greenland, of which country his father, Herjulf, and Eric the Red, were the earliest colonists. But Bjarne did not touch the land, which was first visited by Leif the Lucky, a son of Eric the Red, about 1000 A.D. One part of the country he named Helluland "Stoneland"; another Markland "Woodland," the modern Newfoundland and Nova Scotia. A German in his company having found the grape (most probably the *Vitis vulpina*) growing wild, as in his native country, Leif called the region Vinland. The

VINTON—VIOLET

natives from their dwarfish size they called skraelings. Two years after Leif's brother, Thorwald, arrived, and in the summer of 1003 led an expedition along the coast of New England south, but was killed the year following in an encounter with the natives. The most famous of the Norse explorers, however, was Thorfinn Karlsefne, an Icelander, who had married Gudrid, widow of Thorstein, a son of Eric the Red, and who in 1007 sailed from Greenland to Vinland with a crew of 160 men, where he remained for three years, and then returned, after which no further attempts at colonization were made. Rafn, in his 'Antiquitates Americanæ,' published the first full collection of the evidence which proves the pre-Columbian colonization of America. Both he and Finn Magnusen labor to show that Columbus derived his first hints of a new world from the accounts of these old Icelandic expeditions. Finn Magnusen is believed to have established the fact that Columbus did visit Iceland in 1477, 15 years before he undertook his expedition across the Atlantic, and so may have heard something of the long-abandoned Vinland. Consult: De Costa, 'Pre-Columbian Discovery of America' (1901); Rafn, 'Antiquitates Americanæ' (1837); Reeves, 'Finding of Wineland the Good' (1890).

Vinton, Alexander Hamilton, American Protestant Episcopal bishop: b. Brooklyn, N. Y., 30 March 1852. He was graduated from Saint Stephen's College, Annandale, N. Y., in 1873, and from the General Theological Seminary in 1876. He studied later at the University of Leipsic, took orders in 1877 and was in charge of the Memorial Church of the Holy Comforter, Philadelphia, 1879-84. He was rector of All Saints' Church, Worcester, Mass., 1884-1902, and was consecrated first bishop of the diocese of western Massachusetts in January 1902.

Vinton, Arthur Dudley, American lawyer and novelist: b. Brooklyn, N. Y., 23 Dec. 1852. He was graduated from the Columbia Law School in 1873 and has since practised his profession in New York. He was for a time managing editor of the 'North American Review' and is the author of 'The Pomfret Mystery' (1886); 'The Unpardonable Sin' (1888); 'Looking Further Backward' (1898).

Vinton, David Hammond, American soldier: b. Providence, R. I., 4 May 1803; d. Stamford, Conn., 21 Feb. 1873. He was graduated from West Point in 1822, and in 1837 was appointed quartermaster-general of Florida. He served as chief quartermaster with rank of major during the Mexican War; was chief quartermaster of the department of the West in 1852-6, and of Texas in 1857-61. He served through the Civil War as deputy quartermaster-general at New York. In 1864 he was promoted colonel, received brevet rank as major-general in 1865, became assistant quartermaster-general in 1866 and was retired in that year.

Vinton, Francis Laurens, American military officer: b. Fort Preble, Maine, 1 June 1835; d. Leadville, Col., 6 Oct. 1879. He was graduated at West Point in 1856, subsequently studied metallurgy, and was graduated at the Imperial School of Mines in Paris. When the Civil War broke out he became a captain in the 16th United States Infantry, and later colonel of

the 43d New York Volunteers. He participated in the Peninsular campaign, was wounded at the action before Fredericksburg, promoted brigadier-general of volunteers in March 1863, and was professor of engineering in Columbia College 1864-77.

Vinton, Frederic Porter, American portrait-painter: b. Bangor, Me., 29 Jan. 1846. He studied with Bonnat and Jean Paul Laurens in Paris, and at the Royal Academy, Munich. In 1878 he opened a studio in Boston. He is a member of the Society of American Artists, and of the National Academy of Design. He received honorable mention at the Paris Salon of 1890, and has been awarded several medals in this country and in Europe. His work excels in drawing and modeling and in living fidelity to his subjects. Several of his portraits of prominent Americans are in public collections.

Vinton, Iowa, city, county-seat of Benton County; on the Red River, and on the Burlington, Cedar Rapids & Northern railroad; about 30 miles southeast of Waterloo and 22 miles north of Cedar Rapids. It is in an agricultural and stock-raising region. The chief manufacturing establishments are a pearl-button factory, two corn-canning factories (about 1,000 employees during the corn-canning season), flour mill, and creameries. There are six churches. The educational institutions are the State College for the Blind, Tillford Academy, public schools, and a public library. The four banks have a combined capital of \$240,000. The government is vested in a mayor and a council of eight members elected biennially. Pop. (1880) 2,906; (1890) 2,865; (1900) 3,499.

Vi'ol, a class of ancient musical instruments which may be regarded as the precursors of the modern violins. They were fretted instruments with three to six strings, and were played on with a bow. There were three instruments differing in pitch in a set, the treble, tenor, and bass viols, and in concerts they were commonly played in pairs: two treble, two tenor, and two bass. The bass viol, or *viol de gamba*, was the last to fall into disuse, which it did about the close of the 18th century.

Vi'ola. (1) The heroine of Shakespeare's comedy of 'Twelfth Night.' (2) The chief figure in Beaumont and Fletcher's comedy 'The Coxcomb' first played about 1613.

Viola. See VIOLIN.

Viola di Bardo'ne, a musical instrument of the violin kind, strung with six or seven catgut strings, C, B, G, D, A, E, C. Beneath the gut were metal strings varying in number from 16 to as many as 44 arranged in a diatonic order. The sympathetic strings were occasionally plucked with the left hand in playing. The instrument is now obsolete. It was also called *viola di fagatto*, *viola bastarda*, and baritone.

Viola di Fagat'to. See VIOLA DI BARDONE.

Viola de Gamba. See VIOL.

Viola Pompo'sa, a violin similar to the viola de gamba and invented by John Sebastian Bach. It had five strings; the four lower strings were tuned in fifths, and the fifth string was tuned to E to facilitate the execution of extended passages.

Violet, a genus (*Viola*) of mostly perennial herbs of the order *Violaceæ*. The species, of

VIOLET

which about 150 have been described, are natives of the northern and southern temperate zones. In North America there are about 40 species distributed as far south as the mountains of northern Mexico. They are all of humble growth, rarely exceeding six inches in height; bear heart-shaped leaves upon usually long stems, and irregular flowers either solitary or two together on axillary peduncles. The capsular fruits contain numerous globular seeds. In some species, especially *V. palmata*, cleistogamous flowers are borne close to the ground or often beneath it. These flowers are close pollinated in the bud. Of the American species cultivated in gardens only two, *V. palmata* and *V. pedata*, are well known though several others are offered for sale. Of the two mentioned the latter which is known as the bird's-foot violet, is apparently the most promising as a garden plant for improvement. The Australian violet (*V. hederacea*) is grown to a small extent in California. The horned violet (*V. cornuta*) also called bedding pansy has long been popular in gardens for its variously colored long-stemmed flowers which appear in early spring. It is a native of southern Europe. The pansy or heart's-case (*V. tricolor*) is another well-known European species which has long been popular in gardens. (See PANSY.) The most important species, however, is the sweet violet (*V. odorata*). This is a native of western Asia and the Mediterranean region whence it was introduced into cultivation and has given rise to numerous varieties having white and reddish purple as well as variously tinted blue flowers, both single and double. The species is the parent of the popular florists' flower which in the United States ranks third in the list of important commercial flowers. Its season under glass lasts about seven months; that of the rose and carnation, its principal rivals, about nine months. (See FLORICULTURE.)

When violets of ordinary quality will satisfy the needs of the grower the violet plants are not particularly exacting in their demands as to soil, cultivation, etc., but when really choice flowers are required the plants demand considerable skill and attention. It has not infrequently happened that growers who after several years' success with the crop considered themselves experts have been disappointed with their repeated failures to produce good blossoms. Hence the business of growing this plant is steadily gravitating into the hands of specialists. And certain sections of the country are becoming noted for their violet industry. Probably the best known of these violet centres is the district near Poughkeepsie, N. Y.

The plants are propagated by division which may either necessitate their removal from the ground or not. In the former case the old parts are destroyed, in the latter the offshoots or young crowns are separated after becoming well rooted. In each case the little plants are set about 4 inches apart and transplanted to permanent quarters when well established. Cuttings are also widely used. They are either obtained from well developed runners or from young unrooted crowns and treated like cuttings of geranium until well rooted and ready for transplanting in soil.

In general, the florists' violet will thrive well in any rich loamy soil, but best results are generally obtained with soil resulting from the de-

cay of thick sod pared from an old blue grass pasture upon sandy but rather heavy loam. This should be prepared the season previous with alternate layers of well-decayed cow manure, and after six or more months' exposure to the weather, sliced when about one and one half pounds of bone meal should be added to each cubic yard of soil. This soil is then spread on benches or made into solid beds in the greenhouses or frames, the former preferred. The plants are set from 8 to 12 inches asunder in rows 10 to 18 inches apart, according to the size of the variety, the single flowered varieties usually demanding the maximum space. Most growers agree that planting in early spring is preferable to other times because the plants become well established, vigorous and strong, whereas if set in late spring or later they do not seem to thrive so well during the hot weather. At all times weeds must be kept out of the beds and except when needed for propagation the runners should be removed so as to divert growth toward flower production. The summer temperature should be kept as low as possible and the winter temperature between 45 and 50 degrees at night with a maximum day temperature of 60 degrees. The beds should be kept moist but not wet at all times and the supply of fresh air abundant. Careful attention to these two details of management are among the most important means of preventing the so-called plant diseases which sometimes destroy the crops of careless growers.

The above method of growing violets continuously under glass is considered the most satisfactory since the plants are always under complete control. There are, however, other methods which are of more or less importance, such as combining house culture with field culture, the plants being cultivated out of doors until early or mid autumn and then transplanted to the greenhouse. Large quantities are also cultivated in frames either with or without artificial heat, the plants being grown either in the field or in beds which are covered with the frames at the approach of cold weather. This method is most popular where the winter temperature is not very low, as in Virginia and southward. Violets are sometimes grown in pots but this method is considered too expensive for commercial purposes and is also likely to prove unsatisfactory and inconvenient.

Since the violet is esteemed mainly for its fragrance, the flowers should be gathered just before reaching prime condition and placed on sale as soon as possible because the odor is evanescent. A definite knowledge of the demands of the market is also essential since some markets demand bunches of certain sizes or forms and will not handle other sizes or forms profitably. The bunching demands great skill and taste and in the larger establishments is usually done by girls.

Several insects feed upon the violet, the most common being the black fly (*Rhopalosiphum viola*), the green fly (*Aphis* sp.), gall-fly (*Diplosis violicola*), violet sawfly (*Emphytus canadensis*) and the greenhouse leaf tyer (*Phlyctania rubigalis*). The red spider (*Tetranychus telarius*) which is not an insect but a mite, also lives upon the foliage. Its visitations may be prevented by due attention to ventilation and humidity of the air. The method of controlling the others seems at present to be hydro-

VIOLET FANE — VIOLLET-LE-DUC

cyanic acid gas, but intelligent management is considered more satisfactory. It is preventative rather than remedial. The so called diseases are most effectively prevented by attention to watering, ventilation and ample space for each plant to grow in.

Consult: Galloway, 'Violet Culture' (New York 1900); Bailey, 'Cyclopedia of American Horticulture' (New York 1900-2).

Violet Fane. See CURRIE, LADY MARY.

Violet-green Swallow. See SWALLOW.

Vi'olin, a musical instrument consisting of four strings stretched by means of a bridge over a hollow wooden body, and played on with a bow. The principal parts of the violin are the scroll or head in which are placed the pins for tightening and slackening the strings; the *neck*, which connects the scroll with the body and to which the *finger-board* is attached, that is, the board upon which the strings are pressed down or stopped by the fingers of the left hand as it holds the neck in playing; the *belly* or upper surface of the body, over which the strings are stretched, and which has two sound holes, one on each side in this shape ; the *back* or under

side; the *sides* or *ribs*, uniting the back and belly and completing the body; the *tail-piece*, a piece of wood of somewhat triangular shape, to the broad end of which the strings are fastened, and which is attached by a piece of catgut to a knob at the opposite end of the body from the head, and so is stretched above the belly; and the *bridge*, rising between the tail-piece and the finger-board, with one of the sound-holes on each side. The back and belly have both a considerable convexity, and the edge of the bridge on which the strings rest is also convex so as to allow of each being touched separately by the bow. Some instruments consist of as many as fifty-eight different pieces, but so minute a division is not necessary. The back, neck, and sides are generally of sycamore, the belly of deal, the finger-board and tail-piece of ebony. Almost all the different pieces are fastened together with glue. The strings are of catgut, the lowest or bass-string being covered with silvered copper wire, silver wire, or even gold wire.

Instruments of the violin kind have been in use from an unknown antiquity. The viola, which preceded the violin in Europe, has been traced back to the 8th century. In several important respects the violin is superior to almost every other instrument, and there is none which combines so many excellencies. Within its range it can take every interval of pitch to the minutest fraction, its susceptibility of division being limited only by the delicacy of manipulation of the performer; so that it can always be played either in just intonation, or in any temperament required by the accompanying instruments. It is thus equally adapted to solo and orchestral performances. For the former it is fitted by its clear and brilliant tone, as variable in volume as in intonation, inexhaustible in continuity and variety of shading, and capable of the sharpest strokes of *staccato* as well as of the most sustained efforts of *legato* music. Its place in the orchestra is marked by these perfections as the leading one, to which the melody is intrusted. As a solo instrument it has also a peculiar faculty of imitation, not only of the tones of other instruments, but of non-musical

sounds, as far as they are capable of musical imitation. This and its indefinite range are somewhat liable to abuse.

As an orchestral instrument its powers are multiplied by the construction of similar instruments varying in size, but nearly identical in principle and form of construction. The full orchestral set consists of the violin, which is used for first and second parts; the viola, or tenor violin; the violoncello, or bass-violin; and the violone, contra-basso, or double-bass violin, which usually accompanies the violoncello at an octave of interval. The four strings of the violin are tuned at intervals of fifths, thus

The highest range of the instrument depends to some extent upon the performer, but the high notes when forced are apt to be thin and squeaky. Its legitimate extent exceeds three octaves. The violin can, to a limited extent, be made to produce harmony by sounding two or three strings together, but this is only a *tour de force*, not suitable for rendering a sustained composition, although a fugue in four parts for a single violin has been written by Sebastian Bach. The viola is tuned thus the music being written in the alto clef. Its range extends to the G above the treble clef.  The violoncello is tuned

Its compass extends to the A above the second line in the treble clef. With the assistance of harmonics it may be carried one or two octaves higher. The double-bass has three, four or five strings.

The structure of the violin is still imperfectly understood by musical mechanists. The finest violins are by old makers, which cannot be imitated, and the precise cause of their superiority has never been satisfactorily explained. The Cremona violins stand in the first rank, the celebrated masters of this school being the Amati, Antonio Stradivari (Straduarus), and Giuseppe Guarneri (Guarnerius); of German makers Stainer or Steiner and Klotz (both belonging to Tyrol) are the most celebrated; Vuillaume of the French; and Forrest of the English.

Viollet-le-Duc, vē-ō-lā-lē-dük, **Eugene Emanuel**, French architect and historian: b. Paris 27 Jan. 1814; d. Lausanne, Switzerland, 17 Sept. 1879. He made special study of mediæval architecture in Italy and France; and became professor in the École des Beaux Arts in 1863. His great work is 'Dictionary of French Architecture from the 11th to the 16th century' (10 vols. 1854-69). His other chief works are: 'Essay on the Military Architecture of the Middle Ages' (1854); 'Dictionary of French House Furniture from the Carolingian Epoch to the Renaissance' (6 vols. 1854-75); 'Discourses on Architecture' (1858-72); 'Chapels of Notre Dame de Paris' (1867-9); 'Mémorial on the Defense of Paris' (1872); 'History of a House,' 'History of a Fortress,' 'History of Human Dwelling Places,' 'History of a City Mansion and of a Cathedral' (4 vols. 1873-8). As a practical architect he restored the east towers of Saint Ouen's, Rouen, and the Cathedral at Carcassonne, besides executing many other works, among the most important of which are the restorations of the chateau of Pierrefonds and the fortifications of Carcassonne. Consult

VIOLONCELLO — VIPERS

Sauvageot, 'Viollet-le-Duc et son oeuvre' (1880); Saint Paul, 'Viollet-le-Duc, ses travaux d'art, etc.' (1881).

Violoncello, vē'ō-lōn-chēl'ō or vī'o-lon-sēl'ō, a powerful and expressive bow instrument of the violin kind, held by the performer between the knees, and filling a place between the violin and double-bass. It has four strings, the two lowest covered with silver wire. It is tuned in fifths, C (on the second ledger-line below the bass staff), G, D, A, reckoning upward, and is an octave lower than the viola or tenor violin. Its ordinary compass from C on the second ledger-line below extends to A on the second space of the treble, but soloists frequently play an octave higher.

Vioménil, vē-ō-mā-nēl, Antoine Charles du Houx, BARON DE. French soldier: b. Vosges, France, 3 Nov. 1728; d. Paris 9 Nov. 1792. He entered the army at 12, served in Holland and Hanover, became brigadier-general in 1762, and commanded a regiment in the Corsican campaign of 1768-9. He was promoted major-general in 1770, served in Poland in aid of the confederation of Bar and captured the castle of Cracow. He was appointed second in command under Rochambeau of the army sent to the aid of the American revolutionists in 1780, won the Grand Cross of the Legion of Honor for his conduct at Yorktown in 1781, and was promoted lieutenant-general. In 1783-9 he was governor of La Rochelle, and while defending Louis XVI., during the attack on the Tuileries in 1792 received injuries from which he died.

Vipers, a family (*Viperidae*) of venomous snakes belonging to the suborder *Solenoglyphia* and closely related to the *Crotalidae*, or pit-vipers and rattlesnakes. In the character of the poison-apparatus the vipers closely resemble the rattlesnakes, under which heading a full description of it will be found, but they differ as a family from the *Crotalidae* in lacking the preorbital sensory pit and the excavation of the maxillary bone for its accommodation. None of them have the tail terminated by a rattle; but in form, scale-characters and habits they exhibit much the same range of variations as the various genera and species of the pit-vipers. Their distribution, however, is totally different for while the *Crotalidae* are scarcely represented outside of America the *Viperidae* are absolutely confined to the tropical and temperate regions of Europe, Asia and Africa, the latter having the greatest number and most formidable species. The family embraces forty or fifty species, many of which are quite variable. The typical vipers are the characteristic poisonous snakes of most of Europe and belong to the genus *Vipera*, which has two rows of scales or urosteges on the short tail, the head covered almost exclusively with numerous small scales, with those at the end of the snout and above the eyes often turned upward, and the body-scales keeled.

The common viper or adder (*Vipera berus*) is found throughout most of temperate Europe, including England and Scotland, but is absent from large areas, while in others of different geological formation and even in well-cultivated districts it is common. It attains a length of from 1½ to 2 feet, and is variously colored. Its most frequent and stable markings appear to be a brownish-yellow ground, with a series of continuous zigzag markings along the back, and

a set of triangular black spots along each side. Specimens are frequently found with light tints and sometimes nearly black. The viper is the only poisonous reptile of Britain. Its bite is seldom productive of fatal consequences, but may induce pain, sickness, fever, and even delirium and as a sequence a protracted period of nervousness and a tendency for the wound to suppurate. The effects have been known to persist for a fortnight or more; and in children a fatal result has occasionally followed the adder's bite. The food consists of frogs, mice, birds, eggs, and they hunt chiefly at night, quartering the ground systematically and following the runways of meadow mice. The viper is viviparous — retaining its eggs within the body till the young are hatched, and the young are known to habitually retreat into the mouth and oesophagus of the mother when threatened by danger. Like the rattlesnakes vipers often collect in large numbers in caves and holes during the season of hibernation.

The common asp of southwestern Europe, the (*V. aspis*) has the snout plate turned upward, a character which is much exaggerated in the prominent nasal horn of *V. ammodytes*, of southeastern Europe. Supra-orbital horns, recalling those of the horned rattlesnake of the southwestern United States are found in *Cerastes* and *Clotho*. The former inhabit the hot desert-regions of northern Africa and southwestern Asia, one small and very venomous species being the horned viper (*C. cornutus*). The asp used for suicide by Cleopatra, and of Scripture is not a viper, but one of the cobras (*Naja haje*). To *Clotho* belongs the large and dangerous rhinoceros-vipers of Africa. One of the most dreaded serpents of Africa is the puff-adder (*Bitis arietans*) which, besides some differences in arrangement of the head-scales including the absence of any horns, has the nostrils directed nearly upward. It reaches a length of five feet, and is of robust build, the appearance of which is further enhanced by its habit of puffing up the body when molested. The puff-adder inhabits dry plains throughout the greater part of Africa and like the horned vipers conceals itself by partially covering its body with loose earth. In general habits it resembles the European viper but is more sluggish and owing to its large size and the virulence of its venom is exceedingly dangerous to man and beast. Its bite is followed by the most severe constitutional and local symptoms, including a rapid and progressive gangrene. In Africa are found also the tree-vipers (*Atheris*), small snakes with prehensile tails and usually bright green colors. Several species of vipers are among the most poisonous snakes of India and contribute largely to the number of fatalities resulting from snake bites in that country. The most notable are Russell's viper or tipcolonga (*Daboia russellii*), reaching a length of five feet, and the little, but for that reason even more dangerous, krait (*Echis carinata*). The name viper is also applied erroneously to several American snakes, especially to the copperhead and moccasin (qq.v.) and to the hog-nosed snake (q.v.), the last of which is quite harmless, notwithstanding its unfortunately bad reputation and threatening appearance.

A number of mostly small, poisonous snakes of Africa and India have been separated from the *Viperidae* under the names *Causidae* and

VIPER'S GRASS—VIREOS

Attractaspidae. They differ variously in having large head plates, grooved fangs, no postfrontal bone or in being oviparous. The vipers of Australia are related to the cobra (q.v.) and belong to the family *Najida*.

Viper's Grass. See SCORZONERA.

Virchow, vēr'hō, Rudolf, German scientist: b. Schivelbein, Prussia, 13 Oct. 1821; d. Berlin 5 Sept. 1902. He studied medicine in Berlin in 1839-43, and in the latter year became a surgeon's assistant. From 1844 to 1846 he was assistant at the Charité Hospital, and in the latter year he became prosector there. He qualified in 1847 as a lecturer at the University of Berlin, and in that year also he was associated with Benno Reinhardt in founding the 'Archiv für pathologische Anatomie und Physiologie und für klinische Medizin,' world-famous as "Virchow's Archives," which he edited alone from Reinhardt's death in 1852 till his own. He made himself known as a pronounced democrat in the year of revolution, 1848, and his political activity caused the government to remove him (1849) from his prosectorship, but he was soon reinstated, and accepted the chair of pathological anatomy at Würzburg. In 1852 he became joint editor of the *Cannstatt* reports on the progress of medicine, which he continued in conjunction with others till his death. In 1856 he returned to Berlin as professor of pathological anatomy, general pathology, and therapeutics, and director of the recently founded pathological institute. He became a member of the Municipal Council of Berlin in 1859, and began his career as a civic reformer. Elected to the Prussian Diet in 1862, he became leader of the Radical or Progressive party; and in 1880-93 he was a member of the Reichstag. Virchow was a determined opponent of Bismarck's policy, and in 1865 was challenged to a duel by the "man of blood and iron." He exercised especial influence in matters relating to public health, and during the wars of 1866 and 1870-1 he took an active part in organizing the army sanitary services. During his membership of 40 years in the Berlin Municipal Council he was active in promoting the sanitary improvement of the city. In 1870 he assisted in founding the *Deutsche und Berliner Gesellschaft für Anthropologie, Ethnologie, und Urgeschichte*, of which he was several times president, and in 1879 he made a journey to the site of Troy, described in 'Beiträge zur Landeskunde in Troas' (1879) and 'Alttröjanische Gräber und Schädel' (1882). He visited England in 1893 and delivered the Croonian lecture to the Royal Society on 'The Place of Pathology in Biological Studies,' receiving on the occasion the honorary degree of D.C.L. from Oxford. In 1898 he delivered the Huxley lecture in London, his subject being 'Recent Advances in Physiology.'

Virchow was the founder of cellular pathology, was scarcely less distinguished in archaeology and anthropology, and was the author of many important works, among which are: 'Handbuch der speciellen Pathologie und Therapie' (1854-76), prepared in collaboration with others; 'Vorlesungen über Cellularpatho-

logie in ihrer Begründung auf physiologischer und pathologischer Gewebelehre' (1859), his chief work, forming in the 4th edition the first volume of 'Vorlesungen über Pathologie' (1862-71); 'Vier Reden über Leben und Kranksein' (1862); 'Ueber den Hungertyphus' (1868); 'Ueber einige Merkmale niederer Menschenrassen am Schädel' (1875); 'Beiträge zur physischen Anthropologie der Deutschen' (1876); 'Die Freiheit der Wissenschaft im modernen Staat' (1877); 'Gesammelte Abhandlungen aus dem Gebiete der öffentlichen Medizin und der Seuchenlehre' (1879); etc. It was in fulfilment of the desires of Virchow that the German government erected in Berlin the Pathological Institute and Museum, the greatest institution of its kind in the world. Consult his 'Life' by Beecher (1891).

Virden, vēr'dēn, Ill., city in Macoupin County; on the Jacksonville & S. L., and the Chicago & A. R.R.'s; about 20 miles southwest of Springfield and 30 miles southeast of Jacksonville. It is in an agricultural region in which there are large beds of bituminous coal and valuable deposits of clay. The chief manufactures are brick and tile. The principal shipments are farm products, coal, clay products, and dairy products. Pop. (1890) 1,610; (1900) 2,280.

Vir'eos, or Greenlets, a family (*Vireonidae*), of small fly-catching passerine birds, restricted to America, where they range from Patagonia to Canada. Bill conical, much compressed, decurved at end, and notched, but scarcely toothed, with numerous conspicuous nictal bristles; frontal feathers bristly and erect, or bent slightly forward; nostrils overhung by membrane; 10 primaries; tarsus usually longer than middle toe and claw; lateral toes generally unequal. The vireos are all small, none of them exceeding about seven inches in length and their colors are plain, generally more or less greenish above, with few conspicuous markings beyond wing-bars and eye-stripes. The iris is frequently bright in color, red, yellow or pure white. The vireos are typically woodland birds, many of them preferring well-watered ravines, others swamps, while some inhabit open woods, parks or the trees of city streets. They are migratory and characteristically insectivorous, and search for small caterpillars among the leaves or in cracks of the bark, or capture insects on the wing; and they exhibit great activity in these pursuits. Some of the species also eat berries, particularly in the fall. Their nests are very characteristic, being deep cups composed of well-felted vegetable fibres lined with fine grasses, often ornamented externally with bits of paper, lichens, etc., attached with spiders web, and nearly always pendent from the twigs of a horizontal fork in a low limb. The three or four eggs are pointed, of a crystalline whiteness and spotted with sharply defined reddish brown markings. Generally the song is weak, monotonous and repeated almost continuously, but some species are excellent songsters.

South and Central America is the headquarters of this family of birds and there the greatest number of generic types and the greatest variety in habits are exhibited, some of the species approaching the shrikes in structure, and some exhibiting marked distinctions in the colors of the sexes. All of the twelve North American

VIRGIL — VIRGIN ISLANDS

species, some of which include several subspecies, fall within the typical genus *Vireo*. While the differences in the colors, form of the often stout, shrike-like bill, and proportions of the body are evident enough to the initiated, no group of birds is more confusing to the tyro in ornithology than this and the reader is referred for descriptions of the species to some standard work on ornithology. The red-eyed vireo (*V. olivaceus*) is generally the best known of the eastern species. It is strictly a bird of the woods and is noted for its quarrelsomeness, activity and the energy and persistence with which it sings its simple lay continuously as it searches for insects throughout the hottest summer days. The warbling vireo (*V. gilvus*), of still wider range and locally almost as common, is a striking contrast to the last in that it forsakes the woods for the city parks and even the shade trees along much traveled streets and because of the surpassing sweetness of its song which, however, is so soft that it does not always reach the ear from the tree-tops where these birds dwell. A much more conspicuous songster, because of its greater power and marked ventriloquistic ability, is the white-eyed vireo (*V. noveboracensis*), a species which must be sought in regions sparsely timbered or covered with a scrubby growth or in thickets bordering swamps. The blue-headed vireo (*V. solitarius*) is recognizable as the largest and most stoutly built of our species, the yellow-throated vireo (*V. flavifrons*), about equal in length but more slender than the blue-head, by its unusually bright colors, while the remaining species are chiefly restricted to the west and southwest.

Virgil. See VERGIL.

Virgil, vēr'jil, **Polydore**, English ecclesiastic and author: b. Urbino, Italy, about 1470; d. there 1555. He was educated at Bologna and dedicated his first work, 'Proverbiorum Libellus' (1498), to the Duke of Urbino. His 'De Inventoribus Rerum,' which followed (1499), became popular and was translated into English, Spanish and Italian. Being appointed chamberlain to Pope Alexander VI., he was sent to England in 1501 to collect the Peter's-pence with his kinsman, Adrian de Castello, then Cardinal Santi Chrysogoni, who was soon after made Bishop of Hereford. Polydore was presented to the living of Church Langton, Leicestershire, in 1503, and after obtaining several preferments and becoming naturalized in England, he was imprisoned for sending abroad slanderous letters about Wolsey (1515), but apparently was soon released. In 1525 he published the first genuine edition of Gildas, the year after the treatise 'De Prodigis,' dialogues in attack upon divination. His most important work, 'Historiæ Angliæ Libri XXVI.,' appeared in 1534; the 27th book was added in 1555. About 1550 he obtained leave from Edward VI. to return to Italy for his health's sake, without forfeiting his preferments and there he lived in Urbino till his death. His 'History' is a work of research, written in elegant Latin, and is the fullest narrative of the reign of Henry VII. extant. He spared no pains to ensure accuracy, and a rational mind hindered him from accepting the exploits of Brut and Arthur as related by Geoffrey of Monmouth. Consult: The Camden Society's translation of Polydore Virgil's 'History of England.'

Virgin Islands. That group in the West Indian archipelago which lies between Porto Rico and the Caribbees, and includes: (1) The Danish possessions, namely, St. Croix, or Santa Cruz, St. Thomas, and St. John; (2) the dependencies of the United States, Vieques, or Crab Island, and Culebra, which formerly belonged to Spain and are now administratively included with Porto Rico; and (3) the English Virgin Islands, Tortola, Virgin Gorda, or Spanish Town Island, and Anegada, or Drown Island. Numerous smaller uninhabited keys, islets, rocks, and reefs extend from the deep Anegada Passage toward the southwest in a long row. When Columbus, in the course of his second voyage, saw the islands, "they appeared innumerable. To the largest of them he gave the name 'Saint Ursula,' and to all the others, 'the 11,000 Virgins.'" ('Scritti di Cristoforo Colombo,' pubblicati ed illustrati da Cesare de Lollis, Vol. I., page 151). The total area is about 372 square miles, and the dwindling population about 57,000. Geographers sometimes treat of St. Croix separately, owing to its distance from the others (it is 37 miles south of St. Thomas); but it may be quite properly regarded as a member of the Virgin group, which it resembles in geognostic aspects, besides being identified politically with St. Thomas and St. John. As for the two islands belonging to United States, the smaller, Culebra, is interesting because it has been selected as the site of one of the two Porto Rican naval stations of the United States; politically, it was described (census of 1899) as a ward of the Vieques district, department of Humacao, Porto Rico; and its population in 1899 was 704. (See VIEQUES.) Brief accounts of the Danish and English islands follow: St. Croix (area 74 square miles, population about 18,000) was occupied by Spaniards, Englishmen, and Frenchmen before it was sold to the Danes (1733). The range of temperature is between 66° and 82°. Sugar cane and its products formed the main source of wealth in the past, and this industry has suffered somewhat less here than in other parts of the West Indies during recent years. The soil is fertile; the surface of the island in the interior rolling or hilly, and, where it is not under cultivation, covered with a luxuriant growth of forest trees; the shores high and bold. Most of the inhabitants are English-speaking blacks. The towns are called Christiansted and Frederiksted. The island of St. Thomas (area 23 square miles, and population about 32,000) has a harbor, well sheltered from the trade-winds, where formerly the Royal Mail Steamship Company made its headquarters; and regular or occasional visits from the vessels of other important lines made it in times past a prosperous, busy port. Unfortunately the harbor has no complete defence against destructive hurricanes and earthquake waves: on several occasions in the last century great damage was done there, and in 1867 every vessel in it was wrecked. The capital, Charlotte Amalia, where nearly one half of the inhabitants of the island reside, despite its theatre, clubs and hotels, and an effort now and again to adopt some characteristics of a modern town, has become a rather shabby place since the West Indian sugar industry ceased to be profitable, and more particularly since commerce has deserted

VIRGIN MARTYR—VIRGINIA

it in favor of rival ports. St. John (also written St. Johns) is a still smaller island with less than 1,000 inhabitants. Negotiations for the purchase of the Danish Islands by the United States proceeded during the years 1865-1869; in 1870 Congress declined to ratify the treaty submitted to it by President Grant. In 1902, when the governments of the United States and Denmark agreed upon another treaty with the same end in view, the Danish Landsting refused consent (see *WEST INDIES*). The most interesting of the British Virgin Islands, is Tortola (18 miles long and seven miles wide; population about 5,000); an island of naked, rough mountains and arid lowlands, fertile only in historic contrasts; at first infamous as a resort of pirates, and later the home of "the peaceful Quakers, who freed the slaves and made them grants of land. The emancipated negroes then deserted the island, and many of the impoverished whites quickly followed them." (Hill's 'Cuba and Porto Rico.')

Nearly two thirds of the inhabitants emigrated. It is administered (by a nominated executive council) as one of the five presidencies comprised in the Leeward Islands government; the capital, Roadtown, has only 400 people. Products are sugar and cotton in very small amounts. Virgin Gorda and Anegada are almost uninhabited. The former had at one time extensive plantations, but many of these have been abandoned; the latter is so low that, it is said, the sea often breaks over it, and yet it affords pasturage for sheep and cattle. Finally, the unique distinction of the group as a whole must be mentioned. It is this: The islands suggested to Columbus by their delicate beauty nothing so much as a procession of saintly maidens; but they are really the summits of rugged enormous mountains, "the submerged eastern end of the Antillean mountain chain." Just across Anegada Passage, in the volcanic Caribbees, there is a different geologic story. Compare works cited in *WEST INDIES*, especially Griffin, 'A List of Books' (with references to periodicals) on the Danish West Indies, Washington, 1901; and Robert T. Hill, 'Cuba and Porto Rico, with the Other Islands of the West Indies.'

MARRION WILCOX.

Authority on Latin-America.

Virgin Martyr, The, a powerful tragedy by Philip Massinger and Thomas Dekker. It is based on the legend of the martyr Dorothea, slain in the reign of Diocletian, and licensed in 1620, was first printed in quarto form in 1622. It contains many passages of great beauty as well as several scenes most repellant in their coarseness but which in all probability are not the work of Massinger.

Virgin Mary, The. See *MARY, THE MOTHER OF JESUS.*

Virgin Queen, The, a term popularly applied to Queen Elizabeth, on account of her determination not to marry.

Virgin Soil, a novel by Ivan Turgeneff, published in 1876, and in an English translation in 1877. Turgeneff gives in 'Virgin Soil' a graphic picture of the various moral and social influences at work in the modern Nihilistic movement in Russia. The motive of the story is deep and subtle, and developed with masterly skill and refinement.

Virginal, an obsolete stringed instrument played by means of a keyboard, like the modern pianoforte. It was in form like a box, or desk of wood without legs or supports, and was usually placed on a table or stand. The strings were of metal, one for each note, and the sound was made by means of pieces of quill, whalebone, leather, or occasionally elastic metal, attached to slips of wood which were provided with metal springs. The compass was about three octaves.

Virginia, vēr-jin'ī-ā, the daughter of Lucius Virginius, whom Appius Claudius, the decemvir, endeavored to carry off from her parents. Her father, finding he could not save her by any other means, slew her in the open forum and raised an insurrection, which overthrew the decemvirate and restored the old magistracy (449 B.C.). The story is given in Livy, and Dionysius of Halicarnassus, and one of Macaulay's 'Lays' is based on it.

Virginia, one of the 13 original States of the Union, often called the "Old Dominion" and the "Mother of States and Statesmen," the most southern of the Middle Atlantic States. In size it is the 24th State in the Union, and in population the 17th. It is situated between lat. 36° 30' and 40° 38' N., and lon. 75° 10' and 83° 43' W. The greatest length from east to west is 475 miles, and the greatest width from north to south 190 to 200 miles. It has a land area of 40,125 square miles and a water area of 2,325 square miles. It is bounded north by West Virginia and Maryland; east by Maryland and the Atlantic Ocean; south by North Carolina and Tennessee, and west by Kentucky and West Virginia. Pop. (1900) 1,854,184. Capital, Richmond.

Topography.—The surface of the State is varied, including parallel ranges of mountains in the west, an undulating plateau in the centre, and a low-lying, nearly level plain along the coast. These differences in surface affect the resources and in some degree control the industrial conditions of the three principal parts of the State. The mountain section is called the Appalachian Province; the plateau, the Piedmont Province, and the low, level plain, the Coastal Plain Province. They extend from New York to Central Alabama, so that in Virginia there is only a section of each of them. The tidewater region, penetrated by the waters of the ocean, of Chesapeake Bay and its inlets, and of the tributary streams, is divided into numerous peninsulas, and has a coast line of 1,400 miles. The middle section of the State is an undulating plain with an elevation from 200 to 500 feet and extends to the foot-hills of the Appalachian range. The western part of the State is mountainous, the Blue Ridge and Piedmont ranges crossing the State in a southwesterly direction, and the Alleghenies forming the boundary of West Virginia. The valley section is a broad belt of rolling country diversified by hills, ridges, and river valleys, lying between the Blue Ridge and Allegheny Mountains. This region contains the valleys of the Shenandoah, Roanoke, James, Kanawha, and Holston rivers. The highest peaks of the Blue Ridge in Virginia are Marshall (3,150 feet), near Front Royal, the beautiful twin peaks of Otter (3,993 feet), in Bedford County, and Mount Rogers, or Balsam Mountain (5,760 feet) in Grayson County.

VIRGINIA

Rivers.—The more important rivers are the Potomac, Rappahannock, York, James, Blackwater, and Roanoke. The Potomac River forms the boundary between Virginia and Maryland, and by its affluents, the North and South Branches, and the Shenandoah, drains the upper portion of the valleys of the Alleghenies. The Rappahannock, with its affluents, the North Fork and Rapidan, is navigable as far as Fredericksburg for vessels of 140 tons. The Mataponi, formed by the junction of four Piedmont rivers or "runs"—the Mat, the Ta, the Po, and the Ny; the Pamunkey, formed by the North Anna and South Anna; the Chickahominy, the Blackwater, and the York—are all typical Virginia rivers. The James is the best known river of Virginia. Its waters gather among the Allegheny Mountains. It passes in narrow gorges through several ranges before it enters the Great Valley, in Botetourt County. It leaves the Great Valley through a notable watergap in the Blue Ridge, at Balcony Falls, passing through a picturesque series of cataracts and rapids. The Roanoke, next to the James, is the principal river of Virginia. It rises in Montgomery County, and cuts through the Blue Ridge in Roanoke Watergap. From this point it is known as the Staunton until it joins the Dan, which is partly in Virginia and partly in North Carolina. From the junction it is again known as the Roanoke. The Appomattox, the Nottoway, and the Meherrin are typical rivers, much like the Rappahannock. New River represents a type different from other Virginia rivers. It rises on the Piedmont Plateau and flows westward through the Blue Ridge, across the Great Valley, through the Appalachian ranges, into the Great Kanawha, which flows into the Ohio. The Holston, the Clinch, and the Powell rivers rise in the southwest, between the mountain ranges and unite in the Tennessee.

Climate.—The climate of Virginia is peculiarly healthful, and not subject to extremes either of heat or cold. The mountain ranges on the west protect the Great Valley from the cold northwestern winds of winter, while its elevation above the sea level protects it from the extremes of heat during the summer, and makes it equally desirable as a place of residence at all times. In the eastern part the heat of summer is tempered by sea breezes and the atmosphere is dry. The mean annual rainfall is from 40 to 45 inches, and is well distributed throughout the year.

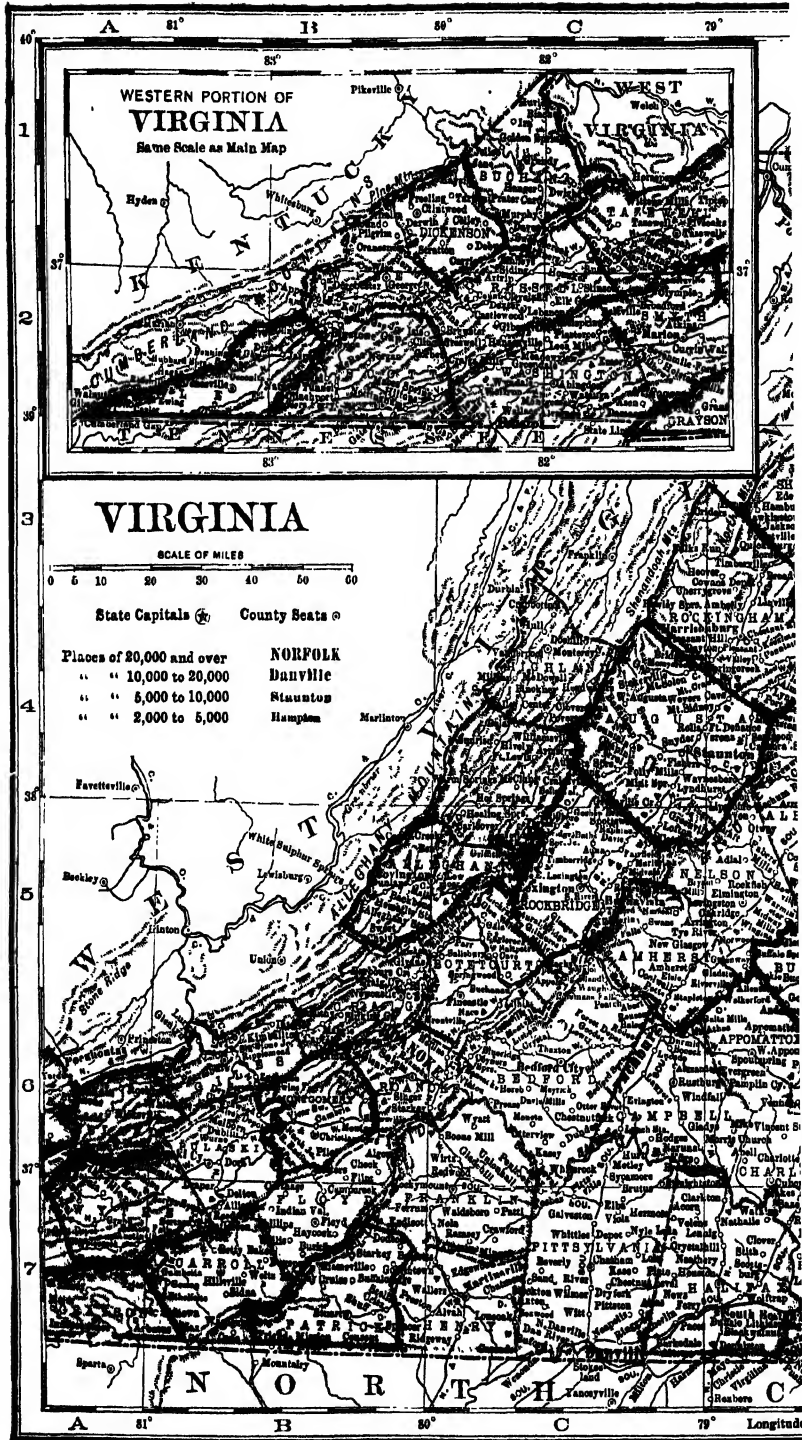

Geology.—The eastern part or coast line of Virginia is of Tertiary formation, consisting of sands, clays, and marls, while further inland Miocene strata occur and abut against granite, gneiss, and other metamorphic rocks. This metamorphic belt contains deposits of gold and iron. Two secondary belts cross the State parallel to the Blue Ridge and contain extensive coal measures. The valley is of lower Silurian formation.

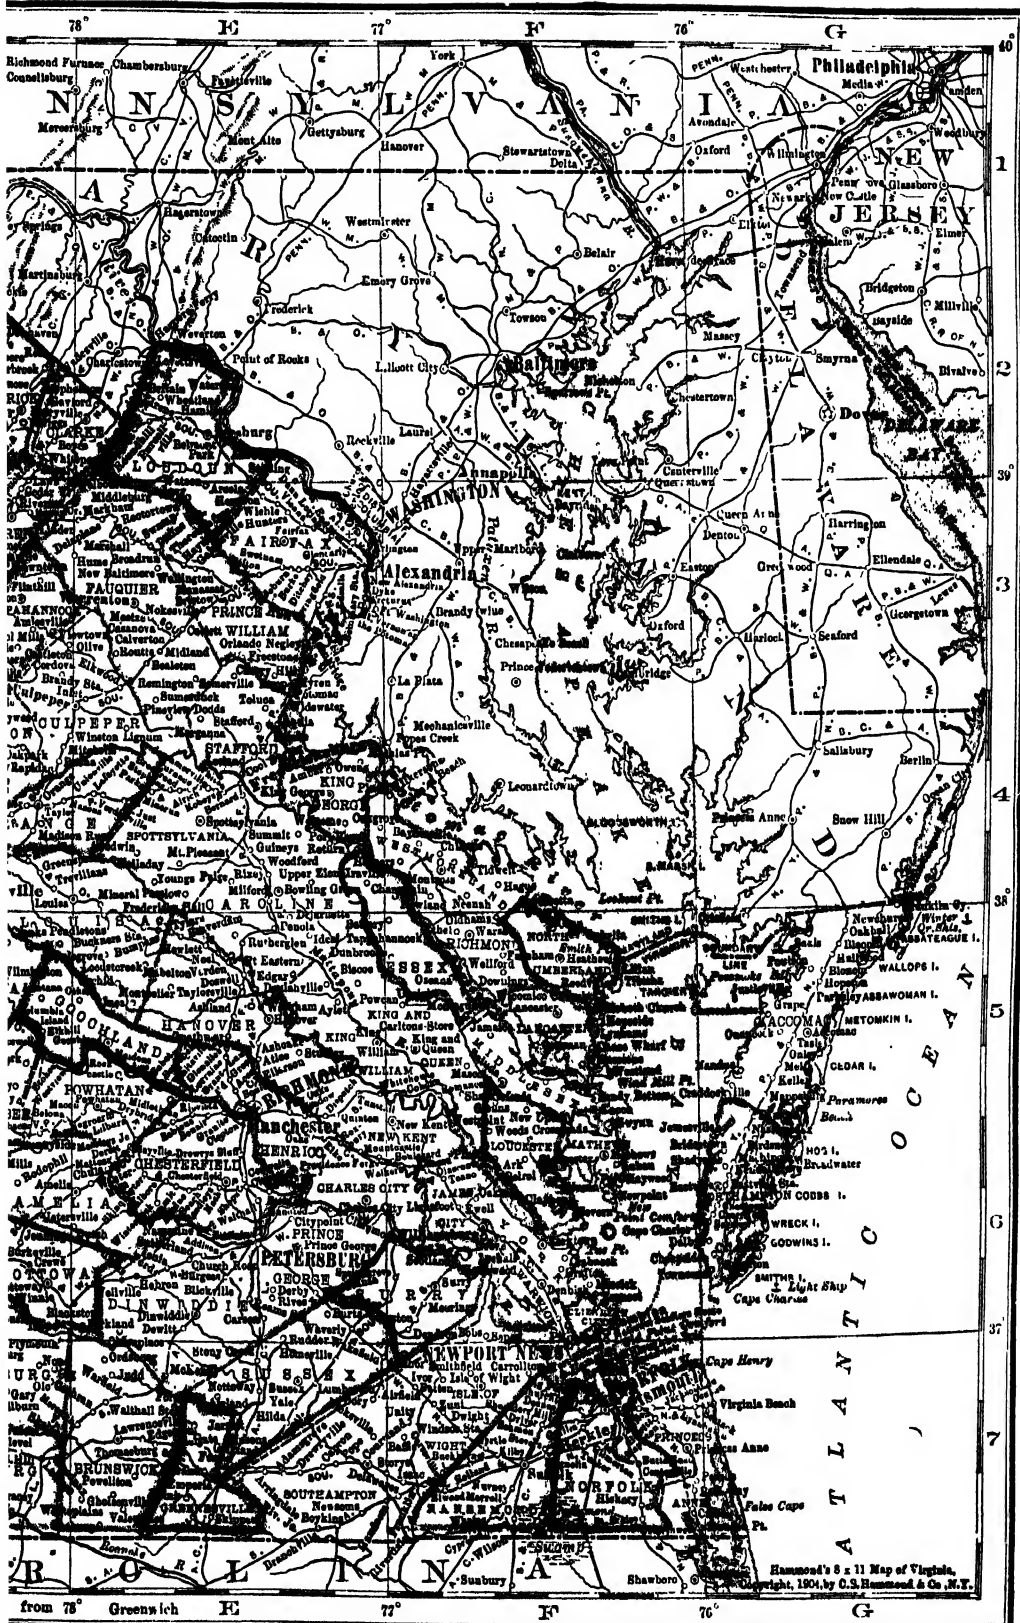

Minerals.—The State is rich in coal and iron, and there are also mines of gold, lead, copper, zinc, barytes, manganese, and salt. The first gold and the first coal mined in the United States came from Virginia. Granite, sandstone, limestone, marble, and slate, suitable for building, are quarried. Bituminous or soft coal, is found in the counties of Chesterfield, Henrico, Powhatan, Goochland, and Cumberland, but the

great coal deposits of the State are found in the mountains of the southwest. In what is known as the Blacksburg region extensive developments are being made by coal operators from Pennsylvania and other States. Breakers recently erected in the Blacksburg district have a capacity of 1,000 tons daily. Agencies have been established in Cincinnati, Saint Louis, Roanoke, and Richmond, where the coal sells in competition with the Pennsylvania coal. Iron ores abound in the Valley counties, in the Piedmont counties, and in the Appalachian counties of the west and southwest. There are large manganese mines in the Shenandoah Valley. Gold is mined in Louisa County, also in Spottsylvania. Zinc is also mined in the southwest. Salt has long been mined, and the salt works of Saltville are noted. The principal mineral productions in 1900 included coal, 2,393,754 short tons, valued at \$2,123,222; coke, 685,156 short tons, valued at \$1,464,550; portland cement, 58,470 barrels, valued at \$73,099; gypsum, 11,940 short tons, valued at \$18,111; mineral waters, 1,141,859 gallons, valued at \$272,868; gold, 155 fine ounces, valued at \$3,200; granite, valued at \$211,080; sandstone, \$6,000; slate, \$190,211; limestone, \$403,318; and clay products, \$1,093,784.

Natural Attractions.—Virginia abounds in natural curiosities of great interest. The natural bridge in Rockbridge County is one of the most remarkable natural arches in the world. Weir's cave, in Augusta County, ranks among the stalactite caverns of the United States. Madison's Cave, in the same county, about 300 feet in diameter, has two extensive basins of very clear water, and from the vaulted arches above depend great numbers of brilliant stalactites. The Blowing cave, near Millborough, between the Rockbridge and Bath Alum springs, during the hot weather emits a current of cold air with such force as to prostrate the weeds at the entrance; and during the winter a current of the cold air from without rushes into the cave. There is a flowing and ebbling spring near this cave, and there is also one in Brook's Gap, in Rockingham County. "The Hawk's Nest," called also "Marshall's Pillar," on New River, in Fayette County, an immense pillar of rock connected by a narrow passageway with the table land in the rear, has a perpendicular descent on all sides save this passage of more than 1,000 feet to the valley and river below. Caudy's Castle and the Hanging Rocks are similar, though less lofty, rocky pinnacles.

Agriculture.—Of the numerous agricultural products of Virginia, tobacco is most characteristic, although in value it ranks third. It was first grown in the Tidewater district, and later in all sections of the State. Three counties—Pittsylvania, Halifax, and Mecklenburg—produce about one third of the tobacco grown in the State. Corn grows in all sections of the State and is worth more than any other two crops combined. Its value is more than double that of tobacco. The value of the crop of hay and forage also exceeds that of tobacco. Wheat is a staple crop and is the fourth in value. Oats, buckwheat, rye, and barley also grow in large quantities. The cultivation of small fruits and early vegetables is an important interest and brings millions of dollars into the State. These are grown in Accomac County, and in the counties around Norfolk. Peanuts are the leading crop in the Tidewater belt, Norfolk being the

Hammond's 8 x 11 Map of Virginia.
Copyright, 1904, by C.S. Hammond & Co. N.Y.

VIRGINIA

great peanut market of the country. Only a small part of the State is devoted to cotton, and nine tenths of the crop is grown in the counties of Brunswick, Greensville, Southampton, Mecklenburg, and Sussex. The live stock and dairy products of the State are of great value. The live stock sold brings more money to the farmers than the entire tobacco crop, and the value of milk, butter, and cheese produced annually is only a little less than the total value of the tobacco crop. Special attention is given to live stock in the Shenandoah Valley, where blue grass and other fine grasses flourish. Many fine horses are bred in Loudoun and Fauquier counties. The value of the poultry and eggs is nearly equal to the value of the dairy products, and the counties of Rockingham and Shenandoah each report over 1,000,000 dozen eggs sold per year. A large part of the dairy and poultry products are used in the State. In 1900 the principal farm crops were corn, 28,183,760 bushels, valued at \$13,810,042; wheat, 9,421,932 bushels, valued at \$6,783,791; oats, 5,167,568 bushels, valued at \$1,912,000; rye, 370,125 bushels, valued at \$214,672; buckwheat, 58,812 bushels, valued at \$32,347; potatoes, 2,223,778 bushels, valued at \$1,312,029; and hay, 589,133 tons, valued at \$7,835,469. The production of tobacco amounts to nearly 70,000,000 pounds per year, and the annual peanut crop is valued at \$2,500,000.

Fisheries.—Fisheries are important and supply large quantities of fish, which are shipped to other States. Oyster-culture is rapidly increasing. The reports for 1901 showed a gain over 1900 from the oyster planting ground of \$8,192.22, while the increase from tonging was \$1,737.02.

Manufactures.—Although Virginia is an agricultural State, there has been a considerable growth in its manufacturing and mechanical industries since the Civil War. The iron mines, forests, and tobacco and cotton fields of Virginia furnish abundant raw materials for manufactures. Its water power is extensive, and has been developed largely at Fredericksburg and at Petersburg, and more especially at Richmond. The best of steam coal is found in large quantities in the Pocahontas field in the western part of the State, while the Potomac, Rappahannock, James, and York rivers, navigable for 352 miles, together with the 70 miles of sheltered coast line along Chesapeake Bay, afford facilities for the cheap shipment of products to domestic and foreign markets. In 1900 the manufacturers of the State employed 103,670,988 capital and 46,900 persons; paying \$26,291,792 for wages and \$74,851,757 for materials; and having an aggregate output valued at \$132,937,910. The principal manufactures, according to the value of output, were flour and grist (\$12,687,267); lumber and timber (\$12,137,177); chewing and smoking tobacco, and snuff (\$10,707,766); iron and steel (\$88,341,888); railroad cars (\$6,277,279); stemmed tobacco (\$5,726,859); cigars and cigarettes (\$4,843,641); foundry and machine-shop products (\$4,833,137); and leather (\$4,716,920).

Tobacco Industry.—The economic history of colonial Virginia is essentially a record of its tobacco culture. In 1619, 20,000 pounds of tobacco were exported, and in 1642 this staple was made the sole legal-tender currency in the colony. Danville, Lynchburg, and Richmond are

now among the largest tobacco markets in the United States, their combined sales in 1900 amounting to 12 per cent of the production of the country. This abundant supply of raw material naturally caused the development of tobacco manufactures at an early date. At the census of 1810, 2,726,713 pounds of manufactured tobacco and snuff were reported. In 1900 the State ranked fifth in the manufacture of chewing and smoking tobacco. During the decade—1890 to 1900—the value of products in this branch of industry, including snuff, decreased from \$11,804,813 to \$10,707,766. The cigarette manufacture at Richmond began about 1874 and has had a steady growth. The climate is well suited to the handling of the tobacco leaf, and considerable quantities of Connecticut, Pennsylvania, and Havana leaf are brought into the State to be manufactured into cigars.

Forest Products.—In 1900 there were 1,341 establishments engaged in the manufacture of lumber and timber products, the industry being third in rank, with 7,611 wage earners, and products valued at \$12,137,177. In 1890 there were 663 establishments, 5,973 wage-earners, and products valued at \$5,630,600. The increase in the value of products during the decade was \$6,506,577, or 115 per cent. The forests of Virginia early attracted the attention of settlers, and in 1608, the year following the founding of Jamestown, one of the Virginia Company's ships returning to England carried a cargo of iron ore, cedar posts, and walnut boards. Trained workmen were brought from Hamburg and by 1630 sawmills were in operation. In 1900 forests covered 23,400 square miles, or 58 per cent of the land area of the State. Longleaf and loblolly pine constitute about 75 per cent of the standing timber of the State. The mills which saw this timber are located chiefly near Norfolk and along the James River, and in addition to the local supply, use many logs brought by rail and canal from North Carolina. Hard-wood timber products are manufactured chiefly among the oak, ash, and poplar forests in the western and northwestern counties. These forests are being rapidly exhausted.

Transportation.—Steamboats and sailing vessels still furnish means of transportation between points in the tidewater district, but in the interior of the State the canals have been filled up and the stage lines abandoned and almost every section can now be reached by railroad. Besides the railroad lines, steamships ply regularly between the Virginia seaports and the cities of the world. Railroads traverse the State in all directions. The total length of railroads within the State in 1901 was 3,801 miles, of which 70 miles were constructed during the previous year. The leading railroads of the State are the Southern Railway, the Norfolk & Western, the Chesapeake & Ohio, the Atlantic Coast Line, the Seaboard Air Line, the Baltimore & Ohio, and the New York, Philadelphia & Norfolk.

Commerce.—The imports of merchandise at the ports of Alexandria, Newport News, Petersburg, Norfolk and Portsmouth, and Richmond, during the year 1900, aggregated in value \$4,103,696, and the exports \$44,496,713. The excellent harbor at Hampton Roads, with the great commercial cities clustered around it, makes a natural shipping point for a large section of the Mississippi Valley, and a port of

VIRGINIA

entry for goods from foreign countries, while the business enterprise of the commercial houses of the cities of Virginia has built up all over the country an extensive commerce in goods of every character.

Banks and Banking.—In 1901 there were 48 national banks in operation, having \$5,379,660 in capital; \$4,161,515 in outstanding circulation; and \$4,152,000 in United States bonds. There were also 111 State banks with \$6,404,550 capital and \$1,822,463 surplus. The exchanges at the United States clearing houses at Norfolk and Richmond during the year ending 30 Sept. 1901 aggregated \$268,448,810, an increase over those of the preceding year of \$20,854,087.

State Government.—Three of the State officers, the Governor, Lieutenant-Governor, and Attorney-General, are elected by the people. They each serve four years. The election for these officers takes place in November. Other elective State officers are elected by the legislature for two years, except the railroad commissioner and superintendent of public instruction, each for four years. The adjutant-general is appointed by the governor for four years, the commissioner of agriculture and commissioner of labor each for two years. The legislature meets biennially, the first Wednesday in December in odd years. There are 36 senators and 86 members of the House. The State government in 1902 was Democratic. The Governor receives an annual salary of \$5,000. There are 10 representatives in Congress. There are 3,575 post-offices in the State and 250 periodicals. A new State constitution was adopted in 1902.

State Finances.—On 2 March 1901 the State debt was \$24,353,327, divided into Riddleberger Bonds, Act of 1882, \$6,329,554, and Century Bonds, dated 1891, \$18,023,773. The assessed valuation in 1900 was: real estate, \$316,563,279; personal property, \$107,279,401; total, \$423,842,680. The tax rate was \$4.00 per \$1,000. The receipts and disbursements were as follows: Amount on hand, 1900, \$791,321.84; receipts from all sources during the year, \$3,033,150.39; total, \$4,424,478.23. Disbursements, \$3,597,881.17. Balance on hand, 1901, \$826,597.06. The disbursements include \$292,000 turned over to the Commissioners of the Sinking Fund, with which to purchase State Bonds.

Charities and Correction.—There are numerous charitable institutions throughout the State and several hospitals and homes for the aged and for orphans at Richmond. At Staunton is the State School for the Deaf and Blind. In 1901 the net earnings of the State Penitentiary were \$43,053.71. The number of prisoners receiving conditional pardons was 115. The average number of convicts in the penitentiary was 1,199. To feed, clothe, and guard these for the 12 months entailed an expenditure of \$80,707.85. It cost the State \$67.31 to keep each convict in prison for the year.

Education.—The Virginia free school system, established in 1870, is controlled by the State Board of Education, consisting of the Governor, the Attorney-General, the Superintendent of Public Instruction, three members from the faculties of the State institutions for higher education, and one county and one city superintendent of schools. The number of public schools in 1903 was 8,065; number of pupils enrolled, 375,601; average attendance of pupils,

224,769; number of teachers employed, 9,044; cost of public education for the year, \$2,137,361.80. For technical and advanced education and the study of the professions, the State has made provision in its State institutions, as follows: The State University (q.v.), Charlottesville; Virginia Military Institute, Lexington; William and Mary College, Williamsburg; Virginia Polytechnic Institute, Blacksburg; Miller Manual Labor School, Albemarle; Female State Normal School, Farmville. In addition to these, Washington and Lee University (q.v.) is located at Lexington, and colleges founded by the leading religious denominations are located as follows: Randolph-Macon College (q.v.) (for men, at Ashland; for women, at Lynchburg); Hampden-Sidney College, near Farmville; Emory and Henry, at Emory; Richmond College, Richmond (co-educational); Roanoke College, Salem (co-educational). There are law schools at Washington and Lee University, Lexington; at the State University, Charlottesville, and at Richmond College, Richmond. There is a medical department at the State University, and there are also two medical colleges—the Medical College of Virginia and the University College of Medicine—at Richmond. There are theological seminaries for white students at Richmond and Alexandria, and for colored at Richmond, Lynchburg, and Petersburg. For the higher education of colored students are the Hampton Normal and Agricultural Institute, at Hampton, and Virginia Normal and Industrial Institute at Petersburg, supported by the State; and also the Virginia Union University, the Hartshorn Memorial College (female) at Richmond, and the Virginia Theological Seminary and College, at Lynchburg.

Religion.—The strongest denominations in the State are the Regular Baptists (colored); Methodist Episcopal, South; Regular Baptist, South; African Methodist; Presbyterian, South; Protestant Episcopal; Methodist Episcopal; Disciples of Christ; Roman Catholic; Lutheran, General Synod; Primitive Baptists; Dunkard, and Christian. In 1900 there were 4,201 Evangelical Sunday-schools, with 48,531 officers and teachers, and 293,336 scholars.

Population.—In 1790 the population of Virginia was 747,610; (1800) 880,200; (1810) 974,600; (1820) 1,065,116; (1830) 1,211,405; (1850) 1,421,661; (1860) 1,590,318; (1870) 1,225,163; (1880) 1,512,565; (1890) 1,655,980; (1900) 1,854,184. According to sex, nationality, and color, the population is divided as follows: Males, 925,897; females, 928,287; native born, 1,834,723; foreign born, 19,461; whites, 1,192,855; negroes, including all persons of negro descent, 660,722; Chinese, 243; Japanese, 10; Indians, including those taxed and not taxed, 354. According to school and voting age, the division is as follows: Total of school age, 5 to 20 years, 704,771; including 435,612 whites and 268,962 negroes; total of voting age, 447,815, including 436,389 native born, 11,426 foreign born, 301,379 whites, 146,122 negroes, and 113,353 illiterates. The average density of population to the square mile is 46.2. The chief cities are as follows: Richmond (q.v.) (85,050); Norfolk (46,624); Petersburg (21,810); Roanoke (21,405); Newport News (19,635); Lynchburg (18,891); Portsmouth (17,427); Danville (16,520); Alexandria (14,528).

VIRGINIA

Colonial History.—Virginia was the first of the American colonies settled by the English. Jamestown, on the James River, was founded 13 May 1607 by 105 colonists sent out by the London Company, to whom James I. had granted South Virginia, as it was then called in distinction from the territory to the northward, named North Virginia. The colonists were most worthless adventurers; Wingfield, the president of the colony, proved dishonest, and the whole enterprise was only saved from a disastrous end by the courage and energy of Captain John Smith. (See SMITH, JOHN.) In 1609 the London Company was re-organized, and received a grant of territory extending 200 miles north, and the same distance south of Old Point Comfort, and westward to the Pacific. The government council was superseded by a governor to be appointed by the Company's council in England, and to have the sole superintendence of local affairs. Lord Delaware was appointed governor, Sir Thomas Gates lieutenant-governor, Sir George Somers admiral, Christopher Newport vice-admiral, and Sir Thomas Dale, high marshal, all for life. Nine vessels with 500 colonists, including 20 women and children, set sail at once. Gates, Somers, and Newport accompanied the fleet, but the governor was detained for some time in England by his private affairs. The three officers all embarked in the same vessel, and were cast ashore on one of the Bermudas; one of the other vessels was lost, but the remaining seven arrived in safety in the James River. The old government was abrogated, but none of the officers of the new one having arrived, Smith retained the government, as the charter authorized him to do, but the new colonists, like the old, were mostly a profligate set of adventurers, whose whole study seemed to be to create disturbances. Smith was soon after severely wounded by an accident and obliged to return to England for surgical aid, and left a colony of 500 persons well supplied with arms, provisions, and goods for traffic with the Indians, and provided with a fort, church, storehouse, and 60 dwellings, and a good stock of domestic animals. After his departure the colonists gave themselves up to riot and idleness, and a party of 30 seized a vessel belonging to the colony and sailed away as pirates. Six months after Smith's departure only 60 colonists remained. At this juncture Newport, Gates, and Somers, with 150 men, arrived from the Bermudas in vessels which they had built there. Finding the condition of things at Jamestown, they resolved to abandon Virginia and sail with the remnant of the colonists to Newfoundland to seek food and a passage home from the fishermen. As they descended the river (10 June 1610) they met Lord Delaware, who had just arrived from England, bringing supplies and colonists. He persuaded them to return to Jamestown, took measures for procuring supplies, established a trading post at Hampton at the entrance to James River, and punished the Indians for their barbarities toward the colonists by attacking and burning several of their villages. His health failing, he returned to England, leaving Captain Percy as his deputy. He was soon superseded by Sir Thomas Dale, who arrived with 300 settlers and some cattle; and the latter, in August 1611, by Sir Thomas Gates, who brought 350 more colonists.

New settlements were commenced at Henrico, some distance above Jamestown, and at the junction of the Appomattox and the James, then called New Bermuda. The laws made for the colony were harsh and strict, and occasioned much dissatisfaction. In 1616 Dale, who had resumed the government of the colony at the departure of Gates, returned to England, and soon after Captain Argall was appointed deputy-governor. He used his office so much to the distress of the colonists that Lord Delaware sailed from England to resume his duties, but died on his passage, at the mouth of the bay which bears his name. George Yeardley was now appointed governor (1619) and knighted. Twelve hundred colonists were sent over during this year, among whom were 90 respectable young women, who were disposed of to the planters as wives at the cost of their passage. Among the new colonists were 100 sent by the king's special order from the prisons, to be sold as servants to the planters. This was the first instance in which felons had been sent to a British colony, and despite the protests of the colonists they continued to be sent in increasing numbers to Virginia for 100 years. In 1619 a Dutch trading vessel brought to Jamestown 20 negroes, who were sold as slaves for life. The number did not much increase for the next 40 years, being limited to a few cargoes brought in by Dutch traders. More settlers arriving, new plantations were established on the York, James and Potomac rivers, and on the eastern shore of the Chesapeake Bay.

In 1622 occurred a bloody war between the colonists and the Indian tribes led by Opechancanough, the brother and successor of Powhatan. On the night of 22 March 350 persons were massacred, and in a brief period Indian murders, sickness and famine reduced the number of the colonists from 4,000 to 2,500. In 1624 the London Company was dissolved and the colony passed under the direct charge of the crown, except during the period of the Commonwealth, 1649-1660. Its condition at this time was not prosperous, tobacco being the only article of export which paid a profit. In 1630 a fort was built at Point Comfort, and salt works were established at Accomac. In 1632 the laws of the colony were revised and consolidated, and, though occasionally troubled by the Indians, and by vicious and vagabond colonists, it seems to have maintained a fair share of prosperity for a number of years. In 1641 Sir William Berkeley became governor, and being a staunch loyalist soon came into collision with the parliament. The colony remained firm in its adherence to the Stuarts till March 1652, when an English fleet which had been sent to Barbados to reduce that island to submission visited the Chesapeake, and arranged terms of capitulation with the loyalists; and Berkeley's commission being declared void, Richard Bennet, a Puritan settler in Maryland, was elected governor. On the restoration of Charles II., Sir William Berkeley returned and was elected governor. The right of suffrage, which had been almost universal during the protectorate, was limited by act of 1670 to freeholders and householders, not so much from the pressure of the royal authority as from the aristocratic views of the prominent planters. The code of the colony was again revised in 1662, and the Church of England re-established, and severe laws were passed against "noncon-

VIRGINIA

formists, Quakers, and Anabaptists." The rapacity of the courtiers of Charles II., upon two of whom, Arlington and Culpeper, he had bestowed a patent of the Virginia colony, and the heavy taxation encouraged for his own purposes by Sir William Berkeley, led to great discontent, which in 1676, on the occasion of a levy of fresh taxes to provide against a threatened attack from the Indians, culminated in what is known as "Bacon's rebellion." (See BACON, NATHANIEL.) Berkeley met with large pecuniary losses in this rebellion, and when it was fairly quelled he was so relentless in his vengeance on all who had participated in it as to bring down upon himself the royal displeasure. In the winter of 1677 he visited England to justify his conduct, but died before having an interview with the king. Lord Culpeper was then governor for a time, and was followed by Lord Howard of Effingham, both rapacious and greedy. In 1689 the colonial government reluctantly proclaimed William and Mary. In 1705 the fifth colonial revision of the code took place. By it the slave was declared real estate, and thus, like the Russian serf, attached to the soil. This provision remained in force while Virginia continued a colony. In 1698 Williamsburg, founded and named in honor of William III., became the capital of the colony. In 1754 hostilities broke out with the French, who had built a line of military posts along the western slope of the Alleghenies and at the head waters of the Ohio; and in this war George Washington first entered the service of his country, commanding the colonial troops at the battle of Fort Necessity (1754), and being placed at the head of the Virginia forces after Braddock's defeat in 1755. The assertion by parliament in 1764 of the right to tax the colonies without their consent called forth an earnest petition, memorial and remonstrance from the Virginia house of burgesses in December of that year; and the stamp, mutiny, and quartering acts passed by parliament in 1765 led to the adoption of resolutions denying the right of any foreign body to levy taxes upon the colony.

In the first colonial congress, which met in New York 7 Oct. 1765, Virginia was not represented, her legislature having adjourned before the issuing of the Massachusetts circular; but its action was approved at the next session of the legislature. The passing of Townshend's measures of indirect taxation by parliament produced a remonstrance on the part of the Virginia legislature, and a renewed assertion of their exclusive right of self-taxation, and of trial by a jury of the vicinage. The name of Thomas Jefferson appears for the first time in connection with these resolutions, which were passed 16 May 1769. Lord Botetourt, the royal governor, at once dissolved the assembly, but its members in their private capacity met and entered into a non-importation agreement, which was very generally signed by the merchants and planters of the colony. The commerce of Virginia with Great Britain was at this time larger than that of any other colony. In March 1773 the house of burgesses, under the zealous advocacy of Patrick Henry, Jefferson, and R. H. Lee, appointed a committee "to obtain the most clear and authentic intelligence of all such acts of the parliament or ministry as might affect the rights of the colonies"; and the same committee were authorized to open a correspondence and

communication with the other colonies. On the passing of these resolutions Lord Dunmore, the newly appointed governor, dissolved the assembly. In the autumn of 1774 a conflict occurred between the Indians under Logan, Cornstalk, and other chiefs, and a Virginia force of about 1,200 men, at Point Pleasant, on the Ohio River. The Indians were defeated, but the Virginians had 60 or 70 killed, and a large number wounded. The Virginia convention which met at Richmond 20 March 1775, to appoint delegates to the new continental congress, took measures for enrolling companies of volunteers in each county. On 21 April Governor Dunmore ordered the powder belonging to the province to be taken from the public store at Williamsburg and placed on board an armed vessel in the river. Learning this, Patrick Henry collected some companies of volunteers, marched upon Williamsburg, and compelled the king's receiver to give bills for the value of the powder taken away. On 23 November Lord Dunmore with a British and Tory force took possession of Norfolk. He was driven from it 3 December, but, in January 1776, returned with a larger force and bombarded it. He continued a predatory warfare along the whole Virginia coast through the ensuing summer, but was finally driven southward. The Declaration of Independence was proposed in the Continental Congress by the Virginia delegates under instructions from the convention of the colony. In the summer of 1779 the British General Matthews made a descent upon the coast, destroyed Norfolk, took Portsmouth and Gosport, destroying the vessels of war building there, and burned or took 130 merchant vessels on the James and Elizabeth rivers. In January 1781 General Benedict Arnold captured and burned Richmond, then a village of 1,800 inhabitants; but being pressed by the militia under General Steuben and some French frigates in the Chesapeake, he was forced to escape with a few prizes to Newport, R. I. In the spring and early summer of the same year Cornwallis and Phillips plundered the greater part of eastern Virginia, seizing and destroying property to the value of not less than \$10,000,000. The surrender of Cornwallis at Yorktown on 19 Oct. 1781 virtually closed the war.

State History.—Virginia had been the first to urged the organization of a confederacy of States; and when it became evident that this confederation was inadequate for the purposes of a national government, she was again the first to call a convention of the States in September 1786, to arrange for some additional compacts relative to a tariff, navigation, etc. This convention, delegates being in attendance only from five States, did not venture to take action, but recommended the call of a convention in the following May to consider the articles of confederation, and propose such changes therein as might render them adequate to the exigencies of the Union. The constitution framed by that convention was ratified by Virginia 25 June 1788. There was a strong opposition to giving it her sanction, led by George Mason and sustained by Patrick Henry, and the vote was accompanied by a proposition for more than 20 alterations in the constitution. In 1784 Virginia had ceded to the United States her claims to lands northwest of the Ohio, founded on the grant in the charter to the London Company in

VIRGINIA

1619, reserving to herself her lands south of the Ohio, and bounty lands northwest of that river for her revolutionary soldiers and those employed in the expedition for the conquest of Kaskaskia and Vincennes, and stipulating in her act of cession for indemnity for the expenses of that expedition, for the security of the French inhabitants of those settlements, and that the ceded lands should be erected into republican States not exceeding certain specified dimensions. For many years after the adoption of the Federal Constitution, Virginia maintained a predominant influence in the affairs of the nation; of the first five Presidents, four were natives and residents of that State, and each of them was re-elected for a second term; and since that period three other natives of the State, one of them at the time of his incumbency a resident of it, have filled that high office.

At the time of the secession of the southern States, at the close of 1860 and commencement of 1861, a majority of the people of Virginia were strongly attached to the Union, but they also sympathized with the seceding States. At an extra session the legislature called a State convention, the members of which were to be elected 4 Feb. 1861. A bill was passed 23 January, appropriating \$1,000,000 for the defense of the State. The governor meantime sent several messages to the legislature, all of them exhibiting great hostility to the northern States, and 10 of the Virginia members of Congress published an address to the people of the State, denouncing the Republican party in Congress, and declaring that "it was vain to hope for any measures of conciliation and adjustment from Congress which the people of Virginia could accept." The number of delegates elected to the state convention was 152, of whom the greater part were "conditional" Union men, a few in favor of immediate secession, and about as many unconditional Unionists. The convention met at Richmond, 13 February, and on 10 March the committee on Federal relations submitted several reports. The majority report, composed of 14 resolutions, avowed the doctrine of state rights, condemned all interference with slavery as dangerous, asserted the right of secession, and defined the circumstances under which Virginia would be justified in exercising that right, viz., the failure to procure such guaranties from the northern States as she demanded, the adoption of a warlike policy by the general government, or the attempt to exact payment of duties from the seceded States, or to reinforce or recapture the forts. The majority resolutions were discussed and adopted as far as the 13th, when the capture of Fort Sumter by the southern forces, and the consequent proclamation of the President calling for troops, led to the passing on 17 April of an ordinance of secession by a vote of 88 yeas to 55 nays. Twelve of those voting nay were not long after expelled from the convention. The people of the State had by a majority of 52,857 required that the action of the convention should be submitted to their decision, and a vote on the ordinance of secession was accordingly ordered to take place on the fourth Thursday of May. The State government, however, acted as if the ordinance had already been ratified by the people. The Federal flags were removed, troops to the number of 10,000 were called out by the governor,

and loans effected for their arming and equipment; and on 25 April the convention passed an act for the adoption of the constitution of the provisional government of the Confederate States of America. The State convention on 29 April appointed delegates to the Confederate congress and invited that congress to make Richmond the seat of government of the Southern Confederacy; an invitation which was accepted soon afterward. It also authorized the banks to suspend specie payments, established a navy for Virginia, provided for enlistments in the State army, and then adjourned to 15 June. On 13 May delegates from 25 counties met at Wheeling, and adopted resolutions condemning the ordinance of secession, and providing for a convention to represent all the counties in the State favorable to the division thereof, to be held at Wheeling, provided the ordinance of secession was ratified against the vote of western Virginia. The popular vote was taken as provided in the ordinance 23 May and resulted in a majority of 94,000 in favor of the secession ordinance. Eastern Virginia voted almost unanimously for it, while the western counties were as unanimous against it. The convention of western Virginia, representing about 40 counties, met at Wheeling on 11 June, passed a declaration of independence from the action of the State convention, declared vacant the offices held by all State officers acting in hostility to the Federal government, and took measures for the establishment of a provisional government. The proposition for a division of the State was voted down in the senate, 20 to 17. Subsequently, however, the convention at an adjourned session passed an ordinance organizing the western counties into a new State to be called Kanawha. The provisional legislature of the State of Virginia in session at Wheeling gave its sanction to the setting off of the new State, and on 24 October the act was approved by the people of the 39 counties by an almost unanimous vote. The new State (its name having been changed to West Virginia) applied for admission into the Union at the first regular session of the 37th Congress, but the subject was postponed to December 1862.

Meanwhile Virginia was the centre of the war zone in the East and became the scene of some of the most important battles of the Civil War (q.v.), among them being the two battles of Bull Run, Winchester, Fredericksburg, Chancellorsville, the Peninsular campaign, and the battles of the Wilderness campaign. Virginia troops throughout the conflict played a valuable part. The military operations in Virginia were distinguished by desperate fighting, and this is particularly true of the warfare north of the Rappahannock. Richmond was the strategic capital of the Confederacy. The Federal forces came to occupy the greater part of the State; and the customary effects of war were seen in the desolation of the country. Every section was invaded, and at the time of the surrender at Appomattox Court House (9 April 1865). Confederate army and civilians were threatened with famine. General Lee, commander-in-chief of the military forces of the Confederate States, and "Stonewall" Jackson, and J. E. Johnston, commanders of Confederate armies, were all Virginians.

The Civil War was the last notable event in connection with the history of Virginia. Since

VIRGINIA — VIRGINIA CONVENTIONS OF THE REVOLUTION

that time there have been numerous political difficulties. The Reconstruction acts granted to negroes the right of voting for delegates to a State convention. In 1868 a new constitution was adopted. Among various new features therein embodied was that of negro suffrage. There was much dislike of the new instrument, which was not submitted to popular vote until July 1869, when it was adopted by a large majority, though the clause disfranchising Confederate officials and demanding an oath of past loyalty, was rejected. G. C. Walker was elected governor; United States Senators were also chosen, the 14th and 15th amendments were ratified, and the military occupation, never required, was brought to an end. On 26 Jan. 1870, Virginia was readmitted to the Union. There was soon trouble in connection with legislation respecting the State debt. By a bill passed in 1871, two thirds of the debt of Virginia was funded into bonds, the coupons of said bonds to be held receivable in payment for taxes assessed. The remaining one third was held to be the suitable share of West Virginia, though the latter State refused to admit such obligation. In 1872 the Virginia State legislature repealed the tax-coupon arrangement of the law; but the courts decided that the State was under obligation to receive the bonds, even should the treasury be thereby kept bankrupt. At that time \$17,000,000 in these bonds had been funded. Attempts toward a compromise were made, and conflicts between Federal and State courts were frequent. In 1891-2 a settlement was finally arrived at. The bondholders received for bonds and coupons amounting to \$23,000,000, the sum of \$19,000,000 in new century bonds. During the period of discussion regarding the State debt, politics was much affected by the question; a "Readjuster" party was formed, finally absorbed by the Republican, and elections were based on the matter. The negro vote was divided. A constitutional convention, held in 1901-2, had as its chief objects in view the restriction of the suffrage and financial retrenchment. The new constitution was proclaimed 19 May 1902, but was not submitted to popular vote. Virginia has been throughout almost steadily Democratic in Federal politics. In 1860 it voted for John Bell, the Constitutional Union nominee, and in 1872 for Grant; but otherwise it has consistently supported the Democratic national candidates. In 1881 the 100th anniversary of the surrender of Lord Cornwallis to Washington at Yorktown was celebrated by the laying there of the corner-stone of a national memorial (18 October). At the time of the Spanish-American war, in 1898, an extensive military camp, Camp Alger, was established and maintained near Falls Church, Fairfax County.

Bibliography.—Books on Virginia history by Howison (1846-48), Campbell (1860), Stith (1866), Cooke (1883), O'Neill (1885), Drake (1894), Bruce (1896); Howe, 'Virginia Historical Collections' (1845); Keith, 'History of British Plantations in America' (1737); Hale, 'Transatlantic Pioneers' (1886); Wingfield, 'A Discourse of Virginia' (1860); Kercheval, 'A History of the Valley of Virginia' (1850); Jefferson, 'Notes on the State of Virginia' (1787); Forrest, 'Norfolk and Vicinity' (1853); Foote, 'Sketches of Virginia' (1855); Jones, 'Army of Northern Virginia' (1880); Boyd, 'Resources

of Southwest Virginia' (1881); Waddell, 'Annals of Augusta Co., Va.' (1888); Pearson, 'Household Scenes in the Old Dominion' (1853); 'Virginia Magazine of History and Biography'; books on the Civil War and Virginia State Reports.

Virginia, Ill., city, county-seat of Cass County; on the Chicago, P. & St. L. and the Baltimore & O. S. R.R.'s; about 30 miles west by north of Springfield. It is in a rich farming section. The chief industries are connected with farming and dairying. The city has a high school, elementary schools, and the library of the Central Illinois Science Society. There are two national banks and one state bank having a combined capital of \$160,000 and deposits amounting to \$388,960. Pop. (1890) 1,602; (1900) 1,600.

Virginia City, Nev., city, county-seat of Storey County; on the Virginia & Truckee Railroad; about 200 miles northeast of San Francisco and 14 miles northeast of Gunnison. It is on the eastern side of Mount Davidson, about 7,825 feet above the level of the sea. It was settled in 1859, when the famous Comstock Lode was discovered, and chartered as a city in 1864. Mines under the city have produced nearly \$400,000,000 in gold and silver bullion. There is still considerable silver mining in the vicinity. The city has a daily supply of 10,000,000 gallons of water for use for domestic and mining purposes, brought from the Sierra Nevada Mountains, 30 miles west, at a cost of \$2,500,000. The principal mines are drained by the Sutro tunnel (4 miles long, cost \$4,500,000) at a depth of 1,650 feet. The deepest mining works have a depth of 3,000 to 3,300 feet. Numerous great mining plants have been erected in the city at a cost of from \$350,000 to \$1,000,000 each. The city has gas and electric light plants and a weekly and two daily newspapers. The Miners' Union Library, the court-house, churches, and schools are the principal buildings. Pop. (1880) 10,917; (1890) 8,511; (1900) 2,695. The decrease in population is mainly due to the decline in the price of silver.

Virginia Conventions of the Revolution, The. The change from colony to commonwealth in Virginia was made by means of five conventions, called together between 1774 and 1776. These conventions are important not only as marking the transition of this ancient colony to statehood, but also because they greatly influenced the course of continental or national affairs. For example, they had to do with the summoning of the First Continental Congress, and with the appointment of delegates thereto so decisive as Peyton Randolph (its first President), George Washington, and Patrick Henry. The constitutional principles formulated by these conventions, especially by the one in 1776, which drafted the Virginia Constitution, were later built into the federal structure.

First Convention (1 Aug. 1774).—The circumstances which led to the calling of the first Virginia convention were as follows: During the session of the House of Burgesses, as the popular branch of the colonial legislature was called, news arrived from Boston of the decision upon the part of the British ministry to close

VIRGINIA CONVENTIONS OF THE REVOLUTION

that port as a punishment for the destruction of the famous tea. The indignation felt upon every hand in Virginia headed up in a resolution, passed on Tuesday, 24 May, to appoint the first day of June as a day of fasting and prayer to God to avert this doom from Boston. As soon as this action of the legislature became known to the royal governor, Lord Dunmore, he in high dudgeon dissolved the House of Burgesses. The following Sunday afternoon, when only a score or so of the late burgesses remained in the sleepy little capital of Williamsburg, a messenger arrived from Boston, bringing a circular letter, appealing to the colonies for united support, and advocating the cessation of all trade with Great Britain. The responsibility for a final answer to this appeal from Boston was too grave for the Committee of Correspondence at Williamsburg to assume alone. After consultation, it was decided the next morning at a meeting of the 25 burgesses remaining in town, to ask the counties to appoint deputies to a convention, which should consider the question of the cessation of all trade relations with Britain, and should select delegates to the proposed Continental Congress. The time named for this convention was 1 August, and the place Williamsburg. This summons, the original of which is in the Virginia State Library, was evidently written by Peyton Randolph, the moderator, whose name stands first in the list of signers. Then follow the names of Thomas Jefferson, George Washington, Henry Lee, etc. This call for a Virginia Convention has the same significance in the progress of the Virginia Revolution as the meeting of the *Tiers-Etat* in the Versailles Tennis Court, 15 years later, in the French Revolution. It was in both instances an assertion of the sovereignty of the people over against the prerogative of the crown. Sympathy for Boston in its sufferings had called forth in Virginia the representatives of the sovereign people, whom royal writs did not summon nor royal governors dissolve. The first Virginia Convention met in Williamsburg, on 1 Aug. 1774, and remained in session six days. Fifty-six counties and four boroughs were represented; the counties by two delegates each and the boroughs by one each. Peyton Randolph, the former speaker of the House of Burgesses, was made president. Delegates were chosen to represent Virginia in a General Congress, namely Peyton Randolph, George Washington, Richard Bland, Benjamin Harrison, and Edmund Pendleton. In support of Boston, it was agreed to buy no goods, except medicines, from Great Britain, after 1 November; and neither to import slaves nor purchase slaves imported, after that date, from any place whatsoever. The delegates further declared that unless American grievances were redressed by 10 Aug. 1775, they would stop all exports of their produce to Britain. Provision was made for future sessions of the convention, should the condition of the country demand. This meeting was also the means of making known to the public Thomas Jefferson's paper, afterward entitled, "A Summary View of the Rights of British America," a forerunner of the Declaration of Independence. For the proceedings of this convention, consult the files of the 'Virginia Gazette,' 4-11 Aug. 1774.

Second Convention (30 March 1775).—The second Virginia convention was held at Richmond, 20 to 27 March 1775. It sat in Saint John's Church, which crowns an eminence overlooking the valley of the James. The historic church is still (1904) used as a house of worship, the spot being indicated where Patrick Henry stood as he made his famous speech in favor of arming the colony. The members were grouped into two parties, the one conservative, deprecating radical measures and relying still upon reconciliation with Great Britain; the other aggressive, believing that pacific means had been exhausted, and urging that the colony be armed. Peyton Randolph, the president, was the leader of the former group. Patrick Henry was the mouthpiece of the latter. For three days neither party committed itself. But upon the fourth day a resolution was adopted, thanking the Assembly of Jamaica for its memorial to the king in behalf of the American colonies, and expressing an ardent desire for peace. This seemed to Patrick Henry to savor of servility. He thereupon brought forward his famous resolution for putting the colony in a posture of defense, asserting that "a well-regulated militia, composed of gentlemen and yeomen, is the natural strength and security of a free government." Despite opposition, this resolution was carried, chiefly by the passionate eloquence of Henry, and the military resources of the colony were at once directed to be organized and made efficient. The convention appealed to the people for contributions for the relief of the inhabitants of Boston, "suffering in the common cause of American freedom." The former delegates to Congress were re-elected, Thomas Jefferson being made alternate for Peyton Randolph, in case the latter could not attend. The people were asked to choose delegates to represent them in convention for one year.

Third Convention (17 July 1775).—Meantime, events moved rapidly. The battles of Lexington and Bunker Hill, the session of the Second Congress at Philadelphia, Lord Dunmore's seizure of the powder in the magazine at Williamsburg, and his subsequent escape to a British man-of-war lying at Yorktown, had wrought the mind of the patriots to a high state of excitement. The governor threatened the colony with fire and sword. Such were the circumstances under which the third convention met at Richmond, on 17 July 1775. Some changes of consequence had occurred in the membership of the body. Fifteen days before the planters came together at Richmond, George Washington had taken command, under the old elm at Cambridge, of the American army. His place as a delegate was taken by his neighbor, George Mason, whose mind for the next year was to be engaged in the constructive work of the Virginia commonwealth. For nearly a month, the convention suffered more or less distraction, owing to the absence in Congress of such experienced leaders as Henry, Jefferson, and R. H. Lee. The legal status and methods of this body differed materially from those of the previous conventions. Both the outward circumstances of the colony and the inner movement of thought strengthened the hands of the delegates and forced the convention to assume responsibilities undreamt of by the score of ex-burgesses who had suggested the calling of the first convention.

VIRGINIA CONVENTIONS OF THE REVOLUTION

Lord Dunmore had fled. The royal government was dissolved. The convention was driven to meet this new turn in affairs. No longer content with resolutions, it followed legislative methods and gave to its acts the forms of law, terming them ordinances. One hundred and fifteen delegates were present. The leading measures acted upon by this convention were, to organize the military forces for the defense of the colony, to create an executive organ to act during the recess of the convention, to provide adequate revenue for the provisional government and army of the colony, to establish executive county committees, to regulate the election of delegates to the convention, and to elect new representatives to Congress. As the bare enumeration shows, these were tasks of no little difficulty. Interest attaches to the slip of paper (in the Virginia State Library) upon which the tellers made their report of the ballots for representatives for Congress: "Peyton Randolph 80, Richard Henry Lee 88, Thos. Jefferson 85, Benj. Harrison 83, Thos. Nelson 66, Richard Bland 61, George Wythe 58," etc. A representative in Congress "shall be allowed for every day he may attend therein the sum of 45 shillings," which sum was reduced by the convention the following year to 30 shillings per day, to be paid by the treasurer of the colony. The Committee of Correspondence was converted into the Committee of Safety, which directed, during the recess of the convention, both the military and civil affairs of the nascent State. On 17 Aug. 1775, the first Committee of Safety, consisting of 11, was elected, the tellers on this occasion being Richard Henry Lee, Thomas Jefferson, Benjamin Harrison, and Patrick Henry. The convention adjourned 26 Aug. 1775.

Fourth Convention (1 Dec. 1775).—The fourth convention met at Richmond 1 Dec. 1775, but, after organizing, removed to Williamsburg. As Peyton Randolph, who had signally served as speaker of the House of Burgesses, president of three previous Virginia conventions and president of the first two congresses, had died in Philadelphia on 22 Oct. 1775, Edmund Pendleton was chosen president in his place. The chief measures that engaged the attention of this convention were the increase of the army for the defense of the colony (nine regiments, enlisted for two years) against the Tory forces commanded by Lord Dunmore, who held Norfolk and the adjacent region; the establishment of an admiralty court; the appointment of a commission of five men in each county to try the causes of those deemed "enemies of America"; the authorization of the county courts to elect severally a sheriff for one year; and instructions to the Virginia delegates in Congress to urge the opening of the ports of the colonies to the commerce of the world, excepting Great Britain and the British West Indies. The Virginia troops were merged into the continental army, and the superior officers were hereafter commissioned by Congress. The convention adjourned 20 Jan. 1776. While this convention was in session, the Virginia troops routed the forces of Lord Dunmore at Great Bridge 9 Dec. 1775. On 1 Jan. 1776, Dunmore burned Norfolk, the chief town in Virginia, having about 6,000 inhabitants, and continued to ravage the coasts until summer. Being dislodged from Gwynn's island in

Chesapeake Bay by Andrew Lewis, he fled to New York and thence to England.

Fifth Convention (6 May 1776).—The growth of the idea of American independence was slow in the Old Dominion. The burning of Norfolk on 1 January, and the successes of Washington in the early spring in ousting the British from Boston, precipitated opinion in Virginia. The election of delegates to the May convention took place during April, and the two points which constantly recur in the instructions given them are independence and representative government. For instance, the freeholders of Charlotte County, on 23 April 1776, said to their representatives: "We give it in charge to you to use your best endeavors that the delegates which are sent to the General Congress be instructed immediately to cast off the British yoke." The fifth convention met on 6 May 1776, at Williamsburg, 66 counties and corporations being represented by 131 delegates. Twenty-nine of these were new members, whose selection is perhaps attributable to the increase of religious dissent in the colony. Among the new members were James Madison, recently from Princeton College, and Edmund Randolph, son of the king's late attorney-general, who had taken ship with Lord Dunmore for England. George Mason, owing to sickness, did not take his seat until 18 May, bringing perhaps in his pocket both a declaration of rights and a draft of a constitution for the anticipated commonwealth. The convention was at once a legislative, constituent, and executive body. The three great measures of constructive policy which it formulated were: First, the instructions to the Virginia delegates in Congress to propose independence; second, the bill of rights; and third, the constitution of Virginia. Its session lasted 51 days, a brief space, considering the novel and momentous task of organizing a commonwealth. Edmund Randolph tells us that the resolution instructing the delegates in Congress to propose the declaration that "the United States are free and independent States" was "drawn by Mr. Pendleton, proposed by General Nelson, and enforced by Mr. Henry." The first drafts of the motion for independence in the convention were found some years ago in the Virginia State Library, by William Wirt Henry, and may be seen in his 'Life of Patrick Henry.' They were endorsed by the clerk, "Rough Resolutions, Independence." After the passage on 15 May 1776, of the resolution instructing the delegates in Congress to propose independence of Britain, the British flag was at once struck on the capitol at Williamsburg, and the colonial colors hoisted in its stead. At night, the town was illuminated, and the people were jubilant. On 27 May, Archibald Cary presented to the convention the "Declaration of Rights," which had been originally drawn by George Mason. In it the well-known guarantees of personal liberty are admirably stated. It was in the discussion of the articles in this "Declaration" bearing upon religious toleration, that James Madison came forward for the first time, emphasizing the distinction between religious liberty and toleration, and contending boldly for an expression of outright religious liberty. In consequence, the convention declared in the 16th article, that "all men are entitled to the free exercise of religion, according to the dictates of conscience." The "Declaration" thus

VIRGINIA CREEPER — VIRGINIA POLYTECHNIC INSTITUTE

framed has been the Magna Charta of Virginia, forming an integral part of every constitution since that day. It is the bed-rock of republican government. The original draft of the "Declaration of Rights," in Mason's own handwriting, was presented to the State of Virginia, 15 Feb. 1844, by General John Mason, the last surviving son of George Mason of Gunton Hall. This copy now hangs on the wall of the Virginia State Library. Seven different schemes of government are known to have been before the convention. From these was evolved the first constitution, which was finally adopted on 29 June 1776 — the natal day of the commonwealth of Virginia. This constitution provided for a bicameral legislature, called the house of delegates and senate, elected by freeholders. The executive was to be a governor, elected annually by the house and senate on joint ballot. He was to be assisted by a privy council, consisting of eight members chosen by the legislature. The judges of the supreme court of appeals, judges of admiralty, and attorney-general, were elected also by the legislature, and continued in office during good behavior. All laws were to originate in the house of delegates, but were, except money bills, amendable by the senate. The convention immediately elected Patrick Henry as governor and Edmund Randolph as attorney-general. The new government went into operation at once. After making provision for an increase of troops and for the vigorous prosecution of the war, the convention adjourned on 5 July 1776. The commonwealth of Virginia was thus launched upon its historic development. See UNITED STATES — FORMATION OF STATE CONSTITUTIONS.

S. C. MITCHELL,
Professor of History, Richmond College.

Virginia Creeper, a very ornamental American climbing shrub (*Parthenocissus*, or *Ampelopsis, quinquefolia*). It is frequently confounded with poison-ivy, and the two plants often grow together; but it should be remembered that the innoxious creeper is distinguished by its leaves, which are not shining, and are palmately parted into five divisions, whereas the poison-ivy's leaves have but three leaflets and are glossy. The small, white five-merous flowers, with spreading petals, are in ample panicles, but are not so conspicuous as the fruit, which consists of dark-blue berries, on red pedicels. They are ripe in autumn, and are set off by the rich tones of crimson which the foliage assumes at that season. The Virginia creeper, or American ivy, or woodbine, as it is variously styled, is one of our most decorative vines. It travels over rocks and fences, sending out delicate trailing branches, with the leaves regularly diminishing in size down to the folded ones near the curving tip. They soon start climbing by numerous tendrils, which are often tipped with disk-like enlargements, and that adhere to rough surfaces of walls or trees, and are further supported by aerial roots, springing from the stems. Compare POISON-PLANTS.

Virginia Deer, Quail, etc. See DEER, QUAIL, etc.

Virginia Exposition. See JAMESTOWN, Va.

Virginia Military Institute, a State school located at Lexington, Va. It was established in 1839 by act of the legislature, and opened to students in the same year. It is governed by a

board of visitors consisting of the superintendent of public instruction, and the adjutant-general, members *ex officio*, and nine other members appointed from different sections of the State by the governor with the approval of the senate. In accordance with the laws of Virginia the professors and officers hold commissions in the State militia, and the students are organized as a military corps of cadets. The school played an important part during the Civil War; in April 1861 the cadets were ordered to Richmond, where they took part in drilling volunteers; in 1862 the Institute was reopened; and in May 1864 the cadet corps was ordered out for active service and took a leading part in the battle of New Market, Va. During the war the cadets were in active service 13 months. In June 1864 the buildings and equipment were burned by the Federal army; in October 1865 the Institute was reopened, the buildings and equipment rapidly restored, and the course of instruction greatly improved and extended. The regular course covers four years, and though largely scientific and technical, includes some general culture subjects. The work of the first two years is the same for all, and includes English, a foreign language, science, mathematics and drawing, some of the courses being elective; at the end of the second year students may elect between courses in civil engineering, applied chemistry, and electricity; the degree of B. S. is conferred for the completion of any of these courses. There is also post-graduate work offered leading to the degrees of C. E. or M. S. For military instruction and drill the cadets are organized in a battalion of four companies; the discipline is strict, the regulations being based on those of West Point. Instruction is given in infantry and artillery tactics, ordnance and gunnery, military science and the art of war, and military engineering. A certain number of cadets, not less than 50, are admitted each year as State cadets, without charge for tuition or board. The Institute is located outside the city on a hill overlooking Wood's Creek; the new Academic Building was completed in 1900. In 1904 the library contained 12,509 volumes, the students numbered 286 and the faculty and military staff 27. Since the foundation of the school in 1839 there have been 5,361 matriculates, of whom 1,892 became full graduates.

JOS. R. ANDERSON,
President Virginia Military Institute.

Virginia Polytechnic Institute, The, located at Blacksburg, Montgomery County, Va. It was established as the Virginia Agricultural and Mechanical College by the State of Virginia in 1872, in accordance with the provisions of the land grant act of 1862. (See COLLEGES, LAND GRANT.) In the same year it was opened to students. Its name was changed by authority of the legislature in 1896 to Virginia Polytechnic Institute. It is under the control of a board of visitors, consisting of the superintendent of public instruction of the State, the president of the State board of agriculture and immigration, *ex-officio* members, and eight members appointed by the governor with the approval of the Senate. One half of the eight members are appointed every two years for terms of four years. The institute offers eight courses of four years, each leading to the degree of B.S., and two short courses each in practical mechanics and agriculture. Graduate

VIRGINIA RESOLUTIONS—VIRGINIA, UNIVERSITY OF

work is also offered looking to the degrees of M.S., C.E., M.E., and E.E. The B.S. courses are agriculture, horticulture, applied chemistry, a course preparatory for medicine or veterinary science, a course in general science, and courses in civil, electrical and mechanical engineering. Each course includes some general culture studies, while in all of the degree courses English, the modern languages, mathematics, history and political science are required. Laboratory practice or practical work in shop or field forms a part of each course and consumes about one half of the number of hours. It is readily seen then that, while the institute is a technical school, the endeavor is to give well-rounded courses. In addition to the practical work required, students are given the opportunity to pay a part of their expenses by manual labor. Instruction in military science and drill are required of all students. The battalion of cadets consists of six infantry companies, one battery of light artillery, a signal corps, a drum corps, the staff, and band. The State Agricultural Experiment Station is a department of the institute, under the control of its board of visitors. The president of the institute is also, by virtue of his office as president, the director of the station. Under the guidance and by the aid of the institute authorities farmers' institutes are organized and conducted in various portions of the State. The students maintain two literary societies, each of which occupies a well furnished hall. The institute is situated on the crest of the Alleghenies, at an elevation of more than 2,000 feet. The campus contains 90 acres, the farm 400 acres. In addition the institute has leased for a term of years 750 acres of land lying contiguous to its farm. The plant consists of more than 50 buildings, including the shops and farm buildings. The Science Hall, a new dormitory, and an infirmary, completely equipped with all modern conveniences, were added in 1903. There are now (1904) in process of construction a number of handsome buildings, including a dormitory, a chapel and an auditorium, an engineering and an agricultural hall. The income is derived in a large measure from the land grant fund of 1862, and the national appropriation in accordance with the law of 1890. In recent years the State has also shown its wisdom by adopting a generous attitude toward the institution. In 1904 the income amounted to \$83,390. Of this amount \$36,640 was from the national government and \$46,750 from the State. The faculty of the institution, including officers, numbered in 1904, 74, and the total matriculation of students was 727.

J. M. McBRIDE, LL.D.,

President Virginia Polytechnic Institute.

Virginia Resolutions. The, in American history, a set of resolutions drawn up by James Madison in 1798. They were similar in import to the Kentucky resolutions (q.v.) drawn up the same year.

Virginia, University of, the State university located at Charlottesville, Va. As early as 1779 Thomas Jefferson presented to the Virginia assembly his plan for public education, which included a university. This scheme was not, however, immediately carried out; and after 1814 Jefferson devoted himself largely to the work of founding a university in accordance with his ideal. It was finally established by act of the State legislature in 1819; and was

first opened to students in 1825. From 1850 to 1861 was a time of especial prosperity and large attendance; during the war the college suffered a large loss of students, but nevertheless continued in session; after that its work continued successfully with gradually increasing attendance. In 1895 the Rotunda, Annex, and some adjacent smaller buildings were destroyed by fire, but the Rotunda, restored exactly and three other large buildings were formally opened in 1898. Since this several other important buildings have been added. The government of the university is vested in a board of visitors of nine members appointed by the governor with the approval of the Senate for terms of four years. The organization of the university comprises five departments: (1) the Academic Department; (2) the Department of Engineering; (3) the Department of Agriculture; (4) the Department of Law; (5) the Department of Medicine. The work in these departments is grouped in 22 distinct schools, each offering an independent course, under the direction of the professors who are responsible to the board of visitors alone for their work. The work in the Academic Department is entirely elective; the courses are arranged in seven groups from each of which one course must be elected; the other courses required may be elected from these seven, or from an eighth, including courses in law, medicine, engineering, etc. The degree of B.A. is conferred for the completion of 10 undergraduate courses chosen from the eight groups; the degrees of M.A. and Ph.D. are conferred for graduate work, suitable graduate courses being offered in each school. The Department of Engineering offers four courses leading respectively to a degree in civil, mining, mechanical and electrical engineering; the degrees conferred are civil engineer, mining engineer, mechanical engineer, and electrical engineer. The Department of Agriculture was founded on the gift of Samuel Miller of Lynchburg; it confers the degree of B.S. The Department of Law offers a two years' course leading to the degree of B.L., and the Department of Medicine a four years' course leading to the degree of M.D. Connected with the Department of Medicine is the university hospital affording opportunity for clinical work, and the training school for nurses. There is a Summer Law School, established in 1870, and summer courses are also provided in other departments at the discretion of the professors. In 1904 the board of visitors established a co-operative bookstore on the university grounds, the object being to furnish books and other supplies at the lowest possible price; it gives employment to a student manager, and to several student clerks. The students maintain an athletic association, having charge of athletic sports, two literary societies, several department and graduate societies, and a Young Men's Christian Association. This Christian Association, the first college association in America, will by 1905 have a beautiful building, given by Mrs. William E. Dodge of New York. The original buildings of the university were planned by Jefferson and are purely classic in style; the more recent additions have been made to harmonize with and complete his plan. The central group encloses a quadrangle, 1,000 feet in length and 300 feet wide. The dominant structure of this group is the Rotunda, the library building at

VIRGINIANS—VIRUS

the north end, modeled from the Roman Pantheon; other buildings around the quadrangle are the main academic building, the physical laboratory, the mechanical laboratory, and the original buildings designed by Jefferson. Parallel with the latter are the eastern and western "ranges" of dormitories; outside the quadrangle group are the chapel, the natural history museum, the chemical laboratory, the medical building, the observatory, the infirmary, several dormitories, and the gymnasium. The campus also contains an athletic park, recently laid out, comprising 21 acres. Tuition in the Academic and Agricultural departments is free to Virginia students; the university awards scholarships to accredited schools; and there are several alumni scholarships, and a number of special scholarships. The general library in 1904 contained over 50,000 volumes; and in addition there are law and other departmental libraries. The students in 1904 numbered 660, of whom 301 were in the Academic Department.

CHARLES W. KENT, PH.D.,
Professor of English Literature, University of Virginia.

Virginians, The, a novel by William Makepeace Thackeray, published in 1859. It is a sequel to 'Henry Esmond,' and revives a past society with the same brilliant skill.

Virginius Affair, The. It was in the harbor of Santiago de Cuba that the historic "Virginius affair" occurred in 1873 which almost caused a war between the United States and Spain. The *Virginius*, a ship registered in the New York custom house 26 Sept. 1870 as the property of an American citizen, was captured on the high seas near Jamaica by the Spanish man-of-war *Tornado*, 31 Oct. 1873. The reason given was that she was about to land men and arms in Cuba, which was then engaged in the "Ten Years' War" against Spain. At the time of capture the *Virginius* was flying the American flag. She was taken to Santiago. President Grant remonstrated with the Spanish government, and through the United States minister to Spain, Gen. Daniel E. Sickles, demanded the release of the *Virginius* and her crew.

Spain was at that time a republic, under President Castelar, and while his government was asking for time to obtain information and was making promises, the authorities in Cuba determined to take matters into their own hands. On 7 Nov. 1873 the captain of the *Virginius*, Joseph Fry, and 36 of the crew, were shot. The next day 12 of the most prominent passengers were also shot. When the news of this action became known in the United States the excitement was intense. Meetings were held, and the bloody work was denounced. President Grant authorized the putting of the navy on a war footing, diplomatic relations were on the point of severance and war was imminent. Meanwhile President Castelar made the excuse that his orders to stay proceedings were received too late to prevent the crime.

Several times it seemed that hostilities could not be avoided. Once, Gen. Sickles sent for a ship to take him from Spain. At last, however, on 29 November, a protocol was signed between Secretary Fish and Admiral Polo, by which Spain agreed to surrender the survivors of the crew and passengers of the *Virginius*, together

with the ship, and to salute the flag of the United States on 25 December. If, however, it should be proved in the interval that the *Virginius* had no right to fly the United States flag, the salute should be dispensed with, though Spain should disclaim any intention to insult the flag. Three days before the time agreed on, Secretary Fish announced himself as satisfied that the *Virginius* had no right to fly the flag, and the salute was dispensed with. On 23 January Admiral Polo made the disclaimer agreed on. The *Virginius* was delivered to the United States navy at Bahia Honda on 16 December with the American flag flying. She was, however, unseaworthy and, encountering a heavy storm off Cape Fear, sank. The prisoners who survived were surrendered on 18 December at Santiago de Cuba, and landed in safety in New York.

Virgin's-bower. See CLEMATIS.

Virgo, vēr'gō, the sixth sign of the Zodiac, and also the name of a constellation which formerly marked this sign, but is now in the sign Libra. It contains the bright star Spica, and is on the meridian in the evenings of May and June. See ASTRONOMY.

Viriathus, vī-rī'a-thūs, Lusitanian patriot: d. 140 B.C. He was originally a herdsman, but became a leader in the ten years' struggle against the Roman power for about 151 B.C. He conducted a successful defense against the Roman army, defeating them repeatedly and finally hemmed in their forces and compelled the conclusion of a treaty of peace in order to save the army. The independence of Lusitania was acknowledged, and she became an ally of Rome, a treaty ratified by the Roman senate. In 140, however, Servilius Cæpio succeeded to the consulship in Further Spain, invaded Lusitania, and by bribery secured the murder of Viriathus, after which he conquered the country.

Viroqua, vī-rō'kwā, Wis., city, county-seat of Vernon County; near the Kickapoo River, and on the Chicago, Milwaukee & Saint Paul Railroad; about 85 miles northwest of Madison and 25 miles southeast of La Crosse. The city is in an agricultural and lumbering region, and is noted for the abundance of trout and game in the near vicinity. There are, each year, large shipments of grain, lumber products, farm products, and live stock. Pop. (1890) 1,270; (1900) 1,950.

Vir'us, the contagium of an infectious disease. The term more especially designates those peculiar poisonous matters which can reproduce themselves under favoring conditions to an endless degree. The poison of the cobra is a specific virus which, when introduced into the human system, acts as a most virulent poison; but the poison is not multiplied within the human subject, and one person affected by the poison cannot communicate the disease to another. In like manner, morbid products from decaying vegetables under certain conditions of heat and moisture may possibly originate the virus of malarial fever; but the virus is not propagated within the human organism, or, at all events, never in such a form as to render it capable of producing the same disease in others. By some the virus of the contagious or infectious diseases is supposed to be a *contagium vivum seu animatum*, the theory being that the

virus consists of living beings or low organisms. Such views have been advocated by Kircher, Lancisi, Vallisneri, Réaumur, Linné, Henle, Roberts, and others; and although the theory of a *contagium vivum* is not as yet complete, the discussion of it is the most important which has ever engaged the attention of medical men. The most prominent characteristic of each specific virus is that it can reproduce itself within the human organism, and to an unlimited extent, each virus preserving its own specificness. Experience and observation tend to confirm the hypothesis that each specific disease breeds true, though, in the course of 1,000 years, it is possible that changes within certain limits may take place, as is the case in animals and plants. The natural conclusion follows that diseases of this class do not originate spontaneously, but are propagated each from its own kind, though some contend that they do not originate, even in our own day, spontaneously or autochthonously. Another remarkable peculiarity belonging to many, but not to all, diseases propagated by a specific virus, is that a single attack of the disease successfully surmounted produces absolute or relative immunity (q.v.) for a certain length of time, or even for the remainder of life. See BACTERIA; DISEASES, GERM THEORY OF.

Visalia, vī-sā'li-a, Cal., city, county-seat of Tulare County; on the Kaweah River, and on the Visalia & Tulare railroad; about 40 miles, in direct line, south of Fresno and 10 miles north by east of Tulare. It was settled about 1850, laid out as a town in 1852, incorporated in 1874. It was made the county-seat in 1853. It is in an agricultural region, and the chief manufactures are canned fruits. There are extensive shipments of farm products, fruit, and canned goods. The city has three state banks having a combined capital of \$250,000 and deposits amounting to \$929,730. Pop. (1890) 2,885; (1900) 3,085.

Visayan (vī-sā'yān) Islands, or **Visayas**, the central and largest group of the Philippine Archipelago, lying between lat. 9° 2' and 13° 5' N., and between lon. 121° 49' and 125° 51' E.; north of Luzon, and south of Mindanao; land area, 23,502 square miles; total area, 77,840 square miles. It consists of the islands of Bohol, Cebú, Leyte, Masbate, Negros, Panay, Romblón and Samar and their dependent islands, numbering in all 490. Many of the dependent islands are of geographical and commercial importance; chief among them are Lapénin Grande and Panglao (belonging to Bohol), Mactán (Cebú), Bilarian and Panaón (Leyte), and Guimaras (Panay). The staple products hemp, sugar, tobacco, coffee, rice, cotton, corn, and cocoa, of the archipelago are cultivated, the production of hemp being especially important in Cebú, Leyte and Samar. All the islands are well wooded; the best varieties of hardwoods grow in abundance, and many resin and gum trees. The mineral wealth is also of importance, the first coal discovered in the Philippines having been found in Cebú. Gold, silver, iron, and copper are also found; though these are mined to some extent, the mineral resources are by no means fully exploited. The mechanical industries of these islands include sugar manufacture, weaving, the making of sugar sacks, and cheesecake-making (in Cebú). Stock-raising and the trepang, pearl shell and pearl fisheries are also

important industries. There is a large export trade in the products of agriculture, the manufactures, and the fisheries. The land transportation facilities are especially good in Bohol, Cebú, Leyte, Negros, and the province of Iloilo, Panay. See also the names of the more important islands comprising the group.

Visayas, vī-sā'yās, or **Bisayas**, a Malay people of the Philippine Islands, inhabiting the Visayan Islands (q.v.), and the northern and eastern coast of Mindanao. At the time of the arrival of the Spaniards they had a written language and considerable culture of their own; they practised the custom of tattooing, and were therefore called by the Spaniards *Pintados* (painted men). They were easily Christianized, and joined with the Spaniards in helping to subdue the Tagals. They are a docile and industrious people; particularly the inhabitants of Bohol are good mechanics, and for their success in trade have gained the name of the "Chinese of the Philippines." Their language shows a large variety of dialects, of which the most important are the Cebuano and Panayano.

Viscach'a, the *Lagostomus trichodactylus*, a stout rodent belonging to the family *Chinchillidae* and resembling a marmot. It is from 18 inches to two feet long, exclusive of the tail, which measures from six to eight inches. The fur is mottled gray above, yellowish-white beneath; a dark band on each cheek, a white band on muzzle, running back on each side almost as far as the eye. Viscachas are nocturnal, live in communities, and resemble rabbits in their habits, but are less active. They are found on the pampas, from Buenos Ayres to Patagonia. These animals have the strange habit of dragging all sorts of hard and apparently useless objects to the mouth of their burrow, where bones, stones, thistle stalks, and lumps of earth may be found collected into a large heap, sufficient, according to Darwin, to fill a wheelbarrow. They form the principal food of the wolves, pumas and jaguars of their country.

Viscaino, vīs-kā-ē'nō, **Sebastian**. See VIZCAINO.

Viscelli'nus, **Spurius Cassius**, first Roman agrarian agitator. He was victorious over the Sabines as consul (502 B.C.) and in his second consulship (493) made a treaty with the Latins, which was advantageous to both parties. In his third consulship (486) he proposed a measure by which the plebeians should have a share in the *ager publicus*. The patricians immediately accused him of making favor with the commons in order that by them he might be chosen king and set on the throne of the recently expelled Tarquins. He was condemned to be thrown from the Tarpeian rock, in the execution of which sentence his own father took part.

Vischer, fish'ēr, **Peter**, German sculptor: b. Nuremberg 1455; d. there 7 Jan. 1529. He was invited by Philip Elector Palatine to Heidelberg, but soon returned to Nuremberg, where he executed a great many works with the assistance of his five sons. Among his most celebrated works, whose architectural parts combine Gothic with Renaissance features, while his figures have all the realism of the Renaissance, may be mentioned: 'The Tomb of Bishop John IV.' in the cathedral at Breslau (1496); the 'Tomb of Archbishop Ernest' in the cathedral at Madgeburg (1497); the 'Tomb of Saint Se-

Baldus in the church of that dedication at Nuremberg; and the 'Tomb of Eitel-Friedrich II. von Zollern and of his wife in the church at Hechingen'; etc.

Vischer, vish'ér, **William Lightfoot**, American author and actor: b. Owingsville, Ky., 25 Nov. 1842. He was graduated from the law department of the University of Louisville, but never practised, subsequently engaged in journalism and is now (1904) on the stage. He has published several novels, among which are 'Way Out Yonder'; and 'Peter Vansant'; 'Blue Grass Ballads'; etc.

Visconti, vīs-kōn'tē or vēs-kōn'tē, an old Milanese family, celebrated for its political consequence and its patronage of science. History makes mention of the Visconti in the 11th century; but they disappear from the time of the destruction of Milan by Frederick Barbarossa, when, with some other noble families, they were obliged to yield to the superior power of the opposite party, the Torriani or family Della Torre. The first of the Visconti who laid the foundation of their greatness was **OTTONE**: b. 1208; d. 1295, created archbishop of Milan in 1263, and perpetual lord of Milan in 1277, who gained the ascendancy over his enemies, and bequeathed his power to his nephew, **MATTEO**: b. 1250; d. 1322. The latter was, however, driven into banishment by the Torriani, but after living in exile seven years, had the address to obtain the title of imperial vicar 1294, which he soon exchanged for that of lord-general of Milan (1311). Matteo transmitted the supreme power to his eldest son, **GALEAZZO**: b. 1277; d. 6 Aug. 1328, who was overpowered by his enemies and thrown into prison by Louis of Bavaria in 1327, but was soon after released. His son **Azzo**: b. 1302; d. 14 Aug. 1329, who succeeded him and increased the extent of his dominions, acquiring nearly all of Lombardy, was not less distinguished for his pacific virtues than for his military talents. His uncle **LUCCIANO**: b. about 1287; d. 24 Jan. 1349, succeeded him. The latter extended the dominions of the family, and was the first of the name who was distinguished as a patron of science and art. He corresponded with Petrarch. After his death in 1349 his brother, **GIOVANNI**: b. 1290; d. 5 Oct. 1354, archbishop of Milan, assumed the reins of government. He was a zealous patron of letters. He appointed a commission of six learned men to compose a commentary on Dante, fostered the University of Bologna, and received Petrarch on his arrival at Milan with the highest marks of distinction. Giovanni was succeeded by his nephews, **MATTEO II.**: d. 1355; **BARNABO**, d. 1385; and **GALEAZZO II.**, d. 1378. Matteo's two brothers, who shared their estates on his death, though eminent for their warlike talents, rendered themselves obnoxious by their cruelty and other vices. Galeazzo, however, continued to treat Petrarch with the same respect that his predecessors had shown him, and employed him in several negotiations. He was succeeded in 1378 by his son, **GIAN GALEAZZO**: b. about 1347; d. 3 Sept. 1402, who imprisoned his uncle Barnabo in the castle of Trezzo, and took upon himself the sole government (1385). In him the Visconti family reached the summit of its grandeur and splendor. In 1395 he received from the Emperor Wenceslas the ducal dignity; and his territories were more extensive than

those of any of his predecessors. Pisa, Siena, Perugia, Padua, and Bologna were subject to his sceptre; and he had already shown a disposition to assume the title of king of Italy, when his ambitious projects were cut short by his death of the plague. He fostered science and art, collected the most distinguished scholars at his court, restored the University of Piacenza, and connected that of Pavia with it, and founded a large library. He built the celebrated bridge over the Ticino at Pavia, and began the magnificent cathedral at Milan. Gian Galeazzo left three sons, **GIAMMARIA**; d. 16 May 1412; **FILIPPO MARIA**; d. 13 Aug. 1447, and an illegitimate child, **GABRIEL**; d. September 1408. Giammaria succeeded to the dukedom, and was assassinated, after which Filippo Maria reigned alone till his death. His natural daughter, Bianca, had been married to Francesco Sforza, who was named duke of Milan in 1450. Consult: Sismondi, 'Histoire des républiques italiennes' (1826-33); Symonds, 'The Age of the Despots' (1875).

Visconti, Ennio Quirino, Italian archæologist: b. Rome 1751; d. Paris 7 Feb. 1818. He was the son of Giovanni Battista (q.v.), and from his earliest years was trained in the habits of an antiquary. He continued the work begun by his father, entitled 'Il Museo Pio Clementino descritto,' of which he wrote the greater part and which extended to seven volumes, the last appearing in 1807. In 1785 he was appointed keeper of the Capitoline Museum. In 1798 he was one of the five consuls of the Roman Republic, and during a consulate of seven months founded the Roman Institute. In 1799 he left Italy and settled in Paris, having been appointed an administrator of the museum of the Louvre, and professor of archæology. His archæological works are very numerous, and among the most popular are 'Description des Antiques du Musée Royal'; 'Description des Vases peints du Musée'; 'Iconographie Grecque'; and 'Iconographie Romaine.'

Visconti, Louis Julius Joachim, French architect: b. Rome 11 Feb. 1791; d. Paris 1 Dec. 1853. His architectural studies were prosecuted at Paris under Percier and Fontaine, and at 17 he entered the Ecole des Beaux Arts. In 1817 he was superintendent of building on the Paris Wine Market; in 1822 inspector of building to the city government; and 1825 architect of the great library of Paris. His most important works are the tomb of Napoleon I., under the dome of the Invalides; and the additions to the Louvre, which latter he did not live to complete.

Visconti-Venosta, vēs - kōn'tē - vā - nos'tā, **Emilio Morquis**, Italian statesman: b. Milan 22 Jan. 1829. In 1846 he entered journalism as a liberal and for a time was an adherent of Mazzini. In 1859 he was appointed by Cavour royal commissioner at Garibaldi's headquarters in Lombardy, was elected to the chamber of deputies in 1860 and was minister of foreign affairs 1863-4, 1866-7, and 1869-76. He became senator in 1886, was minister of foreign affairs for a fourth time 1896-8, and in the Pelloux cabinet held the same post 1899-1900, as also in that of Saracco, 1900-1. His foreign policy was characterized by an ardent desire to retain the good will of France.

Viscos'ity, is that property of matter by virtue of which resistance to change of shape

depends on the rapidity of the change. All substances, ranging from gases to solids, are supposed to possess this property in a greater or less degree. A noteworthy instance of viscosity is exhibited by sealing wax; for while it is quite rigid in resisting forces quickly applied, it will change shape greatly under the action of a small force (its own weight, for example) applied continuously for a long time. Molasses, tar, asphalt, and many other substances, also illustrate this property in a striking way; while water, alcohol, air, and other liquids and gases, as shown by suitable experiments, possess the same property in a less degree. The viscosity of a medium is measured by the quotient of the tangential stress developed along any plane in the medium, by relative motion of its parts, divided by the rate at which the velocity of the medium is changing with distance perpendicular to that plane. More briefly, this measure, which is commonly called the coefficient of viscosity, may be defined as the quotient of the resultant tangential stress at any point of the medium divided by the resultant angular velocity of the medium at the same point.

Viscount, *vī'kownt*, a British title of nobility, next in rank to that of earl, and immediately above that of baron. It was first conferred by letters patent on John, Lord Beaumont, by Henry VI. in 1440. The title is frequently attached to an earldom as a second title, and is held by the eldest son during the lifetime of the father.

Viscous Fermentation, an undesirable form of fermentation that sometimes accompanies alcoholic or acetic fermentation. It yields a gum-like ropy substance that injures the fermenting mass.

Vishnu, *vīsh'noo* ("the Preserver"), the second god of the Hindu triad, and by his special worshippers considered to be the greatest. The development of the Hindu religion is naturally divided into three periods. In the first, or Vedic period, Vishnu is one of the gods who represent the various qualities of the sun. In a few hymns he is specially distinguished, but in general he is classed without distinction with gods who were regarded as inferior to Indra, and fewer hymns are dedicated to him than to some others. In the second or epic period Vishnu is elevated to the rank of first of the *Adityas* or luminous offspring of *Aditi* (space). Of the two great epics — the *Rāmāyana* and the *Mahābhārata* — the former is entirely devoted to the glory of Vishnu, one of whose *avatārs* it celebrates; the latter is divided between him and Siva, the third god of the triad, whose worship during its period began to prevail over that of Vishnu. In the third period, which is represented by the *Purāṇas*, the worshippers of Vishnu and Siva are divided into different sects, and their respective creeds are propagated in separate *Purāṇas*. The distinctive characteristic of the worship of Vishnu is his *avatārs* or incarnations, which greatly excel in number and importance those of Siva or any other god. The number of the *avatārs* of Vishnu varies in different authorities. Sometimes they are regarded as almost innumerable; but there are ten principal *avatārs* distinguished by specific names. Some of these *avatārs* appear to have had at first a purely cosmical character and others to have been founded on great historical movements of

a religious nature. Vishnu is always represented as becoming incarnate to oppose the power of the demons, restore the authority of the gods, or otherwise to effect some beneficial change in the government of the universe. The last *avatār* is yet future. See *INDIA, Religions*; *VAISHNAVAS*; *VEDAS*.

Vishnu, Institutes of. A work of standard authority in the religious faith and practice of the Hindus. In its recognized and partly modern form it consists of 100 chapters of legal precepts and aphorisms, put under the name of Vishnu, originating from the early Vedic school called the *Cathas*, but much added to in subsequent times. See *INDIA*; *SANSKRIT LANGUAGE AND LITERATURE*; *VEDAS*; *VISHNU*.

Visible Church, an ecclesiastical term meaning the Church, as seen by man, not as it appears to God. It includes the whole body of professing Christians, some of them regenerate, others unregenerate, as distinguished from the Invisible Church, consisting of all those who are worthy in the sight of God to be members of His Church.

Visible Speech, the name given by its inventor, Alex. Melville Bell, to a system of alphabetical characters designed to represent every possible articulate utterance of the human organs of speech. It is based on an exhaustive classification of the possible actions of the different organs concerned in speech, and to every organ and every mode of action of an organ a symbol is assigned. Of these radical symbols there are in all 30, and by combinations of these 30 symbols some hundreds of characters may be formed to represent the sounds of the human voice, but little more than 100 characters are actually required for all the ascertained sounds of different languages, and only two thirds of the 30 radical symbols are required in forming the signs or letters necessary for the writing of any European language. In form the letters are as simple as those of the Roman alphabet. After completing this system, Mr. Bell submitted it to the consideration of a large number of gentlemen well qualified to judge of its value, and allowed it to be tested in their presence in such a manner as to make quite clear its efficiency for the purposes for which it was devised. See *DEAF-MUTES, DEFECTIVES, EDUCATION OF*.

Visigoths, *vīz'ī-gōths*, or **West Goths**, the western branch of the Goths (q.v.), who after the death of Theodosius broke into Italy under Alaric, and captured Rome in 410. Alaric died later in the same year before he had matured his plans, and after his death his brother-in-law Athaulf, who was placed at the head of the nation, turning toward Gaul, made new conquests on both sides of the Pyrenees. He reached Barcelona, where he was murdered in 415; but his successors continued to extend their dominions in Gaul and Spain. Wallia made a treaty with the Romans, and in return for certain services received under their nominal suzerainty, though in virtual independence, western Aquitania, with Toulouse as capital. He died in 419. His successor, Theodoric I. (419-451), was treated by the Romans as an independent ruler, and took part in the victory over Attila on the Catalaunian Fields in 451. Euric (466-483), third in succession to Theodoric, conquered the Suevi and other races, and is considered the

VISION

founder of the Visigothic kingdom. Clovis, king of the Franks, on pretense that it was unjust to let the heretic Visigoths possess the fairest portion of Gaul, attacked the peaceful Alaric, Euric's successor, and defeated him at Vouglé in 507. The Franks obtained possession, without resistance, of most of the cities in southern Gaul, and the kingdom of the Visigoths would have been in great danger had not Theodoric, king of the Ostrogoths, undertaken its defense. While guardian of the Visigothic prince, his grandson, he embraced the favorable opportunity to make himself master of a part of the territories still belonging to the Visigoths in southern Gaul; and after a long separation of the two nations there existed for a time an intimate connection of the Ostrogoths and Visigoths. After his death dissensions soon arose among the Visigoths, and the pernicious influence of differences of religion became more and more evident. The kingdom of the Visigoths arose again with new energy under Leovigild (568-586), who totally subdued the Suevi, improved the laws, limited the power of the nobles, made Toledo the royal residence, and tried to render the regal power hereditary. His son Recared adopted, on his accession (586-601), the Catholic faith, upon which the divisions of the people ceased, and Goths and Spaniards became one nation. Under his reign was held the Council of Toledo. His conversion had the most important influence on the character of the government. As soon as the Catholic faith became the established religion, the clergy, who had been completely subservient to the king under the Arian form of Christianity, acquired a predominant influence, and constituted a hierarchy under the direction of the Papal authority. The Arian bishops had lived quietly in their dioceses, and had no influence on the public administration; but the Catholic bishops obtained an active participation in public affairs. The grandees of the kingdom, usurping the rights of popular representatives, remained no longer the first class in the state; the mode of choosing the king was altered in favor of the bishops; and under weak kings these found it easy to place themselves at the head of the state and to procure exemption from all public burdens. As early as 633 the regulation was made that those secular grandees alone should be admitted to the councils who should be pronounced worthy by the bishops. Internal disturbances facilitated the conquest of the country by the Saracens, who were settled on the north coast of Africa. In 675 these Mohammedans had begun their attempts to settle in Spain, and during the reign of the weak Roderick were enabled to execute their project. The Goths were defeated in 711 at Xeres de la Frontera; the king was slain, and the Saracens spread themselves over the greatest part of the country. (See SPAIN.) The remainder of the Goths, who, after the downfall of the kingdom, fled to the mountains of Asturia and Galicia, founded there new kingdoms, in which the constitutions of the Visigoths were in part retained, and which, when their descendants broke forth from their fastnesses and wrested from the Moorish settlers one tract after another, finally gave rise to the kingdoms of Spain and Portugal. The traces of the public institutions of the Visigoths were preserved in the laws. The most ancient collection of Spanish laws, the *Fuero Juzgo*, or *Forum Judicum* (see *FUERO*),

is drawn from the ancient laws of the Visigoths; and many of their institutions have been retained to the present day in the provincial laws of Castile and Catalonia. The Spanish language contains a strong admixture of the Gothic element. Consult Hodgkin, *Italy and her Invaders* (1880-5).

Vision, the sense of sight. Visual sensations include brightness qualities (blacks, whites, and grays), and color qualities (reds, greens, yellows, purples, etc.). They are produced by the vibratory action upon the eye of the luminiferous ether and, in conjunction with certain other sensations, set up in and about the eye by the stimulation of muscles and tendons, they give rise to the visual perception of objects and processes in the outside world. A descriptive account of vision has to deal (1) with the visual apparatus, both as a dioptric or refracting mechanism, which conveys light-rays to the retina, and as a nervous organ, which transforms the vibratory stimulus into neural excitation and transmits it to the brain; (2) with the sensations of brightness and color as regards their quality, number, classification, etc.; (3) with the specific processes which underlie and condition visual sensation; and (4) with those perceptions of things and events which come to mind through the avenue of sight.

The Visual Apparatus.—This apparatus consists of the eye, the optic nerve, subcortical centres (of the corpora quadrigemina and thalami), and terminal or central areas in the cortex of the occipital lobes. It is generally believed that visual sensations are directly correlated with the functions of the last or cerebral part, only, of the visual mechanism; the office of the eye, the optic nerve, and the lower centres being the transmutation of ether-vibrations, the transmission of nervous impulses to the brain, and the setting up of various movements—such as rotation of the eyes, accommodation, and winking—which are important factors in visual perception.

In the human adult, the eye is a spheroidal mass having an antero-posterior diameter of about one inch. The central part of its front surface (the cornea) possesses a higher convexity than the remaining opaque surface. It is seen from a lateral position as a bulging transparent covering. The eye is invested with three coats and its interior is divided into two chambers; a smaller anterior cavity containing the aqueous humor and a larger posterior cavity filled with the vitreous body. Between the two chambers lie the iris (the colored part of the eye), its circular opening (the pupil), and the crystalline lens.

The function of the refracting mechanism, which includes the cornea, the aqueous and vitreous humors, and the lens, is to focus the light entering the eye, and to project upon the retina a small inverted image of the object seen. The eye is essentially a small camera. It differs, however, from the ordinary photographic camera in adjusting its focus for different distances by changing the convexity of its lens—not by altering the position of its sensitive surface, the retina. The process of increasing the convexity of the crystalline lens is known as accommodation. It is compassed by the reflex action of the ciliary muscles which permits the lens to bulge forward in viewing

VISION

near objects and to flatten out in viewing distant objects. The retinal focus is thus maintained. The eye rests in its socket on a cushion of fat, and is turned in its orbit by the joint action of three pairs of antagonistic muscles, the internal and external recti, the superior and inferior recti, and the superior and inferior obliqui. Since the two eyes function as a single organ (binocular vision), it is important that they move together and thus bring the images of an object upon corresponding retinal areas. The turning inward of the eyes in their common fixation of an object is called convergence.

The true nervous end-organs for vision lie in the retina. The retina is a complex structure, of no less than eight strata or layers, which forms the innermost coat for the posterior part of the eye. Within it are the rods and cones, which stand closely connected with the neural elements leading to the brain, and which are probably the seat of those changes that transform the vibrations of the luminiferous ether into the immediate stimulus for nervous excitation. The neural elements (nerve-fibres) which transmit the excitation unite near the centre of the retina, pierce the outer investments of the eye at the porus opticus—called also the "blind spot," because the retina at this point is insensitive to light—and continue as the optic nerve. The two optic nerves come into communication below the brain, in the median plane of the body, and form the optic chiasma. Beyond the chiasma there is a second division, a part of the fibres of both nerves passing to each hemisphere of the cerebrum.

Sensations of Color and Brightness.—Visual sensations include the colors seen in the solar spectrum, a series of purples ranging between red and violet, and all the grays, whites, and blacks. Colors proper (that is, excluding mere brightness qualities) form a closed series in which one may pass by small gradations from any quality, as red or green, through every other quality, and arrive finally at the starting point. For this, it is only necessary to join the red and violet ends of the spectrum by inserting the purples. The closed color-series naturally falls into halves. The one half contains the reds, oranges, and yellows, which obviously belong to a single group of qualities, the "warm" colors; the other half, the greens, blues, and violets, the "cold" colors. The line of division falls in the purples on the one side, and in the yellow-greens on the other, both these colors including transitional points between the two types. Within each group, again, may be distinguished two sub-types, the red and yellow types in the one, the blue and green in the other. To each group belong several neighboring qualities which merge gradually into one another. To complete the classification of visual sensations it is necessary to bring the color sensations into relation with brightness (the gray series). That an intimate relation obtains between the two series is shown by the fact that each color has itself a certain brightness; the yellow of the spectrum, for example, has a brightness corresponding to a light gray, while spectral blue corresponds in brightness to a medium gray. Moreover, it is possible to pass gradually from any color to a pure brightness. This transition occurs, for example, in the fading of painted surfaces into gray. In such a case, the richness or saturation of the color is said to be reduced. The relation of color tones

(colors in the narrower sense) to each other, to brightness, and to saturation is represented in the accompanying figure (Fig. 1). The vertical axis (W Blk) of the double pyramid represents the gray series from white to black. The letters around the base (G, Ol, Y, Or, etc.) stand for color tones at maximal saturation. The saturation of any tone is represented by the length of a perpendicular dropped from the point in the base where the color is found upon the gray axis; the brightness of any tone, by the point where this perpendicular strikes the axis. The inclination of the base brings the perpendicular from yellow (Y) higher up the axis than the perpendicular from blue (B). This is in accord with the greater brightness of the former color. The number of pure brightnesses that can be discriminated is estimated to lie between 650 and 800; the number of color tones—reds, greens, violets, etc.—is about 150.

To produce the large number of possible color tones it is not necessary to have recourse to a corresponding number of wave-lengths;

Fig. 1.—Color Pyramid.

for, given a small number of tones, properly chosen, it is possible to produce all the others by the process of color-mixture. One of the most common methods of mixing colors is by the use of pigments; another is by rapid rotation of the color-wheel, which carries two or more sectors of colored paper or cardboard. At a certain rate of revolution of the color-wheel the observer ceases to see the separate sectors and sees instead a single homogeneous color which is different from either of the sectors used. The tone of the "mixed" color depends upon the relation of the colors mixed. If two colors stand near each other in the spectrum, the "mixed" color is intermediate; for example, red and yellow mixed give an orange, violet and red, a purple. There is, however, for each color, a "complementary" color which when mixed with it in a certain proportion gives—not a color tone at all, but—a pure gray or white. It should be noted that, in

VISION

every case, it is *stimuli* that are mixed and not sensations; that the mixture is of physical or physiological processes, not mental processes. A "mixed" color is as simple, psychologically, as any other.

Visual sensation depends not only upon the light stimulus to which the eye is exposed and upon the mixture of stimuli, it depends also upon (a) the part of the retina stimulated, (b) the stimulation of adjacent areas, and (c) certain more or less permanent effects left by the stimulus upon the visual organ.

(a) It is only in the central part of the retina—the part lying about the fovea or spot of clearest vision—that all the colors are seen; further out toward the periphery of the retina lies a zone in which reds and greens are not sensed (only blues and yellows), and, still further out, an outermost zone whose stimulation gives rise to brightness sensations, only. That is to say, the normal eye is totally color-blind over a part of its sensitive area and partially color-blind over a second part. Abnormal color-blindness, then, which is relatively common in the race, may be regarded—at least in its commoner forms—as an extension to the fovea of the normal color-blindness of the normal eye.

The eye is a chemical sense; that is, chemical processes are interpolated between the reception by the eye of light-waves and the neural processes that are ultimately set into function by them. Two special results follow from this fact. First, stimulation is not strictly confined to the part of the retina directly affected by light; and, secondly, nervous excitation continues after the external stimulus has ceased to operate. (b) The first of these results, retinal irradiation of chemical or photo-chemical processes, is strikingly demonstrated by the phenomena of contrast. A patch of white looks whiter if it is placed on a black surface; black looks blacker in the neighborhood of white. In a similar manner, the saturation of a color (for example, red) is enhanced if it is brought near a complementary color (blue-green); and, finally, a gray in the immediate neighborhood of a color (for example, green) is tinged, under certain conditions, with the complementary of that color (purplish red). The last case, the induction of a contrast color upon a gray, may be observed in the shadows of snow, which often look blue under yellow sunlight. The general effects, both of brightness and of color contrast, are, moreover, frequently to be seen in clothing and in interior decorations. The fundamental law of contrast is that the contrast effect is always in the direction of the opposite brightness or of the complementary color. (c) The result of continued stimulation of the eye is to change the condition of excitability of that organ. If large colored glasses be worn before the eyes for several minutes the unnatural hue of objects, which is at first very noticeable, gradually disappears. With blue glasses, objects at first look bluish, but finally return to their proper tones. The eyes are said to have become blue-adapted. A similar effect is produced if only a small part—not the whole of the retina—is exposed for some moments to colored light. A piece of red paper, for example, hung on a gray wall and fixated steadily gradually loses its saturation and approaches a gray. But not only is the excitability of the eye altered under continued stimulation; it remains altered,

as noted above, even after the exciting cause has ceased to operate. When the blue glasses are removed the landscape looks yellowish; the observer is yellow-sighted. Similarly, when the red paper is removed, a bluish-green patch appears upon the gray wall. The first result is due to general adaptation, the second to local adaptation. In both instances, adaptation forms a predisposition for seeing colors which are complementary to the original stimulating colors. The result of local adaptation (as the bluish-green patch induced by the reddish paper) is a negative after-image. Adaptation and after-images follow the same course with brightnesses as with colors. It is, for example, a matter of common observation that confinement in a darkened room enhances the brightness of objects seen subsequently in full light; that exposure to a strong light (sunlight on snow) tends to reduce the apparent brightness of objects seen afterward in moderate illumination, and, finally, that fixation of a dark or a light area induces a negative after-image of the opposite brightness. All these phenomena illustrate the effects of adaptation.

Theories of Visual Sensations.—These theories aim to set forth the conditions under which the sensations arise. The most important in the field are the rival theories of Hermann v. Helmholtz and E. Hering. The Helmholtz theory provides for three primary sensations, red, green, and blue (or violet), which rest upon three distinct processes of excitation, in the visual apparatus. To explain the large number of spectral qualities, it is assumed that these three processes, combined in varying proportions, give rise to all possible color qualities, and that in equal amounts they produce gray. The theory, which was outlined by Thomas Young and elaborated by Helmholtz, was designed primarily to account for the facts of color-mixture; that is, for the production of a large number of "intermediate" qualities and of grays by means of a few "elementary" sensations. These facts of color-mixture it covers well; but it fails—particularly in its traditional form—to explain many other facts of color vision, notably the possibility of obtaining gray in the absence of color tone (as in color-blindness, peripheral vision, and from stimuli of small extent). Recently, important modifications and additions have been introduced into the theory which have, in a measure, removed its deficiencies.

The Hering theory rests upon a basis quite different from that of the Helmholtz theory. Hering posits three retinal substances; but he makes each of these the seat of antagonistic processes—processes of assimilation or building up and of dissimulation or tearing down. To each of these processes in each substance corresponds a "primary" color. Assimilation of one substance gives rise to blue; dissimulation of the same substance, to yellow. This substance is called briefly the blue-yellow substance. Similarly the other two substances are called the red-green substance and the black-white substance. Blue, green, and black correspond to the three assimilative processes; yellow, red, and white to the three dissimilative processes. All forms of stimulation affect the black-white substance; but certain wave-lengths produce no effect upon the other two substances. Moreover, the black-white substance appears in great-

VISION

est quantities, is most widely distributed throughout the visual apparatus, and is most easily set into function. Since assimilation and dissimilation are opposed processes, the principle of antagonism assumes great significance in Hering's theory: the principle is, indeed, its most characteristic feature. Its application to complementary colors—where the opposed processes in the several substances cancel each other—to contrast, to adaptation, to after-images, etc., follows naturally from the fundamental conception. Although the Hering theory is open to attack on various technical grounds, it undoubtedly covers the whole range of visual sensation more adequately than its rival. There is a good deal that is hypothetical in both theories. This is, however, a fault that recent work on the histology of the eye and on the function of the retinal elements is doing much to remedy. Within the last few years several new theories of visual sensation have come into the field. Most of them may, however, be regarded as modifications of one or other of the more classical theories just discussed. Their value and their relation to the older theories must be sought in the current literature of the subject.

Visual Perception.—It is characteristic of visual perception that all objects seen are spatial objects; that is, they occupy some place, some position in the spatial world; and they possess, likewise, spatial properties, form, distance, direction, etc. This characteristic, it should be noted, is shared by tactual perceptions; but it is not a mark of perception in general—not, for example, of the perceptions of melody, harmony, and rhythm. Since all visual perceptions are spatial, the chief problem they offer to psychology is the analysis of the spatial factors and the search for the conditions under which these factors operate.

The simplest factor in visual space is extension. Every visual sensation comes to consciousness as an extended sensation. A color is always "spread out"; its parts lie side by side. In this respect, colors and brightnesses are essentially different from tones and noises, which lack the attribute of extension. Space, as it is perceived, is an orderly arrangement of extended objects. It never exists by itself alone. There is no such thing, in perception, as "mere" space or "empty" space. Only by abstraction are the spatial properties removed from objects; only by abstraction, as in mathematics, does empty space come into existence. Even such quasi-abstract constructions as the line and the point do not properly figure in the psychology of space. It is, however, customary, within psychology, to distinguish two-dimensional and three-dimensional spaces; not because they differ fundamentally, but because they rest in part upon different conditions. The retina, being an extended organ upon which stimuli fall in patterns—thanks to the refractive functions of the transparent media—forms a natural substrate for the perception of surface magnitudes. But the retina is not so well adapted for tridimensional perception—perception of solid objects. A special provision for depth-perception is made, however, in binocular vision; that is to say, in the difference of the two retinal images which are thrown upon the two eyes by a single object. This difference in binocular images depends upon the different positions from which the two eyes observe the

object. Now it is conceivable that the two unlike images should have come to consciousness as two distinct objects. But, as a matter of fact, they do not, except under unusual circumstances—as when one squints or presses with the finger upon one eyeball. They do not even come to consciousness as two discrepant views of the same object. The difference in retinal images functions solely in the perception of depth or solidity. This is the principle involved in stereoscopic vision. Binocular perception of depth may be produced artificially by means of the stereoscope, an instrument which presents to the two eyes, under favorable conditions, two slightly different plane pictures of an object. Stereoscopic vision derives secondary aid, in ordinary perception, from linear and aerial perspective, from the known size of objects of reference, from change of position of the observer as well as of objects, from distribution of light and shade, etc.

The spatial functions of the eyes depend as well upon ocular movements and the sensations which they arouse as upon the immediate retinal factors just considered. It has been demonstrated, by many lines of experimentation, that were the eyeballs set firmly within the head without the possibility of movement (a condition which is approximated in the case of certain fishes) visual perception of objects would be enormously handicapped. In the first place, movement allows the eye to travel over the object, exploring it from point to point; in the second place, it sets up sensations both in the external muscles that rotate the eye and in the internal muscles of accommodation; and finally, it is probable that to these factors must be added articular sensations from the rubbing of the eyes in their sockets. All these sensations, muscular, tendinous, and articular, play important roles in the determination of the spatial properties and relations of objects.

The eyes, regarded as a perceiving organ, may be said, then, to fall into three parts; the retinas, which mediate visual sensations proper, and which function as a true double organ, the dioptric media, which focus the rays of light upon the retinas, and the movement-apparatus, which both alters the position of the retinal image and itself contributes kinæsthetic sensations from muscle, tendon, and orbit.

Asst. Professor Psychology, Cornell University.

Vision, Defects of. The conditions classed as defects of sight or vision are mainly due to anomalies in the structure of the eye, causing errors of refraction and other visual irregularities. Among the more common of these defects is that of astigmatism (q.v.), which is usually characterized by a symmetry in the curvature of the cornea (q.v.) in different meridians. Color-blindness (q.v.) is a serious disability in certain occupations. Day-blindness

VISION OF SIR LAUNFAL — VISITATION

(nyctalopia) is a condition in which one sees better in a dim light than in a bright light, due to some opacity in the cornea, the crystalline lens, etc. It occurs in amblyopia (q.v.) and other affections which produce dimness of vision. Night-blindness (hemeralopia), on the other hand, is a state in which the person affected has normal vision in an ordinary light, but in twilight becomes suddenly blind. Double vision (diplopia) occurs when, as in some cases of squinting, each eye sees things separately. This defect arises from derangement of the visual axis, sometimes through muscular paralysis.

In longsightedness or farsightedness (hyperopia or hypermetropia) objects are seen distinctly only at a range beyond that belonging to normal vision. Owing to the shortness of the eye-cavity the lenses are unable to converge the rays to a focus within the limits of the eye-chamber, the image being therefore formed (theoretically) behind the eye. This defect is corrected by the use of convex lenses, which by converging the rays of light cause the image to fall on the retina. Shortsightedness or nearsightedness (myopia) is the reverse of longsightedness in causes as well as in effects. In this, owing to the too great power of the crystalline lens, or to the extension of the eye-cavity too far backward, images from objects at some distance are formed in front of the retina, making the sight confused, if not entirely defective, for things beyond a certain limited range, while rendering it very clear for near objects. For remedying this condition biconcave glasses are employed, which, unless the myopia is serious, need be used only for looking at objects far off. Shortsightedness and longsightedness are usually congenital.

Presbyopia is a defect similar to hyperopia, and usually comes on with advancing years, naturally beginning from the 40th to the 45th year. It is due to diminished focusing power and lessened elasticity of the lens, the result of which is that the image of a near object is not clearly formed on the retina, but is formed behind it, while distant objects are seen as well as ever. Convex lenses are used for remedying this condition.

Strabismus or squinting is a deformity often seen, and is ascribed to want of parallelism in the visual axes when the effort is made to direct both eyes to an object at the same time. It may be due to loss of power (paralysis) of one or more of the eye muscles; and this may depend on a merely local affection, or may be a symptom of serious brain disease. But in the majority of instances and in all ordinary cases no such condition is present. The squint is said to be convergent when the squinting eye is directed toward the nose, and divergent when it is directed toward the temple; the convergent is much the more common. Concomitant strabismus is a variety of which the amount continues about the same in all positions of the fixation-point. When the direction of the eye or eyes is upward or downward the squinting is said to be vertical. Convergent squint usually comes on during childhood, most often from the 2d to the 7th year. It is sometimes due to defective sight in the squinting eye, from congenital abnormality, severe inflammation, or injury; but very often no such condition is present. In a large proportion of cases it is accompanied by

hypermetropia, and is due to the increased effort of accommodation required to see near objects, being associated with an increased and disproportionate effort of convergence. In such cases, if suitable glasses can be worn as soon as the squint begins to show itself, it may be prevented from becoming permanent. In other cases the presence of a squint may be traced to worms, the irritation of teething, etc.; and it disappears when the cause is removed. Divergent squint is very rarely present without considerable defect in the sight of the squinting eye, except where it is the result of over-correction of a convergent squint by operation. It is often associated with myopia, as the other form is with hypermetropia. The surgical operation for the correction of a squint consists in the division of the muscle whose excessive activity leads to the faulty position—in convergent strabismus the internal rectus, in divergent the external. It is often necessary to operate on both eyes in the same manner, even where the squint is monocular. In some cases it is requisite in addition to shorten the opposing muscle. See EYE; OPHTHALMIA; SENSES; VISION.

Vision of Sir Launfal, lān'fal, **The**, a poem by James Russell Lowell, founded on an Arthurian legend and published in 1845.

Vision of Mirza, mēr'za, **The**, a famous allegory by Joseph Addison, which appeared in No. 159 of 'The Spectator.'

Vision of Piers Plowman, pērz plow'man, **The**, an English poem of the 14th century, ascribed, chiefly on the ground of internal evidence, to William Langlande (q.v.) or Longland, a monk of Malvern, in spirit a Carlyle of the Middle Ages, crying out against abuses, insisting upon sincerity as the first of virtues. This poem belongs to the class of the dream-poem, and reflects both the England of the 14th century and the visionary, child-like mediæval mind. Internal evidence fixes its date about 1362. Forty manuscript copies of it, belonging for the most part to the latter end of the 14th century, attest its popularity. Three distinct versions are extant, known as Texts A, B, and C. The probable date of Text A is 1362-3; of Text B, 1376-7; of Text C, 1368-9. The variations in these texts are considerable. An imitation of the poem, called 'Piers Plowman's Crede,' appeared about 1393. The poet's vocabulary is similar to that of Chaucer, and several dialects are combined in it, the Midland dialect dominating. The metre is alliterative, long lines, divided into half-lines by a pause. Each line contains strong, or accented, syllables in fixed number, and weak or unaccented syllables in varying number. Consult Jusserand, 'Piers Plowman: a Contribution to the History of English Mysticism' (1893).

Visitation, in an ecclesiastical sense, the visit of inspection by a bishop, archdeacon, elder or other authority to the churches within his jurisdiction. In the Protestant Episcopal churches the term is applied to an annual assembly of clergy and church-wardens, for the purpose of admitting church-wardens elect to office, reviewing the condition of the parish, answering inquiries relating thereto from the superior ecclesiastical authority, and receiving a charge from the bishop or his representative. Under the church establishment in England, the annual visitation is of an official as well as religious

VISITATION NUNS—VITAL STATISTICS

character, and acts of Parliament bearing on church affairs are then formally communicated to the clergy and laity.

Visitation Nuns. See **ORDERS, RELIGIOUS.**

Visitation, Right of, the act of a naval commander who visits a ship of another nation to ascertain her character, and the object of her voyage. In time of war a search is likely to follow if the replies to inquiries are not satisfactory.

Vistula, vīs'tū-lā (German, *Weichsel*), a river of Central Europe, about 650 miles long, navigable from Cracow. It rises on the frontiers of Galicia and Austrian Silesia, on the northern declivity of the Carpathian Mountains, flows first eastward past the town of Cracow, forming from a point about 15 miles below Cracow, the boundary of Galicia and Poland, till it receives the San on the right bank, when it turns northwest through the Polish provinces, enters West Prussia a little above Thorn, and after traversing that province divides into two branches, of which the eastern, the Nogat, empties into the Frisches Haff; the western divides again about five miles from the Baltic into an eastern and a western branch, the latter, the Dantzig Vistula (which is much the larger), proceeding toward Dantzig, the former to the Frisches Haff. A new channel cut since 1895 from the head of the Dantzig branch now carries most of the water directly to the Baltic. The navigation of this river is important, especially to Poland, though often obstructed by ice or shallow water. The canal of Bromberg connects the Vistula, through the Netz and Warthe, with the Oder. Several navigable rivers empty into it. The area of its basin is about 76,000 square miles.

Vita Nuova, vē'tā noo-ō'vā (It. 'The New Life'), an early work by Dante, completed most probably in 1307.

Vital Statistics may be defined as the science of numbers applied to the life history of populations. The term "demography" is nearly synonymous with vital statistics. The principal factors which are concerned in the study of vital statistics are the number of the population, and the number of births, marriages and deaths which occur in such population. To these may be added statistics relative to the prevalence of disease. The facts which are collected from different nations, communities, and populations, and which are embraced in the term "vital statistics" constitute the basis of definite and accurate knowledge upon many of the fundamental principles of public hygiene, sociology, and of preventive as well as of therapeutic medicine. Among the important data which are contributory to the vital statistics of a community are the age, sex, time of year, race, occupation, and the cause of death. Vital statistics also furnish the necessary data for life-insurance calculations.

Population.—Knowledge of the number of the population living in a given community is essential to accuracy of conclusions as to the vital statistics of such community. For example, the intensity of the birth- or death-rate of a district cannot be compared with that of another district, unless the number of the population living in each is known with a fair degree of accuracy. The number of the population living in a given community is determined by a census or counting of the people. In most coun-

tries this is performed once in ten years, but for the sake of greater accuracy, in some of the United States, an intermediate or five-year census is taken. Various methods are employed to estimate the number of the population in intercensal years. The method employed by the registrar-general of England, and by many other authorities, assumes that the same rate of increase has prevailed as that which existed between the two immediately preceding census enumerations. This geometric rate is practically the same as is employed in computing compound interest, and assumes that the population increases, and that the increase increases at the same rate. The arithmetical method assumes that a fixed and definite addition is made to the population in each year. Either of these principles may be applied to decreasing as well as to increasing populations.

The following formula will be found useful for computing populations in intercensal years:

Let P = population in a census year 1890.

Let P^1 = population in a census year 1900.

Let R = rate of increase.

Then $P^1 = P + R^{10}$ in the 10th year following.

If we begin with population P , the population at any following year = $P(1 + r)^n$.

$\log P^1 = \log P + 10 \log R$.

$1/10(\log P^1 - \log P) = \log R$.

Application:—A city of 500,000 has increased to 595,430 in the ten year period 1890-1900: what is its estimated population in 1905?

$\log 595,430 = .7748307$

$\log 500,000 = .6989700$

$\frac{.7748307 - .6989700}{10} = .0075861 = \log R$.

$\log P \text{ 1905} = .7748307 + 5(.0075861) = .8127610 = \log \text{ of } 649,772 = \text{estimated population of city in 1905.}$

In a city or a country like New Zealand, or the city of Berlin, where a strict account of births and deaths is kept, together with the number of immigrants and emigrants, the population can readily be found by balancing the natural increase due to the excess of births over deaths, and the increase or decrease due to migration.

Registration of Births, Marriages, and Deaths.—Records of births, marriages and deaths are now compulsory in most European countries, and in some of the States of the Union. The States having such registration are the six New England States, New Jersey, Michigan, and New York. Other States are also preparing for similar work. Massachusetts was the first State to adopt a complete system of registration in 1842. The census bureau at Washington and the American Public Health Association have also taken a lively interest in aiding and forwarding this work.

Registration of Disease and Sickness.—In some countries and States, and in most cities, registration of certain infectious diseases which are dangerous to the public health is compulsory, and by this means information is gained as to the spread of such diseases, and as to their fatality. This is accomplished by a system of notification to the health authorities.

Births, Marriages, and Deaths are commonly stated as a rate per thousand of the living population. In the case of *births* a more accurate result would be attained by comparing the

VITAL STATISTICS

births with the number of women of child-bearing years. If it be desired to make a further classification the legitimate births may be compared with the number of married women of child-bearing years (15-45), and the illegitimate births with the unmarried women of the same ages. The birth-rate varies in different countries from as high as 45 per 1,000 inhabitants in Hungary to as low as 22 in France. Several countries in Eastern Canada occasionally have birth-rates as high as 55-60 per 1,000 inhabitants. The birth rate of the New England States for the 10 years 1892-1901 was 24.7 per 1,000, the maximum for the same period being that of Massachusetts (27.1), and the minimum that of New Hampshire (20.5). The birth-rate has diminished in most countries having registration, that of England having fallen from 36.3 per 1,000 in 1876 to 28.4 in 1903. The causes as stated by Newsholme, being the "postponement of marriage to more mature years," "a larger proportion of celibacy" and mainly by "the deliberate and voluntary avoidance of child-bearing on the part of a steadily increasing number of married persons." The births of males are in most countries from 4 to 7 per cent greater than those of females.

Still-births are usually excluded from the birth-rate, since they add nothing to the living population. They are also excluded from the death-rate. Still-births are usually from 2.5 to 4 per cent of all births. The still-born males are about 50 per cent greater in number than the still-born females.

Plural Births.—The ratio of plural births in different countries is fairly constant; when large numbers are considered. During the 10 years 1874-83, in seven large countries of Europe (France, Italy, Austria, Prussia, Bavaria, Switzerland and Sweden) in 20,000,000 births the cases of twins were about 12,000 per 1,000,000, and those of triplets about 140 per 1,000,000.

Marriages.—Marriages are usually stated numerically as a ratio per 1,000 of the total population, for example, 9.5 per 1,000, which is also equivalent to 19 persons married per 1,000, the number of persons married being twice the number of the marriages. A more accurate method would be to reckon the marriage-rate as a ratio of the number of unmarried persons living, of marriageable ages. The marriage-rate is usually higher in the cities than it is in the rural districts. Conditions which affect the marriage-rate are: (1) High or low cost of living; (2) Unequal distribution of the sexes at marriageable ages; and (3) Prolonged war.

Deaths.—The death-rate is also usually stated as a ratio of the living population, the unit of time being a year. This unit is employed when death-rates for shorter periods are stated. In many large cities a weekly or monthly bulletin is issued in which monthly or weekly death-rates are given; they represent the number who would die out of each 1,000 of the population, supposing the same ratio of deaths to continue throughout the year. The following formula may be used for obtaining this weekly annual death-rate. The approximate number of weeks in a year being 52.18, if the population of a city is 250,000 and the number of deaths in a given week is 85 then the death-rate may be obtained as follows:

$$\frac{250,000}{52.18} = 4791; \quad \frac{1000}{4791} = .2087 =$$

the factor by which the weekly number of deaths must be multiplied for a city of 250,000.

Then $85 \times .2087 = 17.74 =$ death-rate of the week.

Correction of the Death-rate.—The death-rate of a city is obtained by taking the ratio of the deaths to the population; but, in many cities there are large institutions in which many deaths occur of persons who are not residents of such cities. There are also deaths of residents which occur in other places, while the persons are away from home. Correction should be made for such deaths. For example, in 1902, 600 persons died in institutions of Boston who were not residents, and their deaths should be credited to their proper places of residence. Again, the relative numbers of the population at each age differ much in different cities, and this fact materially influences the death-rate. If there is a large percentage of persons at the ages of 15 to 50 when the death-rate is not above 8 or 9 per thousand, then the general death-rate will be low, but if there is an excess of children under 5 and of old persons over 70 then the general death-rate will be high, other conditions being equal. It is customary in English cities to make corrections for these conditions, using the death-rate of the country at different ages as a standard of comparison.

Age and Sex.—The death-rate differs at different ages, as well as for the two sexes. The following table shows the death-rate by ages and sexes for England and for Massachusetts:

Ages	Males		Females	
	England 1899	Mass. 1893-7	England 1899	Mass. 1893-7
0-5	60.4	60.1	50.7	52.2
5-10	3.8	5.7	3.9	5.8
10-15	2.3	3.1	2.3	3.4
15-20	3.6	5.3	3.3	5.7
20-25	5.3	7.5	4.3	7.3
25-35	7.1	9.3	6.1	8.8
35-45	12.3	11.2	10.0	10.7
45-55	20.0	16.7	15.4	14.9
55-65	37.2	30.4	20.8	26.0
65-75	60.8	59.7	61.5	51.4
75-85	152.6	127.0	142.6	109.0
All over 85	300.3	253.8	272.0	230.0
All ages	19.5	20.1	17.3	18.4

Infant Mortality.—The death-rate of infants under one year old is usually expressed for the sake of accuracy as a ratio of the births. Infant mortality varies under different conditions from as low as 90 per 1,000 births up to 300 or more in different countries.

The infantile death-rate of manufacturing cities, and especially of those which have a densely crowded tenement-house population, is greater than that of other cities, while that of rural districts is comparatively low. The infantile death-rate of the densely settled State of Rhode Island in the 10 years 1892-1901 was 165, while that of the more sparsely settled State of Maine in the same period was only 120.

The following table presents the infant mortality of certain countries for different periods:

VITAL STATISTICS

DEATHS UNDER 1 YEAR PER 1,000 BIRTHS.

COUNTRIES	Years	Infant Mortality
Ireland	1884-88	94
Sweden	1881-90	97
Scotland	1885-90	120
England	1885-91	144
Belgium	1881-91	159
France	1885-90	165

Density of Population.—Density has a decided effect upon the general death-rate; other things being equal, the greater the density, the higher the death-rate. Dr. Farr found that the death-rate varied, not in direct proportion, but in proportion to the sixth root of the different densities. When applied to English, and American urban populations at the present day, however, this rule does not hold good. In English cities, during the past 50 years the death-rate appears to have gradually diminished, while the density has increased, thus showing that counter-acting sanitary influences have had an appreciable effect. Newsholme states that the true density is the number of persons to each room, not the number on a given area.

Effect of Occupation.—The mean age at death is not a trustworthy index of the effect of occupations upon health. For example, if a large number of employees in some industry is thrown out of employment by a strike or lock-out, and their places are filled by younger persons at lower wages, it is plain that the mean age at death of the latter group will be less than that of the former group, independently of sanitary conditions. So the mean age at death of judges is greater than that of law students, since judges are not usually appointed until after middle life. The only trustworthy method is to compare the mortality of those engaged in one occupation, and of a given age with the mortality of those engaged in other occupations, and of corresponding ages. The adoption of a "comparative mortality figure" renders the comparison more intelligible. This method is adopted by the registrar-general of England in the Supplement to his 55th Annual Report, from which the following figures are taken. These are for the years 1890-92, and are based upon the four age groups 25-35, 35-45, 45-55, 55-65 years.

COMPARATIVE MORTALITY FIGURES OF MALES FROM 25 TO 65 YEARS OF AGE, ENGAGED IN DIFFERENT OCCUPATIONS.

Occupation	Comparative mortality figures	Occupation	Comparative mortality figures
All males	1,000	Agricultural laborers	666
Males in selected healthy districts...	679	Coal miners.....	727
Occupied males.....	953	Artists, engineers, and architects...	778
Unoccupied males...2,215		Carpenters	783
Clergymen	533	Lawyers	821
Gardeners and nurserymen	553	Fishermen	845
Farmers	563	Physicians	966
Teachers	604	Tailors	989
Grocers	664	Woolen mill operatives	996

Masons and bricklayers	1,001	Slaters	1,322
Law clerks	1,070	Steel grinders.....	1,412
Butchers	1,096	Brewers	1,427
Printers	1,096	Inn keepers and hotel servants...	1,659
Plumbers and painters	1,120	Potters and earthenware makers...	1,706
Cotton mill operatives	1,176	File makers.....	1,810

The foregoing table should be read as follows: The same number of men aged 25-65 that would give 1,000 deaths among all males, would give 533 among the clergy, 563 among farmers, 843 among lawyers, 966 among physicians, 1,659 among innkeepers, and 1,810 among file makers. The comparatively high mortality among the unoccupied is doubtless due to the fact that the bulk of this class consists of those who are physically feeble and unfit for employment of any kind, and as fast as these are eliminated by a high death-rate, their places are filled by recruits from the ranks of the employed class. Examining the figures more specifically with regard to the diseases to which persons employed in certain occupations are liable,—cancer appears to cause a high mortality among chimney sweeps; diseases of the nervous system among brewers, innkeepers, file makers, and lead workers, bronchitis among steel grinders, glass-blowers, manufacturing chemists and potters; lead poisoning among potters, file makers, and lead-workers, accidents among railway employees, coal miners, and seamen. The effects of breathing dust laden air are manifest among quarrymen, copper and zinc workers, file makers, tin miners, cutlers and scissors grinders, potters and earthenware makers, in the mortality from phthisis; of alcoholic excess from the different diseases which attack the viscera of the body, the highest mortality from these causes (diseases of the liver, nervous system, the urinary organs and gout) being found among brewers, inn servants, and innkeepers who are most exposed to the evil effects of alcoholic excess.

The Causes of Death.—The causes of death are usually stated either as a ratio of the mortality from all causes, or as a definite proportion of the living population. The latter is the better method when the number of the population and of each specific cause is known with a fair degree of accuracy. In the following table the mortality in England and in Massachusetts from certain diseases is presented for the year 1900 by both methods. The figures for Massachusetts are for the cities and towns having over 5,000 in each, which comprise four fifths of the entire population.

DEATH RATES FROM CERTAIN CAUSES IN ENGLAND AND MASSACHUSETTS, 1900.

	Death rates per 10,000 of the population		Deaths per 1,000 of the total mortality	
	England	Mass.	England	Mass.

VITAL STATISTICS

Life-tables.—Life-tables offer an accurate means of measuring the probabilities of life and death. They represent "a generation of individuals passing through time." The data which are required for the construction of a life-table are the number and ages of the living, and the number and ages of the dying. (1) Theoretically, the best plan for forming a life-table would be to observe a definite number of children, say 100,000 or 1,000,000, all born at the same time, throughout life, entering in a column the number who remain alive at the end of each successive year until all are dead. In a second column the number dying before the completion of each year of life is also entered opposite the corresponding age in the first column. The number who die under one year of age is placed in the column opposite the age 0 and so on. This method being impracticable, it becomes necessary to resort to other and shorter methods. (2) If any large number of children could be traced through life, however various the dates of their birth, a life-table could be constructed from the data thus observed, if the numbers of the living and dying in each year of life are known. (3) The mortality experience of a single year may be exceptional, hence it is customary to take the experience of a series of years, five or ten, for example, as is usually done in constructing the English life-tables. The numbers of children of each sex at birth are not equal, hence it is customary to start with the proportionate number of each sex actually born. For example, in a city of 1,000,000 inhabitants in the 10 years 1890-1900 there were 300,000 living births or 30 per 1,000 annually, but the numbers of each sex were 152,460 males and 147,540 females, or in the ratio of 50,820 males and 49,180 females, these two combined making 100,000. Dr. Newsholme describes the method of construction of his life-table as follows, in his second Brighton life-table published at Brighton, England, in 1903:

Knowing the number living and dying in each year of life the probability of living one year is represented for each year of life except the first by the fraction

$$\frac{\text{number of survivors at end of year.}}{\text{number of living at beginning of year.}}$$

The deaths in the first year are very unequally distributed. Out of 3,036 male deaths under one year of age in Brighton in 1891-1900, 2,142 occurred in the first and 894 in the second half year. The probability for the first year of life is obtained by dividing the mean population minus the deaths in the second six months of life, by the mean population plus the deaths in the first six months. Thus for males:

$$p_0 = \frac{P_0 - 894}{P_0 + 2142} = .83194. \quad \text{Here } p = \text{probability}$$

of living one year and P = population or years of life at each age.

Having found the probability of living one year separately for the two sexes at each age, the life-table is now built up step by step, starting with 100,000 children at birth. In Brighton in 1891-1900 the births were in the ratio of 50,614 males to 49,386 females, making 100,000 of both sexes. These numbers are taken as the number living at age 0. The number of male

infants living at the end of a year is obtained by multiplying 50,614 by the probability of living to the end of the first year. $50,614 \times .83194 = 42,108$ and for the second year $42,108 \times .95213 = 40,092$ and so on. The probability of living one year is the best method of stating the immediate prospects of life. The number surviving at any given age is determined by the probabilities of living a year during all preceding ages. To ascertain the future prospects of life for each sex (mean expectation of life) we must find the total number of years lived by the 50,614 male, and 49,386 female children, and divide this sum by the number living this total number of years. The 42,108 male children surviving at the end of the first year of life out of 50,614 born are reduced by death to 40,092 at the end of the second year. After the first year, the deaths may be assumed to be evenly distributed throughout the year and hence the number of survivors at the middle of the second year, or the average number of persons alive during the year, may be considered as the mean between 42,108 and 40,092 or 41,100. This number is termed P . It is evident that the number of years of life lived between ages 1 and 2 by the 42,108 males entering the second year of life must equal the average number living during the year or 41,100. So during the third year the 40,092 males entering the year live 39,660 years and so on. Hence the 50,614 born live a total of $45,196 + 41,100 + 39,660 + 38,967 + \dots + 11 + 6 + 2 + 1 = 2,272,668$ years until the last survivor dies. This total, termed Q_0 and Q_1 , is similarly the total number of years lived by the 42,108 males surviving at age 1 and so on. The average life-time of each male born is thus

$$\frac{2,272,668}{50,614} \text{ or } \frac{Q_0}{l_0} = E_0; \text{ and generally } E_x \text{ or the average future life-time or expectation of life at any age } x = \frac{Q_x}{l_x}.$$

BRIGHTON LIFE-TABLE. MALES. (CONDENSED.)

A life-table similarly constructed for Massachusetts upon the mortality of the five years 1893-7 gave the following results for the first years of life:

VITAL STATISTICS

MALES.

AGE	Dying in each year of age	Born and surviving at each age	Population or years of life lived in each year of age	Years of life lived in and above each year of age	Expectation of life at each year of age
x	d _x	l _x	P _x	Q _x	E _x
0	8,849	51,350	46,343	2,263,907	44.09
1	1,794	42,501	41,604	2,217,564	52.18
2	818	40,707	40,298	2,175,960	53.48
3	559	39,889	39,609	2,135,662	53.54
4	424	39,330	39,118	2,096,053	53.29
5	316	38,906	38,748	2,056,935	52.87

The foregoing analytical method requires much calculation and interpolation of figures at the intervening years between ages 10, 20, 30, etc. A convenient and fairly accurate method of constructing a life table is the graphic method described by Newsholme, in which the data are represented for the population and deaths upon sheets of cross section paper. Upon the population sheet the numbers living at each age group are represented by parallelograms, in which the heights of the ordinates from the base line represent the numbers living for each year of life. Upon the other sheet the deaths are shown in like manner. The lines representing the population and the deaths are drawn by connecting the middle points at the tops of the parallelograms. The conditions which affect the accuracy of life-tables are chiefly the effect of migration, the defects of the census, the practice of incorrectly reporting the ages of the living and the dead, and defects in the registration of births and deaths. To remedy these defects, especially in instances where life-tables are constructed from the data of small towns or groups of population, the system of interpolation already referred to becomes necessary for the correction of inaccuracies.

STATISTICAL FALLACIES.

Errors from Paucity of Data.—These often occur in writings where statistics are employed. A small number of observations is not sufficient to establish a conclusion. The degree of approximation to the truth may be estimated by means of Poisson's formula, as follows:

a = the total number of cases observed in two groups.

m = the number in one group.

n = the number in the other group.

Hence $a = m + n$.

The extent of variation in the proportion of each group to the whole will vary within the

proportions represented by $\frac{m}{a} + 2\sqrt{\frac{2mn}{a^3}}$ and

$\frac{n}{a} - 2\sqrt{\frac{2mn}{a^3}}$

The larger the number of the total observations

(a) the less will be the value of $2\sqrt{\frac{2mn}{a^3}}$

and the less will be the limits of error in the

simple proportion $\frac{m}{a}$.

Thus, out of 200 cases of diphtheria 22 died, a fatality of 11 per cent. The possible error is determined by the second half of above formula:

$$2\sqrt{\frac{2 \times 22 \times 178}{200^3}} = 2\sqrt{\frac{7832}{8,000,000}} = 0.0623$$

that is, the possibility of error = 0.0623 of unity or 6.23 per cent. In other words, in a second series of cases of diphtheria under the same conditions as the foregoing, the fatality may vary from 4.77 to 17.23 per cent, an indefinite result which indicates that the first series cannot be depended upon as establishing more than a *prima facie* case in favor of any special treatment that may have been adopted. If 20,000 cases and 2,200 deaths had been observed the limits of error would have been comparatively small. An illustration of this point may be found in the 'Medical and Surgical History of the War of the Rebellion,' where it is stated that the observed fatality of sabre wounds penetrating the abdominal cavity without injuring the viscera was 100 per cent, while the fatality of sabre wounds penetrating the pelvis was 0 per cent. But the actual number involved in each case was only one. As they stand these observed facts have absolutely no value. Had the number of observed facts been 100 or 1,000 these percentages would undoubtedly have been very much modified. The steady decrease in the limits of possible error as the number of recorded facts increases is shown in the following table, where, in the first line there are 7 recoveries (70 per cent) out of 10 cases, and in the last line 700,000 out of 1,000,000 cases. In the first instance the fallacy of drawing conclusions from a small number of cases is shown, since the possible recoveries are actually greater than the whole number of cases.

Total number of cases	Number of recoveries	Possible number recovering out of 100,000 cases according to Poisson's formula
10	7	29,020 or 110,080
100	70	57,000 or 73,000
1,000	700	66,000 or 74,000
10,000	7,000	68,700 or 71,300
100,000	70,000	69,600 or 70,400
1,000,000	700,000	69,870 or 70,130

Errors from Incomparability of Data.—The data to be compared should be strictly comparable. The conclusion that a certain remedy or method is valuable in the treatment of certain diseases is not demonstrated by the fact that the fatality in a series of cases treated with this remedy is 5 per cent while in another series of cases treated without it, the fatality is 20 per cent, unless it is shown that the ages, and other previous conditions of the patients in the two cases are not widely different, and unless the numbers constituting the series are sufficiently great to avoid the fallacy due to paucity of data.

Errors from the Composition of Rates.—These are very common and show the fallacy of dealing with average rates by any method different from that of dealing with the sums of the numbers compared. For example, a certain county is made up of four municipalities, a, b, c, and d. The death rate of a in 1900 was 20.81,

VITAL STATISTICS

PRINCIPAL VITAL STATISTICS OF THE SIX NEW ENGLAND STATES (FOR THE 10 YEARS 1892-1901).

The figures under the name of each State are the estimated mean annual populations of these States for the 10 year period.

	Maine 682,655		New Hampshire 399,101		Vermont 339,101		Massachusetts 2,595,106		Rhode Island 398,195		Connecticut 849,356		New England 5,263,514

In the foregoing table for the sake of greater accuracy, the deaths under one year are compared with the registered births, not with the population.

INTERNATIONAL VITAL STATISTICS.

(Births and deaths per 1,000 living, in European countries, in the 25 years 1876-1900, and in the year 1901.)

	England and Wales	Scotland	Ireland	Denmark	Norway	Sweden	Austria	Hungary	Switzerland	German Empire	Holland	Belgium	France	Spain	Italy
Births per 1,000 living.	32.0	32.0	23.7	31.3	30.7	28.6	37.9	42.7	28.7	37.0	34.0	30.0	23.5	35.5	36.5
Average of 25 years 1876-1900.	28.5	29.5	22.7	29.9	29.8	26.8	36.9	37.8	29.1	35.7	32.3	29.4	22.0	34.7	32.6
Deaths per 1,000 living.	19.1	19.2	18.2	18.3	16.6	17.0	28.6	32.3	20.6	24.2	20.3	20.1	21.9	30.3	26.5
1876-1900.	16.9	17.9	17.8	15.8	14.9	16.0	24.2	25.4	18.0	20.7	17.2	17.1	20.1	27.6	22.0

VITASCOPE — VITEBSK

that of b was 19.02, that of c. 14.14, and that of d 7.59. If these are averaged as follows:

20.81	the resulting death-
19.02	rate of the county ap-
14.14	pears to be 15.39. The
7.59	only correct way of
4)61.56	obtaining the combined
	death rate of the
	county is as follows:
15.39	

MUNICIPALITIES	Population	Deaths in 1900
a.	560,892	11,671
b.	34,072	648
c.	10,395	147
d.	6,058	46
	611,417	12,512

Therefore, $\frac{12,512 \times 1000}{611,417} = 20.46$ per 1000,

the true death-rate of the county. The error in the first instance arises from the fact that the larger city, with over 93 per cent of the total population, and the small town, with less than 1 per cent, are each given equal prominence in obtaining the result.

Errors from Stating Deaths as a Ratio of the Total Mortality.—There is nothing erroneous *per se* in stating the deaths from any special cause, or at any age, as a percentage of the total mortality from all causes or at all ages. It is a useful, and, in fact, the only method practicable when it becomes necessary to state the proportion of one of them to the other. But beyond this the method is untrustworthy. For example, the proportion of fatal accidents in Massachusetts in 1900 among boys under five years of age was 14.5 per cent of all fatal accidents among males, and that of girls of the same age was 24.3 per cent of all fatal accidents of females. From these figures, however, it cannot be inferred that girls are more liable to fatal accidents than boys, since the contrary is the fact, the actual numbers being 205 such deaths among boys under five, and 126 among girls of the same age. The only reasonable conclusion is that at higher ages females are much less subject to fatal accidents than males. When stated as a ratio of the living population of the same ages, the deaths by accidents of boys under five were 14 per 10,000, and those of girls of the same age were only 9 per 10,000.

Vital Statistics as Tests of Sanitary Conditions.—(1) The most commonly applied test for determining the comparative healthfulness of different communities is the general death-rate. This test, however, has certain limitations. It may be trusted for comparing the health of a city, town, or district for any given year with that of the same community for a preceding year or period. But if employed for comparison with the death-rates of other places there is great liability to error.

(a.) Because of differences in the age and sex constitution of the places compared with each other. The error may be corrected by referring the figures of each place to a common standard.

(b.) Correction should be made for deaths in public and private institutions of persons other than residents. For example, in a small town in 1900 having a population of 3,683, the deaths were 453,

making the enormous death-rate of 123 per 1,000 of the population. But 402 of these deaths occurred in a large institution, leaving a death-rate of about 19 per 1,000 for the town outside the institution.

(c.) Occupation and social condition have a decided effect on the death-rate. In two manufacturing districts, in one of which the wages are high, and in the other comparatively low, the death-rate of the well-paid population will usually be the lower, other conditions being equal.

(2) The death-rate from the principal infectious diseases is often quoted as an index of sanitary conditions. In consequence of the different methods by which such diseases are spread, the modes of prevention also differ, and are more easily applied in some diseases than they are in others. For example, a high death-rate from typhoid fever in a city or a town would indicate a greater neglect of sanitary precautions than a high death-rate from influenza.

(3) Infant mortality constitutes a delicate test of sanitary conditions, but should not be quoted as the only test. It should always be stated as a proportion of the births, and not as a proportion of the persons living under one year according to the census, since the latter is exceedingly liable to error.

(4) A more exact method is to construct a life-table, by which the expectation of life may be compared in different districts, as well as among the different classes of the population. Life-tables published in England for different districts and different classes of people show marked differences, according to the varying conditions in which such classes of the population are living.

In the two tables herewith the following figures are presented: (1) The principal vital statistics of the New England States for the 10 years, 1892-1901. (2) The births and death-rates of fifteen European countries.

Bibliography.—Newsholme, 'Elements of Vital Statistics' (1899); Farr, 'English Life Table' (1864); Longstaff, 'Studies in Statistics' (1891); Annual Reports of the Registrar-Generals of England, Scotland and Ireland; Rumsey, 'Some Fallacies of Statistics' (1875); United States Census Reports of Mortality (1880, 1890, and 1900); Registration Reports of New England States, Michigan, New York, and New Jersey; Bulletin de l'Institut International de Statistique; Statistica delle cause di morte Rome (1901); Böckh, 'Statistisches Jahrbuch der Stadt Berlin' (1880-1902); Körosi, 'Statistisches Jahrbuch der Stadt Budapesth' (1900); Billings, 'The Cartwright Lectures' (1889).

SAMUEL W. ABBOTT,

State Board of Health, Boston, Mass.

Vitascope. See BIOGRAPH.

Vitebsk, vē-těbsk', West Russia, (1) the capital of a province of the same name, on both sides of the Duna, 79½ miles by rail northwest of Smolensk. It has more than 30 churches, including six Roman Catholic, two synagogues, an old palace, a theatre, a gymnasium, and a hospital, manufactures of mead and leather, and an active transit trade. Pop. (1897) 65,871.

(2) A western province surrounded by Pskov, Smolensk, Mohilev, Minsk, Vilna, Courland, and Livonia; area, 17,440 square miles. The surface is in general hilly; in the depressions are numerous marshes and more than 2,500 lakes, of which the largest are Lubahan, Rasno, Nevel, Sebes, and Osvea. The chief rivers are the

VITELLIUS — VITRIFIED FORTS

Duna, Mesha, Kasplja, Ulla, Drissa, and Evst. The soil is far from fertile, and the harvests, except under the most favorable conditions, are insufficient for the wants of the population. The principal occupations are agriculture, cattle rearing, hunting, and fishing, besides tanning, weaving, and the manufacture of brandy and tobacco. Flax, linseed, hides, building timber, and fancy wares are exported. Pop. (1897) 1,502,916.

Vitellius, vī-tē'l'ūs, **Aulus**, Roman emperor: b. Rome 24 Sept. 15 A.D.; d. there 22 Dec. 69 A.D. He gained the favor of Tiberius, Caligula, Claudius, and Nero in turn, though he was possessed of neither ability nor ambition, being a man of profligate character and a glutton. In 68 he was sent by Galba to command the legions in Germany, was proclaimed emperor in January 69 by his troops, who murdered Galba, and in July 69 he entered Rome as emperor. He was noted for gluttony and other excesses, spending enormous sums for these purposes, and made no preparation to meet the forces of Vespasian, who had been proclaimed emperor by the troops in the East and was advancing upon Rome. His army proved indifferent to his fate, he was dragged from the palace by a common soldier, and put to death in the Forum.

Viterbo, vē-tēr'bō, Italy, an episcopal city in a beautiful and fertile valley in the province of Rome, 40 miles northwest of the city of Rome. The chief edifices are a Gothic cathedral containing the tombs of four popes and numerous fine paintings; an ancient and dilapidated episcopal palace; the Palazzo Pubblico, etc. The trade is chiefly in sulphur and iron. About two miles from the city are the celebrated sulphur baths of Viterbo. Viterbo was the chief town of the allodial possessions of the Countess Matilda, which were given by her to the popes, and formed part of the patrimony of Saint Peter. Pop. (1901) 21,202.

Vitet, vē'ta, **Louis**, French author: b. Paris 18 Oct. 1802; d. there 5 June 1873. He became a journalist and litterateur and in 1830-51 also held various posts in the French civil service. From 1871 he was representative of Seine-Inférieure in the National Assembly, being elected vice-president of the assembly in Feb. 1871. In 1845 he was chosen to the Academy. He published four dramatic poems dealing with French history, 'Les Barricades' (1826); 'Etats des Blois' (1827); 'La Mort de Henri III.' (1829); and 'La Ligue' (1844). But his chief works are in prose, and largely historical in character. Among them are: 'Fragments et Mélanges' (1846); 'Essais Historiques et Littéraires' (1862); 'Études sur l'Histoire de l'Art' (1864); 'Lettres sur le Siège de Paris' (1871); 'Études Philosophiques et Littéraires' (1874); and 'Le Comte Duchatel' (1875). Consult the notice by Guizot in the posthumous 'Études Philosophiques et Littéraires' (1874).

Vitex, a genus of trees or shrubs belonging to the *Verbenaceae*, and widely distributed in warm climates. The leaves are opposite, and are usually palmately compound with 3 to 7 leaflets. The flowers are of medium size, with a short tube, and oblique, five-cleft limb, which is sometimes slightly labiate. They are arranged in more or less dense and branched cymes, and are purple, blue, white or yellowish in hue. The handsome, deciduous shrub *Vitex agnus-castus*, native to the shores of the

Mediterranean, has many popular names, such as Abraham's balm, or monk's pepper-tree, but is particularly known as the chaste-tree, or agnus-castus, from its supposititious virtues in the way of dispelling love, and preserving virtue. Its leaves are aromatic, its sap is said to be poisonous, and it is much cultivated on account of the paniculate cymes of bright, bluish-purple flowers; it is not hardy, however, north of Philadelphia.

Several species of *Vitex* produce valuable wood, as, for instance, the lignum-vitæ of Queensland (*V. lignum-vitæ*), and the puriri, or New Zealand teak from *V. littoralis*. This last is a robust tree, sometimes five feet in diameter, yielding short lengths, often curved, of a brown, heavy, durable timber, suitable for shipbuilding and for other purposes, and considered to be imperishable in water. The flowers on its spreading branches are nearly an inch long, and are hairy, and dull-red in color. *V. capitata* is the bois lézard of upper South America. The evergreen *V. pubescens*, and the *V. umbrosa*, of the West Indies, are known respectively as the tree-vitex, and as the boxwood or fiddle-wood. *V. trifolia* is known in India as the wild pepper-tree, and yields a sweet, greenish medicinal oil. The aromatic leaves of the *V. negundo*, of the same country, are believed to alleviate headache, and a vapor bath is prepared from them for the benefit of fever and rheumatism; while its ashes are largely employed as an alkali in dyeing.

Viticulture. See GRAPE CULTURE; WINE; WINE-MAKING.

Vitoria, vē-tō'rē-ā, Spain, an episcopal city, capital of the province of Alava, situated on a height overlooking an extensive plain watered by the Zadorra, 65 miles northeast of Burgos. The old parts of the town are poorly built, but the new town is well laid out in spacious streets and squares and is electrically lighted. The principal buildings and establishments are the 12th century fortress-cathedral, three other churches, one of them adorned with a fine altar-piece by Velazquez, a handsome modern palace of deputies, an academy of music, theatre and prison. The chief manufactures are furniture, candles and articles in leather. There is a brisk trade, especially in steel and iron, grain and wine, as well as in the manufactures mentioned. It was the scene of two battles, the first fought in 1367, in which the Black Prince gained a victory for Pedro the Cruel; the second on 21 June 1813, in which the Duke of Wellington concluded his series of great Peninsular victories, defeating the French under King Joseph and Marshal Jourdan. Pop. (1900) 32,617.

Vitreous Rocks, volcanic rocks with a glassy texture, due to rapid cooling which prevented the crystallization of the magma. They are comparable to the glassy slag of furnaces. They break with a conchoidal fracture, and are dark undercrossed nicols. The chief volcanic glasses are obsidian, perlite, and pitchstone (qq.v.). Pumice is a cellular variety, which is represented by the frothy slag of blast furnaces.

Vitrified Forts, the name given to certain prehistoric hill fortresses principally found in Scotland, and formed of stones heaped together. The materials of which they are constructed are perfectly or partially vitrified or transformed into a kind of glass by the action of heat. It is

VITRIOL — VIVIANITE

now generally believed that the vitrification was intentional, being effected by means of piled-up fuel.

Vitriol, a common name for ordinary commercial sulphuric acid and for certain salts derived from it. Ordinary concentrated sulphuric acid is more specifically known as oil of vitriol; sulphate of iron or copperas is green vitriol; sulphate of copper or blue stone is blue vitriol; sulphate of zinc, white vitriol. A dilute sweet aromatic solution of pure sulphuric acid is known in medicine as elixir of vitriol.

Vitriol, Oil of, or Vitriolic Acid, a name once applied to sulphuric acid (q.v.).

Vitruvius, Pollio, *vī-trōo'vī-ūs pōl'i-ō*, **Marcus**, Roman architect and military engineer, supposed to have flourished in the time of Julius Caesar and Augustus, but of whose parentage and place of nativity no certain knowledge is obtainable. The most probable opinion is, that he was born at Formia, a city of Campania, now called Mola di Gaeta. The Veronese, however, claim him as a fellow citizen, and have erected a monument to his memory. He appears to have been liberally educated; and that he traveled for information and improvement, we learn from his writings. The only public edifice which he mentions as constructed from his designs is a basilica at Fanum Fortunæ (now Fano) in Umbria. He wrote at an advanced age his work 'De Architectura Libri Decem,' dedicated to the emperor (without doubt, Augustus, although he is not named). This treatise, valuable as a compendium of those of numerous Greek architects, was first printed at Rome about 1486; and among modern editions, the most valuable are those of Schneider (1808); Stratico (1825-30); and Rose and Müller-Strubing (1867), with index by Nohl (1876). An English translation, with commentary by William Newton, appeared in 1771, re-published 1791, and a new translation by W. Wilkins, with an 'Introduction, containing an Historical View of the Rise and Progress of Architecture among the Greeks,' in 1812-17.

Vittoria Colonna, *vē-tō'rē ä kō-lōn'nä*. See COLONNA VITTORIA.

Vittorio, *vīt-tō'rē-ō*, Italy, a city of the province of Treviso, formed in 1879 by the incorporation of the episcopal see of CENEDA and the town of SERRAVALLE, situated at the entrance of Santa Croce Valley 26 miles by rail north of Treviso. The chief features are an ancient citadel and a cathedral. Mineral springs make Vittorio a favorite health resort. It has silk industries, and manufactures of textiles, paper, etc. Pop. (1901) 18,969.

Vīt'us, Saint, a name which appears in the martyrologies as belonging to a certain Christian who suffered under Diocletian. He owed his conversion to the teaching of a pious nurse Crescentia and her husband, Modestus. His festival is set in the Roman calendar on 15 June. As a saint of succor he is invoked for protection against sudden death, and against many diseases and distempers, notably chorea, which is commonly called Saint Vitus's dance.

Vivandière, *vē-vān-dē-ār*, in the French army, a girl or woman who sells provisions and liquor. The dress of the vivandières is generally a modification of that of the regiment to which they are attached.

Vivarini, vē-vā-rē'nē, Antonio, styled also ANTONIO DA MURANO, Italian painter: b. Murano about 1410; d. about 1470. He painted between 1440 and 1446 with Johannes Alemannus, and their work is signed 'Joannes et Antonius de Muriano fecerunt.' After 1450 Antonio painted with his brother Bartolommeo, and an altarpiece signed by them is in the Pinacoteca at Bologna. One of Antonio's finest works is an altarpiece, dated 1446, and now in the Venetian Academy. At the Lateran in Rome is an altarpiece, the work of Antonio alone, and the Berlin Museum contains his 'Adoration of the Kings.'

Vivarini, Bartolommeo, *bār-tō-lō-mā'ō*, Italian painter, brother of Antonio Vivarini: b. Murano; d. after 1499, the date of his latest picture. He painted religious pictures in tempera with a brilliancy and power equaling the effects of oils, and his 'Saint Augustine Enthroned' (in the gallery of the Academy of Venice), is a majestic figure distinguished by grandeur of conception and powerful execution. There is a 'Madonna and Child' of his in the London National Gallery, and his 'Death of the Virgin' was sold in London for \$1,100 in 1886.

Viver'idæ, the family of the civets (q.v.).

Vivian, vīv'i-an, Herbert, English author: b. England, 3 April 1865. He was graduated from Trinity College, Cambridge, in 1886, has traveled extensively, was editor of the 'Whirlwind' in 1889, special correspondent of the London *Morning Post* in 1898-9, of the *Daily Express* in 1899-1900, and in 1901 revived the 'Rambler.' He has published 'Servia, the Poor Man's Paradise'; 'Tunisia and Modern Barbary Pirates'; 'Abyssinia,' etc.

Vivian, Thomas Jondric, American author: b. Cornwall, England, 3 Aug. 1855. He was educated in France, came to the United States, where he engaged for a time in teaching, and since 1886 has been engaged in editorial work. His writings include: 'Seven Smiles and a Few Fibs'; 'Everything about Our New Possessions'; 'Luther Strong'; translation from Catulli Mendes' 'The Fairy Spinning-wheel,' etc.

Vivian Grey, a novel by Benjamin Disraeli, published in 1827-8. It was his earliest essay in fiction, and despite serious faults of construction and character delineation achieved great success, its unusual representation of the hero as a man-of-the-world no doubt having much to do with its popularity.

Viv'ianite, a mineral having the composition of a hydrous phosphate of ferrous iron, $\text{Fe}_2(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$. It often occurs in globular masses showing stellate-foliated structure, also earthy or as an incrustation. Distinct crystals are comparatively rare. They are monoclinic prisms, usually transparent and of metallic-pearly to vitreous lustre. They exhibit strong pleochroism, and green, steel-blue to indigo-blue colors. The cleavage parallel to the clinopinacoid is highly developed. The hardness of vivianite is 1.5 to 2 and its specific gravity is about 2.63. It is often associated with pyrite, pyrrhotite or limonite and is also found in the clay beds, peat bogs and the green-sand formations. Many curious occurrences are noted in mineralogical books. The original locality in Cornwall, England, has produced many fine specimens, also Australia, Allentown and Mullica Hill, New Jer-

sey. It was named in honor of its discoverer, the English mineralogist, J. G. Vivian.

Vivien de Saint-Martin, vê-vê-ăn dè sãn mâr-tãn, **Louis**, French geographer and author: b. Saint-Martin-de-Fontenoy, France, 17 May 1802; d. Paris 3 Jan. 1897. He early devoted himself to geography, his first work 'Carte Electorale' appearing in 1823. He founded and conducted in 1828-30 'Bibliomappe,' a geographical journal, and subsequently was engaged for many years in various labors of translation and editing. He was one of the founders of the Paris Geographical Society, and in 1863-76 he edited the 'Année géographique,' a post which he resigned to assume direction of the 'Nouveau Dictionnaire de géographie universelle.' His works include: 'Description de l'Asie Mineure' (2 vols. 1845); 'Etude sur la géographie grecque et latine de l'Inde' (1848-60); 'Atlas universel de géographie, moderne, ancienne, et du moyen âge' (1877), etc.

Viviparous Animals, the name given to those animals which bring forth their young alive. Properly speaking, the name should be limited to that form of reproduction seen in Mammalia alone, in which the young during the whole course of their development are contained within the parent body, and bear to the parent organism a definite and intimate degree of relationship. Thus in Mammalia the young animal is contained within a special cavity, the uterus or womb, and is nourished by the blood of the parent during its development, while only at birth does it pass from the body of the parent to the outer world. This is a very different process from that observed in some fishes, and in several reptiles, in which the eggs, from which the young are produced, are retained within the parent's body until the young are hatched therefrom. Such forms are named *ovo-viviparous*, but there is no intimate or organic connection between the parent and offspring in such a case. See REPRODUCTION.

Vivisection—Its Influence on Surgery. I have been asked by the editor of 'The Encyclopedia Americana' to write a brief résumé of the influence of vivisection on the progress of modern surgery. I shall do so as briefly as I possibly can, stating only facts which are generally well known to surgeons, but of which the general public of necessity must be ignorant to a great extent. Most of the facts below stated are known to me personally, as they have occurred during my professional lifetime; and I can, therefore, vouch for their accuracy.

If a physiologist were asked to contribute a similar paper he would be able to tell a similar story as to the revelations of the functions of various organs in the human economy obtained through vivisection; if a professor of pharmacology (that is, the action of drugs upon the living body) were to write a similar paper he would be able to show an equal debt owing to animal experimentation, first in giving us an exact knowledge of the action of drugs, and, secondly, in the introduction of a large number of new drugs. In this way cocaine was introduced into medicine and the proper use of such a powerful drug as digitalis was shown.

If a medical man were to write a similar chapter he would scarcely know where to begin. The whole life history, for example, of the

Trichina has been studied in animals and the results applied to man, so that if every one would heed the warning no one need die from the trichina worm in pork. This has had also an enormous commercial value, since all our hog products are exported on condition that the trichina be excluded by microscopical examination. In diphtheria the percentage of deaths has been reduced in Baltimore from about 70 per cent to about 5 per cent. The saving of human life in a single year in New York has been 1,500. All this is due to the antitoxin of diphtheria, which has been evolved almost solely as a result of animal experimentation.

Two water companies in London in 1853 experimented on 500,000 human beings, and, as a result of the cholera, one of them killed 3,476 human beings. In that same year Thiersch, in Leipsic, experimented on 56 mice. Had the lesson of these few mice been heeded the lives of these human beings might have been saved. More than that, even at the present day, as a result of Koch's discovery of the cause of cholera, Haffkine, in India, is making protective inoculations which are proving of the greatest value. By the same method we have recently discovered that the bubonic plague is spread by rats, and that efficacious vaccines can be used against this dreadful disease; that the malarial parasite and yellow fever are spread by mosquitoes, as proved by studies in birds and in human beings; and the preventive inoculations against typhoid (as yet in the early stage of their use) have been discovered by the same means.

Let me give one illustration of the method by which the cause of one disease—tuberculosis—was proved. Similar methods are employed in tracing the causes of others. In a case of consumption of the lungs the expectoration is examined by the microscope after applying a staining material. Without staining the tubercle bacilli are so translucent (like little rods of jelly) that we can scarcely see them. Having found this peculiar germ in the expectoration, some of the material is injected under the skin of a guinea pig or mouse. After a certain time the animal either dies or is killed, and a post-mortem examination is made. If there are found in the body of the guinea pig little nodules—that is, tubercles (little tubers)—these are examined by the same method and the same germs will be discovered and can be obtained in a pure culture. But the circle of proof is not yet complete. A small portion of this pure culture of the germs obtained from the inoculated animal is again injected into another animal, and if the second animal suffer from a similar disease and the same germ be found again, the conclusion is irresistible that the cause of the tuberculosis is the peculiar germ always found in such cases.

I well remember the incredulity with which I first read of the origin of lockjaw from the soil, but very soon this incredulity was changed to belief in the face of absolute demonstration after this fashion: It had been well known for years that hostlers, cavalymen, farmers, and persons who were engaged in any occupation about horses were peculiarly liable to lockjaw. After the discovery of the bacillus of lockjaw in 1884, by Nicolaier, when a case of lockjaw occurred, the ground on which the patient had fallen, or the instrument by which he had been

VIVISECTION

hurt, was examined, and a certain bacillus was found in or on it. This was inoculated into animals, and was found to produce the same disorder; and the same bacillus was recovered from the animal's body, was re-inoculated, and reproduced the disease. The circle of proof, therefore, was complete. This explained the popular belief that treading on a rusty nail is a frequent cause of lockjaw; not because it was a nail or old or rusty, but because the germ of lockjaw was on it and in the ground in which it was lying. No such exact experiments are justifiable on man. The sacrifice of a few rats quickly gave us all the desired information. This has abolished lockjaw as a result of surgical operations, and enabled us to cure it in many cases even after accidental inoculation. Before 1884 it was both frequent and fatal; now it is almost a surgical curiosity, except after neglected accidents.

The two most important surgical discoveries of the 19th century were: (1) anesthesia, especially by ether (in 1846) and by chloroform (in 1847); and (2) antiseptics, by Lord Lister, who began his work soon after the middle of the 19th century and had distinctly formulated it about the end of the '60s. His remarkable paper in 'The Lancet' of 3 April 1869 (when he was simply Mr. Lister, professor of surgery in the University of Glasgow), was one of those papers which marked a new era in surgery. Several years before he had announced that he believed that inflammation and most of our surgical disorders were due to germs, and that if we could exclude these germs we would be able to secure the healing of wounds without inflammation and without the formation of pus (matter); yet it was not until 1881 that Ogston and Rosenbach discovered the germs which produce the terrible results of inflammation, such as erysipelas, hospital gangrene (what irony in the name!), abscesses, blood poisoning and even death.

Hemorrhage.—One of the most important contributions by Lister to the progress of surgery was the introduction of antiseptic threads (ligatures) of catgut, with which to tie blood-vessels. An early Philadelphia surgeon, Philip Syng Physick, tried to get rid of the dangers following silk, which had been used to tie arteries ever since Ambroise Paré introduced it in the 16th century as a happy substitute for the horrible hot pitch and hot iron which then were the only means for arresting hemorrhage. Physick sought to use buck-skin, on the ground that it was an animal substance and would, therefore, disappear by absorption. Dorsey used catgut. Hartshorne used parchment cut in fine threads, and Bellinger and Eve the tendon of the deer. But none of these surgeons succeeded in giving us harmless ligatures until Lister taught us how to use them. In the paper to which I have referred he showed that the old idea of a ligature was that it was a foreign body which was ultimately to be got rid of by its rotting through the walls of the blood-vessel. The result was that in a very large percentage of cases the blood-vessel was not stopped by a clot; secondary hemorrhage took place (usually during the second week after an operation), and many a patient bled to death.

I shall never forget one night in the Satterlee Hospital in West Philadelphia, about 10 days

after the battle of Gettysburg, when I was called five times to check just such secondary hemorrhage from the rotting through of silk ligatures. As a consequence of the introduction of antiseptic ligatures by Lister I do not recall in the last 20 years five cases similar to these five that I then attended in one night. In other words, secondary hemorrhage has almost disappeared from surgical experience.

How did Lister find out the proper method of tying an artery? On 12 Dec. 1867, he tied the great carotid artery in the neck of a horse with a piece of pure *silk* saturated with a strong watery solution of carbolic acid, cutting both ends of the thread short and dressing the wound antiseptically. Healing took place without any inflammation. Six weeks after the operation he investigated the parts by dissection, and found that if the thread had not been applied with the antiseptic precautions secondary hemorrhage would unquestionably have occurred, and in all probability the animal would have bled to death. On 29 Jan. 1868 he applied this principle in the case of a woman of 51 with an enormously dilated sac (an aneurysm) in the upper part of the great artery supplying the thigh and leg. She, like the horse, recovered without inflammation, and lived for 10 months. On 30 November she suddenly died as the result of a rupture of a similar dilatation of the aorta in the chest. This gave Lister the unusual opportunity of examining in a human body the result of his application of an antiseptic thread to the arteries. The case emphasizes one of the great difficulties in studying such questions on human beings. The opportunity for a post-mortem examination after such an application of a new principle can only be occasional. If this woman at the time of her death had been under the care of some other surgeon than Lister no such careful examination of the consequences of the tying of the artery would have been made, and no further progress would have followed. The result of his examination showed that in spite of his care an incipient abscess was developing at the point at which he had tied the artery. This was in consequence of the presence of the thread, and especially of the knot.

As a result of this investigation, on 31 Dec. 1868 he tied the carotid artery in the neck of a calf with *catgut* which had been prepared with carbolic acid, and all antiseptic precautions were used during the operation. The calf recovered perfectly, and in 30 days was killed and the parts dissected. He found that at the site of the thread of catgut, replacing the thread, there was a band of living tissue which closed the artery, and that, therefore, instead of the thread rotting through, as was the case with the silk, it had become a part and parcel of the tissues. The artery, instead of being so weakened as to allow of secondary hemorrhage, was really stronger at this point than at other points. The ligature and the knot had entirely disappeared.

I have narrated this somewhat in detail for this reason: It illustrates admirably the method of scientific progress by experiment upon animals. Neither of these animals suffered any material pain, both operations having been done with the same antiseptic care as in a human being. Both of them were killed at such a time as would facilitate our knowledge of the results.

VIVISECTION

Since then other experimenters have tied the blood-vessels in animals and have killed them at varying intervals and made microscopical examinations of the blood-vessels. In this manner our knowledge of the way in which hemorrhage is stopped is now complete. The knowledge which was attained within a short time by the sacrifice of a few animals would have been attained only after many years by occasional post-mortems, and would then have been very much less perfectly attained and by the loss of many human lives instead of a few animals' lives.

Contrast, now, the result of the old and the new surgery in the mere matter of stopping hemorrhage after operations or accident by tying blood-vessels with the old ordinary silk and the modern antiseptic catgut, or with silk itself as now used by improved methods. In the old way the blood-vessels were tied with silk, which was as clean as an ordinary housewife would have it. One end was left long, and it was no uncommon thing after an amputation of the thigh to have as many as 20 or 30 of these ligatures or threads hanging out of the wound. After two or three days, when those on the smaller blood-vessels would possibly be rotted through, each ligature was pulled upon, and those that were already loosened by putrefaction came away. Finally, at the end of 10 days, two weeks, or three weeks, the ligature on the great blood-vessel of the arm or the thigh came away, not uncommonly followed, as has been stated, by profuse and often fatal hemorrhage. Sometimes, as in Lord Nelson's case, such a ligature did not rot away for years, and required dressing of the arm all of this time on account of the constant discharge.

What happens to-day in a surgical operation where either properly prepared silk or catgut is used? We tie all the blood-vessels needing it, cut off both ends of the threads short and close the wound entirely; and, instead of having discharge and horrible inflammation for days and often weeks and sometimes months, it is now a rare thing for such a wound not to be entirely healed within 10 days, and sometimes less, and secondary hemorrhage is almost unheard of. If vivisection had given to surgery only the modern means of stopping hemorrhage it would be worth all the labor it has required and all the suffering it has inflicted on all the animals ever experimented upon.

Of late a new problem in hemorrhage has been presented. When an artery is wounded—as, for instance, if the blade of a pocket knife has been thrust into the thigh and wounds the great femoral artery—the only way to prevent the patient's bleeding to death has been to expose the artery and tie it above and below the point where it was cut. Of late several surgeons (especially Murphy, of Chicago) have made some very ingenious experiments on such wounded blood-vessels. They have carefully exposed the artery of an animal (under an anesthetic, of course), have wounded it, and then, instead of tying the artery, have sewed up the wound in the wall of the artery to see whether this could not be done successfully. The reason for this series of experiments is this: When we cut off the supply of blood to a leg or an arm by tying the blood-vessel, gangrene not uncommonly occurs, because the chief blood supply of the limb is cut off by

tying the artery. If instead of tying the vessel we can sew up the wall and it will heal, the current of blood is uninterrupted and there is no danger of gangrene. Matas of New Orleans has cured even aneurysms by sewing up the walls of the arteries in a similar manner—a great recent advance in the treatment of this often fatal disease. One thing is perfectly manifest—it would never be proper to make such experiments on human beings. Human life would be endangered, and no surgeon would adopt or would be justified in adopting such a novel procedure until it had been tried and proved successful on animals. Several successful cases of suture (sewing) of the large blood-vessels have now been done in man.

The Brain.—When I first taught anatomy, 38 years ago, the various portions of the brain were not supposed to have separate functions. We knew, of course, that disease or an injury on one side of the head produced paralysis on the opposite side of the body. Broca also discovered by observations on man in actual cases of disease that when that part of the brain corresponding to the left temple was affected the power of speech was lost. But if a man had a fracture of the skull or a gunshot wound in the region above the ear or in the front of the brain or the back of the brain, there was no well recognized difference in the results. This was largely due to the fact that such injuries are widespread, and not limited to small areas. In Germany Fritsch, Hitzig, and Goltz, and in England Horsley, Ferrier, Schaeffer, and others, pursued the following plan: The monkey's brain is the nearest in similarity to man's. A known portion of the brain—for instance, the region above the ear—being exposed, the brain was mapped out in small squares and each one of these squares in succession had the pole of a battery applied to it. The phenomena which occurred—whether opening and shutting the eyes, turning the head right or left, contraction of the muscles of the arm or leg—were all carefully noted down. In this way a distinct map of the brain was made, so that now we know definitely that a certain area of the surface of the brain governs the movements of the eyes, of the head, of the arm, forearm, hand, thumb, thigh, leg, great toe, etc. In the same way at the back of the head the area which governs sight has been found, and it was discovered that the area on the right side if destroyed made the right half of each eye blind, and that if the area of the left side was destroyed the left half of each eye became blind. This description is, probably, sufficient to indicate how physiologists and surgeons have investigated the brain.

The following is an instance which shows how accurately this method has enabled us to locate the motor centres in the brain: A girl who suffered from epilepsy and in whom the convulsions always began in the right thumb, and then spread to the arm and the body, was operated upon. A piece of the gray matter of the brain, as large as the last joint of the forefinger, was removed from the place determined upon animals as the centre governing the movements of this thumb. When she awoke from the ether every muscle moving the thumb was entirely paralyzed, and no other muscle in the body. When we remember that the muscles which move the thumb arise in the

VIVISECTION

ball of the thumb, between the thumb and the forefinger and on the front and the back of the forearm nearly as high as the elbow, this is seen to be most remarkable. I do not know a single case ever recorded of so minutely located disease. By no other means than vivisection could this small thumb centre have been determined. She entirely recovered from the paralysis, and her epileptic fits instead of being almost daily were reduced to one or at the most two a year. This has made possible the modern surgery of the brain, which would not exist to-day were it not for vivisection.

Here and there an unexpected post-mortem examination, as in the case of Lister's woman patient, has given us some special information, but nine tenths if not ninety-nine one-hundredths of our knowledge of cerebral localization is the result of exact experiment on animals. As a consequence of this in 1884, for the first time in the history of surgery, the existence of a tumor of the brain, which was not indicated by anything on the outside of the head, was diagnosed, its location determined, and the tumor removed. When the skull was opened no tumor was visible; but so confident was Mr. Godlee, the surgeon, that he cut boldly into the substance of the brain and there found the tumor which had been so accurately diagnosed. Since then this first achievement has been repeated not only scores, but hundreds of times, and the net result up to 1899 was that 491 brain tumors had been operated on. In 64 palliative operations for the relief of headache, blindness, etc., the mortality was only 15.6 per cent. In 275 completed operation, 82 died, a mortality of 30 per cent. In 43 cases in which the tumor could not be removed, 29 died, a mortality of 67.5 per cent. In 109 cases in which the tumor was not found, 57 died, a mortality of 52 per cent. This localization of cerebral functions, together with antisepsis, has so revolutionized (or, rather, created) modern cerebral surgery that the principal facts are a matter of common knowledge. Tumors are now attacked not only in what is called the motor area (that is, that portion of the brain governing movement, which, roughly speaking, may be described as lying above the ear), but many times in the front part of the brain, and at the back of the brain, far outside of the motor area. In case the tumor is at the base of the brain, or at certain other parts this knowledge has prevented useless operations which otherwise might have been performed.

It is a source of sincere gratification on the part of numerous surgeons that by this same knowledge of cerebral localization derived from animal experimentation they have been able to recognize hemorrhage inside the skull, open the skull at the right point, even when there was no fracture, and save their patients. Before experiments on animals showed us how to interpret the symptoms this was an impossibility, and nearly all such patients died. Now we save, roughly speaking, two out of three.

Time and space would fail me to tell of the abscesses of the brain, of the foreign bodies in the brain (such as nails driven into it by accident or design, rifle balls which had lodged in it) and of many other similar surgical disorders the modern successful treatment of which depends directly upon the localization of cerebral

functions, which is the result almost wholly of experiments upon animals.

The Spinal Cord.—Up to the present time the belief of surgeons has been that in case the spinal cord was completely cut in two, either by gunshot wounds, fracture of the spine or otherwise, no reunion of the two ends would take place, and, therefore, there was no possibility of relief for the paralysis below the point of division of the cord which is almost always fatal. Very recently, at the Pennsylvania Hospital, Dr. Francis T. Stewart had a patient whose spinal cord was cut in two by a bullet. He removed the bone sufficiently to get access to the spinal cord, and found it completely divided. He immediately stitched the two ends together, and, strange to say, this patient has recovered both feeling and motion to some extent in both legs. Since his case two or three other similar cases of recovery of sensation and motion have been reported. I think it would be evident to any person that such a totally unexpected result deserves the most careful investigation. In man cases of such complete division followed by recovery are almost unknown; and if they had to be studied in man this would be imperfectly done, and probably would require 15 or 20 years before we would know what ought to be done. It is one of those cases in which it is our duty to investigate by experiments upon animals what is the best method of sewing the two ends of the spinal cord together; at what date after division of the cord it will be hopeless to do so; how much of the cord can be lost (that is to say, a half inch, inch, or more) and yet by stitching the two ends together it will be possible to restore the function of the spinal cord. One can see very readily that in animals all these problems can be studied minutely, in a sufficient number of cases; various procedures can be tested and the results determined accurately by killing such animals at a suitable date, and a definite conclusion can be reached in a short time.

In 1888 Mr. Horsley, the distinguished London surgeon, and Dr. Gowers, equally distinguished as a neurologist, for the first time in the history of surgery made a diagnosis of a tumor of the spinal cord, definitely located it and the former removed it, the patient making an absolute recovery. A number of other cases have been successfully operated on since then. Just as in the case of tumors of the brain, this would not have been possible had it not been for experiments upon animals, which have given us practically most of our present knowledge of the minute anatomy and physiology of the spinal cord and have, therefore, enabled us to deal with it surgically.

Nerves.—Among the most fruitful branches of research which have been so valuable in results are the animal experiments upon the different nerves of the body. The methods by which nerves could be sewed together; the possibility of taking a portion of a nerve or even of the spinal cord from a rabbit or other animal to replace a piece of the nerve when it has been destroyed by accident or disease; the possibility of sewing one nerve to a neighboring nerve in order to re-establish its function—all of these and other similar operations have been studied in animals, and could only be studied in animals with exactness.

VIVISECTION

In order to study such conditions it is not enough that the two ends of the nerve should be sewed together and then, after the wound was healed, that we should simply determine the fact that the functions of the nerve are re-established. It is necessary to know by the microscope the various steps of the process of union of the nerves—to investigate various methods of sewing them together; whether they can be overlapped, or must be applied exactly end to end; whether one end of the nerve can be split and the other inserted into it, or turned over as a flap, and so on. Evidently numerous methods can only be studied on animals. Then, when the results are known, we can apply them for the benefit of man.

The Thyroid Gland.—One of the commonest diseases in Europe, and one that is occasionally seen here, is goitre. This forms a large tumor in the neck, for which formerly little could be done, as operation was nearly always fatal. Such patients were obliged to go through life with a dreadful deformity, in the greatest discomfort, and were sometimes suffocated by pressure on the windpipe. In consequence of the introduction of the antiseptic method of Lister, which we owe to vivisection more than to any other agency, operations on the thyroid gland are now so common that at the German Surgical Congress Professor Kocher, of Bern, has reported 2,000 operations done by himself, with a mortality of only 4 per cent.

Very soon it was discovered that removal of the entire gland produced a curious effect. The face became bloated; the expression greatly changed, and the patient became more or less idiotic—that is, the condition known as myxedema followed. This led to improvement in operations in several directions. First, in all those cases in which the tumor could be shelled out, as an English walnut is turned out of its shell, leaving a portion of gland tissue behind, this was done. The similar effects of the removal of the thyroid in animals were studied especially by Mr. Horsley. Surgeons then removed the thyroid gland from the neck of an animal and placed it under the skin of the same animal, and it was found that the disastrous results were avoided. After a number of experiments on animals there was good reason to believe that the disastrous effects of the operation, which sometimes followed goitre could be avoided in man by the same procedure. Accordingly after removal of a goitre (that is, the enlarged thyroid gland in man) the thyroid gland of a sheep was transplanted in a number of instances under the skin, or in some cases into the abdominal cavity of the patient. In both cases there was improvement for a time; but eventually the majority of the cases suffered from cretinism or from myxedema, which may be described as a less severe form of the same disease. Finally in animals a study was made to determine how much of the gland must be left in order to prevent myxedema, and now we are able to relieve patients from goitre and yet, by leaving enough of the gland, prevent any bad results following the operation.

These results led also to a careful study of the effects of giving an extract of the thyroid gland to human beings. Some of the most brilliant results that have ever been obtained in medicine have followed the administration

of the thyroid extract to cretins in whom the disease had not been produced by operations for goitre, but arose naturally. In certain forms of goitre it has enabled us to relieve or even to cure without operation. In insanity and many other mental states it is used as a well established remedy, which in even a large percentage of cases is followed by great benefit and often by cure. In many other diseases also the thyroid extract has been used with the best results.

The Larynx.—Cancer of the larynx, or that part of the windpipe back of and just below the Adam's apple, is not at all uncommon. The only hope of such patients is in removing the entire larynx or voice box. Before attempting this for the first time on man Billroth, of Vienna, and his assistant, Czerny, now the distinguished professor of surgery at Heidelberg, tested the operation on several dogs. Billroth then removed the larynx from his patient and saved his life. This operation has now been successfully repeated scores and scores of times as a result of these few experiments on dogs.

The Lungs.—A beginning has been made in the surgery of the lungs, but as yet we have not reached the point where we can say that we have attained entire success. In a number of animals parts of the lungs have been cut out with a view of discovering the possibility of cutting out diseased portions of lung, the seat of tumors, consumption, and other disorders, and a few operations have been done upon man, with a fair percentage of success. Not uncommonly abscesses of the lungs which were perfectly inaccessible a few years ago have been reached and opened. Sometimes coins and other foreign bodies get into the bronchial tubes, and can only be reached through most difficult and dangerous operations. Several surgeons have experimented upon animals to determine the safest method of removing such bodies, but with only partial success. Is it not evidently our duty to devise new operative procedures and test them on animals first, and when a reasonably promising one has been found, to apply it to man?

The Liver.—In 1890 Ponfick, of Germany, showed that in rabbits the removal of a quarter of the liver caused a slight deterioration in the condition of the animal; removal of one half was followed by much more serious symptoms, which, however, passed off within a few days. Even removal of three fourths of the whole liver could be recovered from, but removal of more than this was always fatal. By killing the animal in which a small part had been removed at a suitable time, and studying microscopically the liver tissue at different periods of time after operation—a procedure manifestly only possible in animals—he showed that there was a reparative power in the liver, which before then was unknown.

Up to that date less than a dozen surgeons had operated on tumors of the liver. In only two of them was any considerable portion of the liver removed. After the paper by Ponfick, which showed how much could be removed, surgeons immediately operated with much more confidence, and removed considerable portions of the liver. Up to 1899, 76 tumors of the liver had been removed. Of these cases the termination of two was unknown; of the remaining 74,

VIVISECTION

63 recovered and 11 died—a mortality of less than 15 per cent. One who is not a surgeon can scarcely appreciate how differently the operation for tumor of the liver was regarded before and after Ponfick's experiments. Before that everything was marked by timidity; after that everything was marked by confidence, and all to the benefit of the patient.

The Spleen.—The same story that has been told of the liver can be told of the spleen, though with much less good results. As a result of studies, partly by accident, in man (as when in consequence of a stab-wound or other injury a spleen would protrude through the wall of the abdomen, and would have to be removed), but chiefly as a result of the careful studies of removal of the spleen in animals, beginning practically with Schindler's experiments in 1870, we are now in a position definitely to say that in man the whole of the spleen can be removed, and he can not only survive the operation, but get along comfortably without any spleen. A very considerable number of such operations have now been successfully performed.

The Kidney.—On 2 Aug. 1869 Professor Simon, of Heidelberg, laid the foundation of the modern surgery of the kidney by removing a healthy kidney from a healthy woman. The reason for it was that in removing an ovarian tumor some time before he had been obliged to remove a part of the ureter (the tube leading from the kidney to the bladder), and to fasten the cut end to the skin. As a consequence of this the woman was in a most deplorable condition from the continual escape of urine over her person. After a number of unsuccessful attempts to close this external opening, it finally occurred to him that the only way to cure her was to remove the kidney on that side. Whether a human being would recover and could live with only one kidney was practically unknown. It is true that disease had destroyed one kidney in some patients and the other had gradually developed ability to do the work of both. Injury also had destroyed parts or all of one kidney; but deliberately to take out a healthy kidney from a healthy human being was an operation not only fraught with danger, but one before which all the surgical world up to that time had recoiled. No one had studied the effect on the remaining kidney and upon the heart. No one had carefully determined what was the best method of reaching the kidney—whether through the abdomen or through the loin from the back; what to do with adhesions and many other technical questions. All these had to be settled. Accordingly he experimented on a number of dogs; decided that from these indications a human being could live with only one kidney; studied on the cadaver the best way of doing the operation, and on 2 Aug. 1869, removed this healthy kidney through the loin and saved the patient's life and made her perfectly comfortable. She died in 1877, after eight years of healthy life.

As I have said these new experiments laid the foundation of the modern surgery of the kidney have been opened; scores of stones have been removed successfully. Finding this operation so feasible, surgeons were led to practise other operations; some hundreds of abscesses in the kidney have been opened; scores of stones have

been removed from the kidneys; floating (that is, loose) kidney has been sewed fast in hundreds of cases; many cases of tuberculosis of the kidney have been relieved or cured; tumors of the kidney are successfully attacked; even the cut ureter has been spliced and stones removed from it. In a word, Simon's experiments on a few dogs opened to us a new domain in surgery which until then was wholly unknown. Would it not be gross cruelty to man to prevent such beneficent researches?

The Stomach.—Until 1875 practically there was no surgery of the stomach. As occasional Cæsarean sections have been done in the past, so occasional operations on the stomach were done when the surgeon was obliged to do them. Now, however, it is a matter of routine procedure, to the vast benefit of the human race. Had vivisection contributed nothing else to the progress of surgery than its services in the surgery of the stomach, this alone would be sufficient to justify it. I may quote from the Cartwright lectures* which I gave before the College of Physicians and Surgeons in New York in 1898:

"In 1875 Tschertneisky-Barischewsky cut out a piece of the intestines in 35 dogs, with 29 recoveries—a startling result when compared with the former fatality of such operations. This was the starting point in the new gastrointestinal surgery. The next year Gussenbauer and Winiwarter cut out a piece of the stomach in only seven dogs. We scarcely can appreciate at this day, though these experiments are so recent, how many new questions had to be answered. After their first unsuccessful experiment they naively remark that certain facts were established by the experiment, among them, 'that the surfaces of the stomach have a real tendency toward union by first intention, . . . just as do wounds of the skin.' (!) Whether this would be correct of man as well as of animals they admitted was as yet uncertain. Another point settled by the experiment was 'that there was no digestion of the mucous membrane in the neighborhood of the wound.' Their second experiment was followed by recovery, and showed not only that such an operation could be successfully done, but that the narrowing caused by the scar did not interfere with the functions of the stomach, either as to its movement or its secretion of the digestive juices, and that the removal of the pylorus was not followed either by the too early escape of the food into the intestines; or by the reflux of the intestinal contents into the stomach. The dog was killed five months later and the post-mortem showed no contraction by reason of the scar, and no digestion of the edges, and his perfect health after the operation showed that the movements of the stomach and its digestive functions had not been interfered with. Then, again, the question whether catgut or other suture material was the best, and what kind of a knot and what kind of a suture would best answer were subjects of debate. . . .

"Our anti-vivisection friends, who so often declare that experiments upon animals have never contributed anything to the progress of surgical science, may well be challenged to account for the remarkable progress in the surgery of the stomach which immediately followed these

* In quoting this I have popularized some of the medical terms there used.

VIVISECTION

fruitful experiments. The dogs that died did not die in vain. They showed the correct methods and indicated errors in technic, and directly led up to the modern surgery of the stomach and the intestine in man, as follows: In the very same year, 1876, Hueter cut out a part of the bowel, though without success. In 1877 Czerny for the first time sewed up the intestine and dropped it into the abdominal cavity, with recovery; followed almost immediately by Billroth, who did the first successful suture of the stomach and total removal of a portion of the bowel. In 1878 Forelli operated for a wound of the stomach, and in 1879 Cavazzani removed a portion of the stomach for tumor. In the same year Péan did the first removal of the pylorus. In 1880 Rydygier did the second, and in 1881 Billroth did the third and first successful one, without a knowledge of the preceding operations."

Then followed various operations on the stomach to which I will allude later, and finally the successful removal of the entire stomach. It is quite impossible to give the details of all the various operations now done on the stomach and indicate minutely the part that vivisection has had in developing this extraordinarily successful branch of modern surgery. Suffice it to say that among them are the following, all of which owe more to vivisection experiments than to any other single agency:

In cancer of the œsophagus, or in the constriction of the œsophagus which so often follows the accidental or intentional swallowing of lye or acids, etc., so that no food can get into the stomach, we now open the abdomen, open the stomach, introduce a tube or construct a passageway into the stomach, and feed the patient through this outside œsophagus, as it were. In case the narrowing of the œsophagus is not from cancer the patient can live his natural span of life. In case of cancer his remaining days are rendered relatively comfortable, since the operation prevents his starving to death. When we have cancer at the opposite end of the stomach (the pylorus), so that the food, though it can be swallowed, cannot get out of the stomach, one of two courses is followed, both of which have been carefully studied in the lower animals and then adapted to man. First, the portion of the stomach and bowel involved in the cancer is cut out and the bowel united to the stomach directly, or, in other cases, an opening is made in the stomach and one in the bowel lower down, and the two openings are sewed together, thus allowing the food to pass from the stomach directly into the bowel beyond the cancer. The mere question of how the stomach and bowel shall be most successfully united in these cases, particularly the best method to prevent fatal leakage, has required very many series of experiments, especially in this country, by Senn, Abbe, Brockaw, Ashton, Murphy, and others. As a result of their labors sometimes we have learned how *not* to do the operation because of unexpected difficulties; sometimes how to better our procedure, until now we are in possession of satisfactory methods, as has been proved by the successful operation on man many times over. Even the sewing together of the stomach and bowel alone had been done up to 1898 in 550 cases which

have been published. I have no doubt that since then this number has almost been doubled. The mortality of this operation from 1881 to 1885 was 65.71 per cent; from 1886-1890, the mortality had fallen to 46.47 per cent; from 1891 it had again fallen to 33.91 per cent, and recently in 27 cases an Italian surgeon (Carle) has had a mortality of only 7.4 per cent.

Moreover, the experiments on animals having shown how safe various operations are, have emboldened us to enlarge the sphere of our operations and do others that were before not dreamed of—a good instance of the partly indirect good results from vivisection. A brief enumeration of some of the various operations done upon the stomach, together with their mortality, is as follows:

1. Where the stomach is bound down by adhesions (which often produce the most serious digestive disturbances, destroying comfort and even threatening life), we now open the abdomen, cut or tear the adhesions, and practically all of the patients recover.

2. Where there are foreign bodies in the stomach (or in some cases foreign bodies that have stuck in the œsophagus low down near the stomach), we open the stomach, remove the foreign body (often inserting the arm to reach it in the œsophagus), sew up the stomach and the abdominal wall, and the patients generally recover. In some cases as many as 192 staples, buttons, screws, horseshoe nails, etc., weighing over a pound and a half, have been removed, and the patients have recovered.

3. Where the œsophagus has been narrowed by the swallowing of lye, etc., instead of making a permanent opening in the stomach (as before described), sometimes by having the patient swallow a perforated shot which will carry a string down into the stomach, we can open the stomach temporarily, seize and draw out the shot, attach a conical dilator to the string, and, after having dilated the constriction of the œsophagus, remove the string, sew up the stomach and the abdominal wall and cure the patient permanently.

4. We now open the stomach purely to explore it and find out whether or not there is serious disease. This has enabled us in many cases to relieve illness which otherwise was incurable. Nearly all of these patients recover from the operation.

5. The permanent opening in the stomach through which we can feed a patient I have already described. It was first proposed in 1837. It was first done in 1849. From then until 1875 28 cases were operated on, with 28 deaths! It seemed almost as though the operation must be abandoned when, in 1875, the first operative recovery occurred. From then until 1884, in 163 cases there were 133 deaths—a mortality of 81.66 per cent. At the present time the mortality is only about 25 per cent in cases of cancer, and in the non-cancerous cases not over 10 per cent.

6. As I have indicated, in certain conditions we make an opening in the stomach and another in the bowel and sew the two together. In some cases of ulcer of the stomach, which cannot be cured by medical means, this gives wonderful results, both as to comfort and cure. The operation was first done in 1881, with a mortality

VIVISECTION

decreasing from 65.71 to 33.91 per cent in general, and in the statistics of single surgeons to only 7.4 per cent.

7. The first removal of the pylorus followed by uniting the bowel and the stomach was done in 1879. The mortality was very great, and still is large, ranging from 27.2 per cent in simple cases to 72.7 per cent when there are extensive adhesions.

8. When the pylorus is simply narrowed, but is not the seat of cancer, we make an incision in its long axis, seize the edges of the incision at the middle, draw them out at right angles to the line of the incision, and by sewing them in this position we widen the opening of the pylorus. This was first done in 1886. Up to 1894 the mortality was 20.7 per cent. Recently Carle has reported 14 cases, with a mortality of only 7 per cent.

9. In not a few disorders the stomach is dilated to nearly two or three times its normal size. In these cases we now take a "tuck" in it, as was first done in 1891. In 15 such operations only one death had occurred.

10. When the stomach, instead of being dilated, is displaced, we sew it fast, and practically in all cases recovery follows.

11. Sometimes the stomach is divided into two parts, like a dumb-bell with a very short handle. The first operation for relieving this condition was done in 1893 by making an opening in each half of the stomach and sewing the two openings together. Over 40 operations have been done for this condition, with only nine deaths.

12. Tumors of the stomach other than cancer are rare, but since 1887 at least seven cases of tumor have been cut out, of which six have recovered.

13. Partial removal of the stomach finally led to its complete removal, of which over a dozen instances have been reported, with a recovery of somewhat more than half. Nearly all, however, have died from recurrence.

Some of the above operations are not the direct result of experiment upon animals (as, for instance the taking of a tuck in the stomach), but they are the indirect result, first, through the antiseptic method, which itself is the child of vivisection, and, secondly, because through our experience in other operations we have been led to perform totally new ones. It is the same in other sciences. If we were still dependent upon the old "air-pump" worked by hand we should have no lighting by the incandescent bulb of to-day, for this is dependent upon a cheap method of making an almost complete vacuum. This is a wholly unexpected and indirect result of improvement in air-pumps as one of the chief factors of progress.

The Intestines.—Very much the same story can be told of the surgery of the bowel. Indeed, the surgery of the stomach involves largely that of the bowel. I need, therefore, only recall a very few points. When a tumor or cancer exists in the bowel, of course, in a little while it obstructs the passage of the intestinal contents; and if this obstruction becomes complete and is not quickly removed the patient must necessarily die. As a result of many experiments upon animals (more especially by Senn, Parkes, and other American surgeons) we now know how

to deal with this condition. First, if the tumor or cancer can be removed it is cut out entirely, and the two ends of the bowel are united. Our present successful means of uniting them are a result of most laborious researches by experimentation upon animals to discover the best method of doing this otherwise perilous operation. The slightest leakage of intestinal contents produces a fatal peritonitis. Where the cancer cannot be removed, in order to prolong the patient's life and lessen his terrible pains we make an opening above the obstruction and another one below and sew the two openings together. Here again many experiments were needed to determine whether an animal could live with the intestinal contents thus "side-tracked," and, if life could be maintained, what was the best method of doing the operation.

In gunshot wounds of the intestines, which formerly were among the most fatal of all accidents, we now can rescue a very large percentage of the patients. During the Civil War practically almost every case of perforation of the intestine by gunshot died. To see whether something could not be done to remedy this frightful mortality Gross many years ago performed some experiments to determine the best treatment of such wounds. Later Parkes etherized a number of dogs, shot them, opened the abdomen and treated the wounds in various ways; and in consequence of this and other series of experiments, at the present time many instances of recovery have been reported in which multiple wounds even to the number of 17 have been found, closed by methods determined by vivisection to be the best, and the patients have recovered. To reach this result it had to be determined by accurate observation on animals what was the best method of closing such wounds; what material is the best for use as a thread; under what conditions it would be needful, instead of closing the wound, to cut out the injured portion of the bowel and unite the two ends; how long after perforation occurred was the best time to operate, and many other such questions too technical to mention here.

In typhoid fever and in ulcer of the stomach also sometimes a perforation similar to the hole made by a bullet occurs, and the contents of the intestines or of the stomach are poured out into the abdominal cavity. Of course, every one knows that if this went on for a brief time death would necessarily follow. In the lower animals we cannot produce exactly the conditions following perforating ulcer of the stomach and perforations such as occur in typhoid fever; but, in consequence of the knowledge acquired by experimenting upon gunshot and incised wounds of the stomach and bowel in the lower animals, we finally woke up to the fact in 1884 that a perforation after such an ulcer, either in the stomach or in the bowel from typhoid fever, ought to be closed. In 156 cases of such perforation of the stomach operation has been done, and the recoveries have been 46.80 per cent. But in the last 54 of these operations done from 1896 to 1898 the percentage of recoveries has risen to 64.82 per cent. In 362 such operations done for perforation of the bowel in typhoid fever up to 1904 the recovery rate was 25.97 per cent. Some individual surgeons have saved one in three, and ultimately, I believe, one half of such patients will be saved. It must be remembered

VIVISECTION

that in such perforations of the stomach and bowel *every patient* would die were no operation done. To save one half or even one third is a surgical triumph.

I have several times alluded to cutting out a portion of the bowel and uniting the two ends. This involves a number of problems which ought not, and, in fact, cannot, be studied in man because of the fact that it is wholly inadmissible to test such operations (which always involve life) on man when they can be tested accurately and more quickly by experiments on animals and without involving human life.

I have stated that by many experiments on animals we have now reached a satisfactory solution of the problem how the two ends of the bowel are best sewed together. But one other question was still unanswered—how much of the bowel could be removed and yet life be preserved. A similar question, we have seen, has been answered in respect to how much of the liver could be removed by Ponfick's experiments. How much of the bowel could be removed was a most important question. We would all presume that a few inches, possibly even a foot or two, might be removed without danger; but when we remove a larger portion we cut down the digesting and absorbing surface to such an extent that it is a question whether the patient can still live. This has been determined upon animals, and then, as occasion required us to decide the question, in man. As a result of the knowledge derived from animal experimentation I saw a few years ago in Montreal a man from whom Shepherd had removed over one third of the entire length of the bowel (eight feet) which was involved in a large tumor; and yet the patient was in capital health for a long time after the operation.

Hydrophobia.—The search for the germ of this dreadful disease has as yet been fruitless; but happily the search for the means of prevention has been crowned with success. Of every 100 persons bitten about 15 contracted hydrophobia, and of those bitten on the head and face at least 80 per cent die of hydrophobia. Up to the time of Pasteur *every* person who contracted hydrophobia died, that is, the mortality was 100 per cent. The Pasteur treatment, which is entirely the result of animal experimentation, by preventing its occurrence, has reduced the mortality to less than 1 per cent of the persons bitten. And yet the establishment of Pasteur Institutes for the benefit of the human race has been resisted most strenuously by those opposed to vivisection.

Transplantation of Bone.—In 1867 Ollier a celebrated French surgeon who recently died, by experiments on animals showed that the membrane which covers the bones (the periosteum) could be peeled off a bone and transplanted to a distance into the tissues of the same animal, or even of another animal, and that it would there live and produce new bone. These experiments, very crudely described in these few words, have been extraordinarily fruitful in several directions.

First, in certain cases it is necessary to remove diseased or dead bone. These experiments showed us that if in removing the bone the periosteum was carefully guarded and left behind it would reproduce the bone. In some cases in which the lower jawbone has died as a result

of phosphorus poison in the employees of phosphorus match factories, the dead bone has been removed, but the periosteum has been preserved and a new jawbone has been reproduced. Another result has been that, instead of amputating, for example, an arm when the elbow is diseased, we can remove the bone and by preserving the periosteum can preserve a more or less useful joint.

In other cases a certain area of bone, as for instance, in the skull, is chiseled loose or otherwise separated from the surrounding bone excepting for an inch or two at the portion where the chief blood supply enters the flap. The bone is then forcibly broken at this unchiseled portion and turned back, the periosteum and scalp acting as a hinge. When the tumor has been removed, the abscess opened, or other needful operation done, the trap door is simply closed by replacing the flap, the scalp sewed in place and the integrity of the skull is restored. One can see that this is an immense advantage over having a great hole left in the side of one's skull.

In some cases, in which, in consequence of accident or abscess, a large hole already exists in the skull, we either chisel off bits of adjacent bone or replace the bone by a plate of celluloid and successfully fill this opening.

Again, in certain cases, for example, in which the jaw has been fractured, a bit of the bone has been chiseled loose from the patient's jaw and has been grafted in place as a bridge between the two fragments, so relieving the deformity or remedying an otherwise incurable fracture.

Again, a certain small number of children are born without any bone at the back of the spine in the neck or the loin (*spina bifida*). Through this opening the membranes of the spinal cord protrude and form a tumor which, if untreated, in most cases proves fatal. We now operate most successfully on most of these cases, and in suitable cases either chisel loose a bit of adjacent bone and transplant it, so as to close the opening, or in other cases take a bit of bone from one of the lower animals to fill the opening and cure the patient.

Again, in certain cases of fracture of the arm bone (humerus) the nerve going to the muscles on the back of the forearm, which winds close around the bone in a spiral, is torn in two; these muscles are paralyzed, and the patient has what we term "wrist drop," so that the hand is useless. In such cases the knowledge derived from two different series of experiments comes to our aid to enable us to remedy the trouble. First we find the two ends of the broken nerve, freshen these ends, unite them, and in many cases can change a useless hand into a useful one; but if so much of the nerve has been destroyed that the two ends cannot be brought together we now deliberately remove an inch or two of the arm bone, thus shortening the arm enough to bring the two ends of the nerve in contact and sew them together, and in a good percentage of cases we can again restore the hand to usefulness after months and occasionally even after years.

A still more remarkable transplantation of the bone is accomplished in some operations on the skull. In some cases it is necessary to remove a button of bone which may be an inch and a half or two inches in diameter in order

VIVISECTION

to do an operation on the brain. The operation which has necessitated this removal of bone may require an hour and a half or two hours. If we want to replace the bone so as not to leave an opening in the skull through which the brain may easily be dangerously injured we put the bone in a basin of hot salt solution or weak antiseptic solution, and by keeping it at a proper temperature, at the end of the operation, when it has been totally detached from the body for so long a time, we replace it and its vitality is not lost.

All of these various operations (and others which I have not time to describe) done on bone, to the immense advantage of our patients, are the direct or remote results of the experiments of Ollier and others on the transplantation of periosteum and of bone in animals. The indirect results are quite as valuable, and sometimes more valuable, than the direct results of such experiments.

An illustration of the indirect results of Ollier's experiments is shown in the transplantation of the skin. One of the oldest operations in surgery is the making of a new nose. When the nose has been lost a suitably shaped flap was cut on the forehead, leaving a sufficient uncut base for a proper blood supply so that the flap would not undergo gangrene. The flap was then turned by twisting it on its base and was sewed in place where the nose had been. The experiments of Ollier and his successors showed, however, that periosteum, and even so dense a structure as bone, could be entirely detached from the body for a long time and yet not lose its vitality. Hence we now transplant bone as well as skin to make firm instead of flabby noses. This has led us of late years to apply the same procedure to the skin, and enables us now to do far more extensive and more successful operations than would otherwise have been possible. The first method tried in man was that of Réverdin, of Geneva. He cut little bits of skin only as big as a pin's head from the arm or the thigh, not quite skin deep, and planted them on any raw surface which did not heal readily. These grafts under proper treatment adhere and form new centres from which healing of the wound takes place. Emboldened by this, Krause and other surgeons have taken very large pieces of skin, including often the whole thickness of the skin, and transplanted them. For example, in some cases of extensive cancer in which a very large portion of skin must be removed, now, while the patient is under the influence of the anesthetic, we take strips of skin an inch wide and several inches long from the thigh, or, in other cases, from another person who is willing to give up a portion of his skin. These pieces are immediately placed on the raw place left by the removal of the tumor, and as they do not lose their vitality but grow fast to the tissues under them, the wound is healed almost immediately, instead of taking a long time for the slow formation of a scar.

One of the most difficult of all wounds to heal is an extensive burn, such as is produced by the clothing catching fire. In these cases large surfaces of the skin on the chest or the abdomen slough off, resulting in great ulcers. These sometimes take months, sometimes years, to heal, and in not a few cases never heal, no matter what is done. Now, as a result of our ex-

perience, first with the periosteum and bone and then with small bits and then larger bits of skin, we transplant strips of skin as just described, and heal such wounds in a very short time. One sees in the newspapers every now and then accounts of some woman whose long hair has been caught in machinery and almost all of the scalp torn away. These wounds are healed by transplanting skin in a similar manner.

The Blood.—We are at present only just beginning to appreciate how much we can learn from examination of the blood, especially by new methods lately introduced. Almost every intelligent person knows that the blood consists, roughly speaking, of a fluid in which float small circular disks, about $\frac{1}{2500}$ part of an inch in diameter, called the red blood cells. In addition to these there is in the blood another kind of cell called the white blood cell. The red blood cells are made up chiefly of a substance called hemoglobin, which gives the color to the blood. Some of the investigations, which are really only at present at the beginning of their usefulness, are as follows. They are good illustrations of how inductive science begins by ascertaining facts. If they are valueless they are disregarded; if of value they are studied still further. It is not unlikely that the blood may soon be one of the most fruitful sources of the knowledge by which surgery may profit greatly:

First, the number of white blood cells. It is found that in case inflammation results in an abscess the number of white blood cells is increased several times. Ordinarily in a little cube of blood one millimetre (the twenty-fifth part of an inch) on each of its sides the number of red blood cells is about 4,000,000 to 5,000,000, and the number of white blood cells is 8,000 to 10,000.

If one has an abscess, the white blood cells as a rule will rise to 15,000, 20,000, 25,000 or more to the cubic millimetre—a condition that we know scientifically as "leucocytosis." In certain cases when it is a question whether an abscess exists (as, for instance, in the brain, in the liver, and other parts of the body in which the diagnosis is very difficult to make) if the leucocytosis or its absence will show us absolutely that there is or is not an abscess present, it would be of the greatest help.

Again, in typhoid fever the pain and tenderness exist just above the right groin. In appendicitis the pain and tenderness exist in the same region, and in not a few cases it is extremely difficult to distinguish between these two diseases. Especially is this true at the beginning of such an illness, just when it is most important to make the right diagnosis and institute the correct treatment. If the presence of leucocytosis will show us distinctly that it is appendicitis, and the absence of leucocytosis that it is typhoid fever, an immense gain in accuracy of diagnosis, and, therefore, of the proper treatment, will result. To open the abdomen, if it is typhoid fever (without perforation), would be a dreadful mistake; not to open it, if it is appendicitis, would be, as a rule, equally wrong treatment. If the leucocytosis is a sure guide we cannot learn it too quickly. It seems very reasonable, therefore, that experiments should be made in the lower animals by producing abscesses and determining whether under many varying conditions leucocytosis is always present

VIVISECTION

when there is an abscess and always absent when there is no abscess.

Second, the hemoglobin, which makes up the bulk of the red blood cells, is the means by which oxygen is carried to all parts of the tissues. Whenever an anesthetic, such as ether or chloroform, is given, the amount of hemoglobin is distinctly diminished, and by this means the oxygenation of the blood is hindered. In certain conditions of the system the percentage of hemoglobin is diminished to 60, 50 or even as low as 25 per cent of the normal. If an anesthetic is given to a person with an already diminished percentage of hemoglobin this percentage is still further diminished, and the oxygenation of the blood still further hindered. If, then, the percentage of hemoglobin is very small before an operation the danger of giving an anesthetic is very marked; if the hemoglobin is as low as 30 per cent it is very likely that the patient may die upon the table irrespective of the operation, simply because the anesthetic reduces the hemoglobin to such a point that the blood does not absorb enough oxygen to carry on life. Some authorities have stated that we ought never to give ether or chloroform to a patient whose hemoglobin is below 50 per cent. Others have placed the limit as low as 30 per cent. Surely this subject which is very recent and about which we know up to this time very little, ought to be investigated with the greatest care in animals rather than to decide the question by sacrificing life by venturing to give an anesthetic to patients whose hemoglobin is at so low a point as to be inconsistent with safety.

Other recent researches are those on the temperature at which the blood freezes and the lapse of time after the blood is drawn from the body before it coagulates—that is, clots. A small portion of blood drawn by a prick of the finger enables us to determine these four conditions—that is, (1) the presence or absence and the degree of leucocytosis; (2) the percentage of hemoglobin; (3) the freezing temperature of the blood, and (4) the coagulation time of the blood. We are beginning to see that these last two as well as the first two will probably prove of the greatest value in reference to surgical operations. Hence we ought to learn accurately and quickly all the facts in the case by experiments upon animals, and so avoid dangers to human life, of which until lately we have been quite ignorant.

These would include experiments upon animals fasting, or after feeding; after being bled; after surgical operations have been done upon them; after an anesthetic is given to them; when the anesthetic is administered for a short time, for a longer time, for a very long time, or for a time long enough to kill them, in order to determine what the effect of the anesthetic is in fatal and non-fatal doses. It is of the utmost importance that we should know exactly and speedily the result of all these conditions. If we are debarred from learning them by experiment on animals, then the human race must go without the knowledge we seek, saving as it is revealed to us from time to time by studying slowly and inaccurately the results in man. With certain modifications due to the slight differences between man and animals the conclusions drawn from experiments on animals apply to man.

Let me give one instance which confronts

the surgeon not infrequently. An abdominal section is occasionally followed by very great and, it may be, dangerous and alarming depression. One of the most difficult things to determine in some cases is whether this condition is due to the shock of the operation or to internal hemorrhage. This hemorrhage differs from that which may follow an amputation or removal of a tumor from the neck, etc., by the fact that it is concealed within the abdomen, and its existence can only be inferred. If the patient is suffering from shock, stimulation, heat, quiet, certain drugs, etc., will be resorted to to enable him to recover. If it is due to internal hemorrhage, we must instantly reopen the abdomen and tie the bleeding vessel. To do the latter operation when the patient is only suffering from shock might prove fatal; not to do it, if hemorrhage is the cause of the depression, is certainly fatal. No one not a surgeon can appreciate the anxiety, the careful weighing of evidence, the intense longing for some positive means by which a correct diagnosis may always and surely be made, which every surgeon feels in such an emergency.

It is possible that by examining into the presence or absence of leucocytosis, by determining the percentage of the hemoglobin, or possibly even the coagulation time and the freezing temperature of the blood in a number of operations in human beings, we might be able positively to determine the difference between shock and internal hemorrhage, but only after making many blunders, each of which would cost a human life. In an animal we can open a blood-vessel in the abdomen and let it bleed for a longer or shorter time, and determine positively the leucocytosis, the hemoglobin, etc., the animal meantime suffering nothing because it would be under an anesthetic. Which is the right, which the kindest, which the most humane way of finding out the truth? This is an illustration of the painlessness to animals of such experiments and their priceless value to human beings.

Experiments to Enable us to Make a Reliable and Speedy Diagnosis.—In some cases in which the diagnosis is difficult, or may require considerable time, experiment upon animals aids us greatly, and so is of immense value to man. Thus in supposed anthrax, or wool-sorter's disease, a most dangerous malady, by inoculating a guinea pig with the discharge the diagnosis can be cleared up quickly and proper treatment instituted. If a case suspected to be one of bubonic plague arises the diagnosis can be established within 24 or 36 hours by a similar injection into a rat or a guinea pig, the apprehensions of a community (to say nothing of the patient and his friends) relieved and the greatest damage to its commerce averted by discovering that it is not the dreaded pestilence, or, if it is the plague, by showing the necessity for most stringent measures of prevention. I do not think any community will or ought to allow sympathy with the unavoidable suffering of a few rats or guinea pigs to weigh in the balance against the safety of many human lives or the ruin of large business interests.

An amusing instance of how sentiment gives way before affection and facts occurred not long since in England. The brother of the Duke of Newcastle was bitten by a dog supposed

VIZAGAPATAM — VIZCAINO

to be rabid. The duke was a vice-president of the Anti-Vivisection Society, but knowing that whether the dog was rabid or not (and, therefore, whether his brother was in danger or not) could only be settled by inoculation experiments upon animals, he took the dog to Mr. Horsley, in London, and had the experiment done—and promptly was compelled to resign his office in the society.

By similar means anthrax and actinomycosis (or lumpy jaw, which spreads to man as well as to herds) among cattle are diagnosed and eradicated; glanders in horses is recognized and stamped out and tuberculosis in cows is eradicated, not only preventing its spread to healthy cattle, but through the milk to many human beings, especially young children, whose chief diet must be milk.

By similar experiments on animals chicken cholera, hog cholera, Texas fever, cattle plague, and many other diseases of cattle, sheep, horses, hogs, poultry, and other animals have had their causes discovered and the means of prevention or of cure demonstrated. The reports of the Bureau of Animal Industry at Washington enter into these in detail. Surely the poor animals which have benefited so greatly from such experiments should pray to be saved from their friends if these beneficent researches are to be prohibited.

I often wonder what would have been the influence on surgery if the young man who first took ether in the Massachusetts General Hospital on 16 Oct. 1846, had died. Morton, it is true, had experimented on some dogs first, but, as we now view it, very inadequately. Had this patient died, would not the use of ether have been deferred for years, possibly even till now, and meantime the human race all over the world have gone on suffering the horrible tortures of the pre-anesthetic days and all our modern progress in surgery have been prevented?

If the sacrifice of the lives of even a considerable number of animals enables us to reach the benevolent purposes a few of which I have described, is it not plainly a moral duty to perform them so as to obtain this knowledge? Is it not wrong to hinder such benevolent researches? Especially is it not wrong so to hinder research when, in the vast majority of instances, animals suffer little or nothing? In almost all experiments not only can an anesthetic be used, but in all involving difficult and delicate operations it is essential to do so; for it is impossible to do such an operation on an animal struggling from pain. Not only, therefore, does sentiment lead the vivisectionist to spare the animal all the suffering that is possible, but scientific accuracy points in the same direction. A very few experiments, principally those on the nervous system which require us to determine the presence or absence of sensation, cannot be done with an anesthetic; but these experiments are few and far between. Some experiments also (for instance, those on lockjaw, to which I have already alluded) by producing the disease, necessarily make the animal suffer; but if by the suffering of a few animals, human beings suffering from lockjaw can be cured, or, still better, if we can learn the cause of the disease and so can prevent it from attacking human beings, is it not worth the suffering? The infliction of suffering is not cruelty. If one dear to us meets

with an accident far away from surgical aid and we spur a horse to the utmost, so that finally it drops dead in the frantic effort to bring surgical assistance, I am sure no one would accuse us of cruelty, although we had inflicted torture upon the horse. So this infliction of pain on a small percentage of animals experimented on is not cruelty, but is the greatest kindness to other animals and to a much higher animal—man himself.

I have been able in this paper only to select a few illustrations of the progress that surgery has made by experimentation on animals. Practically, as I said at the beginning, nearly all of these have occurred during my own professional life, and I speak, therefore, of what I know. Although I myself am not a vivisectionist, yet I could not do the work I do every day and accomplish results I do were it not for just such work, of which I take advantage. In view of these facts, therefore, how unwise it would be to restrict and still more to abolish such life-giving and pain-saving results of vivisection, especially when the animals themselves benefit from these experiments almost as much as man. I have not referred to any of the older experiments, such as those remarkable experiments of Jones on the methods of tying blood-vessels in the early part of the last century, nor of Sir Charles Bell's experiments by which he determined the functions of the two different roots of the nerves just as they emerge from the spinal cord, nor of the circulation of the blood as discovered by Harvey. All these are fundamental; and without the knowledge derived from them we should be a century or more behind where we are now. I have preferred rather to take modern instances with which I am personally familiar in order to illustrate the subject which I have been asked to describe. I cannot believe that any unprejudiced, fair-minded reader will not agree with me that such humane purposes should be fostered and not hindered; should be encouraged and not abolished.

W. W. KEEN, M.D.,
Professor of Surgery, Jefferson Medical College, Philadelphia.

Vizagapatam, vē-zā'gā-pa-tām', India, a town, capital of a district of the same name, in the Madras Presidency, at the entrance of the Veragatam into the Bay of Bengal, about 180 miles northeast of Masulipatam. It is a military station and has a good harbor, a modern water supply, sanitary system, hemp manufactures, and an export trade in rice and sugar. Pop. (1901) 40,892.

Vizcaino, vēth-kā-ē'nō, **Sebastian**, Spanish navigator: b. Huelva, about 1550; d. Acapulco, Mexico, about 1615. After being prominent in Mexico he headed exploring expeditions from Acapulco to Lower California, 1596-7, and in 1602-3 along the California coast to latitude 43°, discovering the bay which he called Monterey, and sent a vessel which appears to have reached the mouth of the Columbia. He also sailed to Manila and Japan, 1611-14, carrying Franciscan missionaries to Japan, and was the earliest to attempt to establish commercial relations between Spain and Japan. His reports of his voyages to California were printed in Torquemada's 'Monarquía Indiana' (1615), and the greater share of his narratives, including that of

VIZETELLY — VIZIER

his voyage to Manila, was included in De Navarrete's 'Coleccion de Viajes y Descubrimientos' (1625-9).

Vizetelly, vîz-ê-těl'i, Edward Henry ("BERTIE CLARE"), English journalist and war correspondent, son of H. R. Vizetelly (q.v.): b. Chiswick, England, 1 Jan. 1847; d. London 13 April 1903. He was educated at the Imperial Lyceum, Saint Omer, France. At the outbreak of the Franco-Prussian war he became special correspondent for the New York *Times* and the London *Daily News*, served as orderly officer on the staff of Garibaldi, and was present at Dijon and at Langres; subsequently he engaged in the Kabyle insurrection of 1871, served in the Russo-Turkish war of 1877-8 and in the Greek insurrection of the latter year. He founded the *Cyprus Times* in 1881 and the *Times of Egypt* at Alexandria in 1882. At the bombardment of Alexandria on 11-12 July 1882 he was the only Englishman in the city, and during the firing sent half-hourly despatches to London. In 1888 he commanded the New York *Herald* relief expedition sent in search of Stanley in Africa, and met him in East Africa in 1889. He was the author of 'Reminiscences of Bashi Bazouk'; 'From Cyprus to Zanzibar'; 'The Warrior Woman.'

Vizetelly, Ernest Alfred, English journalist and editor, son of H. R. Vizetelly (q.v.): b. London 29 Nov. 1853. He was completing his education in Paris when the Franco-Prussian war broke out and he became correspondent for the *Yorkshire Post*. After the close of the war he accompanied his father in the capacity of artist through Austria, Spain, Portugal, and Italy until 1886, when he joined the editorial staff of Vizetelly & Company. Subsequently he engaged in journalism, and has translated into English the greater part of Zola's works. As a novelist he has written 'The Scorpion' (1894); 'A Path of Thorns' (1901); and 'The Lovers' Progress' (1902). He edited an edition of 'The Hep-tameron, English Bibliophilists,' planned by his father (5 vols., 1894); his other publications include: 'The True Story of Chevalier d'Eon' (1895); 'Bluebeard, Comorre the Cursed, and Gilles de Rais' (1902); 'Emile Zola, a Biography' (1904).

Vizetelly, Francis (Frank) Horace, son of H. R. Vizetelly (q.v.), American editor and encyclopedist: b. London 2 April 1864. He was educated at the Lycée Baudard, Nogent-sur-Marne, France, and at Arnold College, Eastbourne, Sussex. From 1888 to 1891 he was engaged in business with his father at London, and in the latter year came to the United States. In 1891 joined the editorial staff of the 'Standard Dictionary,' for which he prepared the definitions on wines, and from the date of the publication of that work was the assistant of the editor-in-chief in all subsequent editions issued, revising the entire work for the edition of 1903, when he became associate editor. During 1893-4 he filled the position of associate editor of the 'Home and Country Magazine,' was revising editor of the 'Columbian Encyclopedia' in 1896, of the 'Cyclopedia of Classified Dates' in 1899, and also was one of the editors of Hoy's 'Cyclopedia of Practical Quotations.' He investigated in 1901 the conditions prevailing in the Boer detention camp at Bermuda, the only civilian accorded that privilege by the British authorities, and published his report in the leading Amer-

ican and English newspapers. He is secretary of the editorial board of the 'Jewish Encyclopedia' and manager of the editorial department of that undertaking. Among his writings are: 'The Story of the Wheel' (1898); 'The Fan in Romance and History' (1898); 'The History of the Glove' (1899); 'The Boer as a Prisoner of War' (1901); 'The Crime of the Congo' (1903); etc.

Vizetelly, Henry Richard, English newspaper proprietor, editor, publisher and writer; b. London 30 July 1820; d. Tilford, near Farnham, England, 1 Jan. 1894. He came of a family of printers and stationers, was educated at Clapham and at Chislehurst, and was later apprenticed to a wood-engraver, an art in which he became proficient, his most notable work as an engraver being a series of illustrations drawn by Birket Foster (q.v.) for Longfellow's 'Evangeline.' He took a prominent part in founding 'The Illustrated London News' in 1842, and was one of the founders of the 'Pictorial Times' in 1843, a pioneer enterprise in illustrated journalism, published the first English edition of 'Uncle Tom's Cabin' in 1853; established the 'Illustrated Times' in 1855; the 'Welcome Guest' in 1858; and in 1865-76 was correspondent of the 'Illustrated London News' at Paris and at Berlin. He was appointed representative of the British government on wines at the Vienna Exposition in 1873 and at Paris in 1878, and for his labors at the former was created by the Austrian emperor chevalier of the Order of Franz-Joseph of Austria. In 1880 he established a publishing house in London, and engaged in issuing translations of the works of foreign authors, chiefly Russian and French, and in 1884 began to publish translations of the works of Emile Zola. The literal translation of the works of the novels of the French realist, however, aroused a storm of protest, and in 1888 he was indicted on the charge of publishing obscene libels, and, on the advice of counsel, pleaded guilty and agreed to withdraw the edition of Zola's works. Thereupon he was fined £100 (\$500) and required to enter into his own recognizances to be of good behavior for a period of six months. In 1889, in harmony with his understanding of the undertaking given, he decided to issue an expurgated edition of the works of Zola. Notwithstanding the deletion of all the passages to which objection had been raised, he was indicted a second time, and, being then 71 and broken in health, he, following advice of counsel, again pleaded guilty, and was sentenced to three months' imprisonment as a first-class misdemeanant. His writings include: A series of monographs on wines, entitled 'Wines of the World' (1875); 'Facts about Sherry' (1876); 'Facts about Champagne' (1879); 'Facts about Port and Madeira' (1880); 'The Story of the Diamond Necklace' (2 vols., 1867); 'Berlin under the New Empire' (2 vols., 1879); 'Paris in Peril' (3 vols., 1882); and two volumes of literary reminiscences; 'Glances Back through Seventy Years' (1893); etc.

Vizier, vî-zēr', a title given to high political officers in the Turkish Empire and other Mohammedan states. In Turkey the title is given to the heads of the various ministerial departments into which the divan or ministerial council is divided. The president of the divan or prime minister is known as grand vizier.

Vladikavkaz, vlā-dē-kāv-kāz', Russia, a fortified town in Caucasia, capital of Terek district, situated on an elevated plane at the northern base of the Caucasus, about 90 miles north of Tiflis, with which it is connected by a military road through the Dariel gorge. It is connected by rail with Rostov and with Petrovsk on the Caspian, and is rapidly developing as a commercial centre. Pop. (1897) 43,843.

Vladimir I., vlā'dī-mīr or vlā-dē'mīr, **Saint**, "the Great," Russian emperor, son of the Grand Duke Sviatoplav: d. Bérésyx, Russia, 1015. He received from his father in 972 the government of Novgorod, notwithstanding his illegitimacy, and the remainder of the empire was divided between the lawful heirs, Jaropalk and Oleg. Jaropalk killed Oleg in a quarrel in 977, and Vladimir escaped a similar fate only by flight. In 980 Vladimir returned with an army, overthrew and caused the assassination of Jaropalk, and became sole ruler of the empire. He then extended his boundaries from the Black Sea to the Baltic, and founded his capital at Kiev. While besieging the Christian city of Cherson in the Crimea he decided to demand the hand of Anna Romanovna, sister of Constantine IX., the Byzantine emperor, in return for a cessation of hostilities. The demand was granted, and by this princess Vladimir was converted to Christianity. The Greek Church was established in Russia, and Vladimir's subjects willingly embraced the new faith. The character of the emperor seems completely to have changed after his conversion. He built churches and monasteries, abolished capital punishment, and in his private life substituted chastity for the former licentiousness. He divided his empire among his 12 sons, and after his death was canonized in the Greek Church, while in 1782 the "Vladimir Order" was founded by Catharine II. Consult Karamzin, 'History of Russia' (1816).

Vladimir II. Monomachus, Russian emperor, great-grandson of Vladimir I.: b. 1052; d. Kiev, Russia, 19 May 1126. Contrary to the Slavonic law, he succeeded to the throne in 1113. He possessed both valor and ability, and under his wise rule Russia enjoyed a period of great prosperity. He married Gida, daughter of Harold of England, and the famous Valdemar of Denmark was his grandson. He wrote a "Testament," which is valuable as a picture of the manners and opinions of the day. Consult Rambeau, 'History of Russia' (1886).

Vladimir, Russia, (1) a town, capital of the government of same name, on a lofty and wooded bank above the Klyazma, 105 miles northeast of Moscow. It is one of the oldest towns in Russia; and has a 12th century cathedral, a theological seminary, considerable manufactures, and a trade in fruit, particularly cherries. From 1157 to 1328 it was the residence of the Russian grand princes. It was twice sacked in 1238 and 1410 by the Tartars. Pop., 28,315. (2) The government has an area of 18,864 square miles. It has an undulating surface with a general slope toward the east, and is not very fertile. The drainage is all carried to the Volga by the Oka and its tributary, the Klyazma. The province is rich in archaeological remains of the Paleolithic and subsequent ages. There are important manufactures of linens and woollens and several blast-furnaces. Pop. (1897) 1,570,733.

Vladivostok, vlā-dē-vōs-tōk', Asiatic Russia, a fortified seaport town of Eastern Siberia, on the harbor of the Golden Horn in the Gulf of Peter the Great, Japan Sea. It was founded in 1861, and is an important naval station of Russia, and the eastern terminus of the Trans-Siberian Railway, the first sod of which was cut at Vladivostok, 24 May 1891, the line being opened in December 1901. The harbor is surrounded by hills which are well fortified. It has large dry docks, waterworks, electric street railways, and street lighting plants, two large shipbuilding yards, and 60 new mechanical shops. Vladivostok is an open port, and has lines of steamers running to Japanese and Korean ports and a line opened in 1900 to Seattle, Wash. Ice-breaking steamers keep the harbor open in the winter months. A Japanese squadron bombarded Vladivostok early during the Russo-Japanese war of 1904, but without inflicting any serious damage. Pop. (1901) 38,000, including nearly 25,000 soldiers, and numerous Chinese, Japanese and Koreans. See TRANS-SIBERIAN RAILWAY.

Vod'ka, a Russian intoxicating liquor, distilled from rye, and much used by the peasants of Northern Europe.

Vogdes, Israel, American soldier: b. Wiliston, Pa., 4 Aug. 1816; d. New York 7 Dec. 1889. He was graduated at West Point, and served in Florida against the Seminole Indians in 1849-56. He was captured by the Confederates 9 Oct. 1861, while repelling their attack on Santa Rosa Island, Fla.; released in August 1862; and as brigadier-general of volunteers commanded Folly Island, S. C., in April-July, 1863. He was promoted colonel, U. S. A., 1 Aug. 1864; commanded the defenses at Portsmouth and Norfolk in 1864-5; was brevetted brigadier-general, U. S. A., in April of the year last named; and was retired at his own request in January 1881.

Vogel, fō'gēl, **Eduard**, German explorer: b. Crefeld, Prussia, 7 March 1829; d. Wara, Wadai, 8 Feb. 1856. He was educated at Leipzig and at Berlin, making a special study of astronomy and natural science. In 1851-3 he assisted Hind at Bishop's Observatory in London, and in the latter year was selected by the English government to conduct an expedition to join that of Clapperton, Barth, and Overweg in Central Africa. He sailed from England 20 Feb. 1853, and on 13 Jan. 1854 reached Kuka, the capital of Bornu. From this point he made several expeditions into the surrounding country, and on 1 Dec. 1854 met Barth near Zinder. He penetrated south to Yacobi and the Benue, and on 1 Dec. 1855 returned to Kuku. From this time his notes of his explorations cease, but subsequent information discloses that he set out to the east on 1 Jan. 1856, reached Wara in Wadai, and was there assassinated. For his notes consult 'Erinnerungen an einen Verschollenen,' by his sister, Elise Polko (1863); also Pahde, 'Der Afrikaforscher Eduard Vogel' (1880).

Vogel, Hermann Wilhelm, German photochemist and spectrum-analyst: b. Dobrilugk, Lower Lusatia, Prussia, 26 March 1834; d. Berlin 17 Dec. 1898. He studied at the Royal Industrial Institute of Berlin, in 1860-5, was an assistant in the mineralogical museum of the University of Berlin, and from 1884 was director of the photo-technical laboratory of the

VOGEL — VOICE AND VOICE CULTURE

Technical Institute there. He twice visited the United States (1870, 1883). His studies were directed in particular to the processes of photochemistry, the absorption-spectrum, and the spectra of oxygen, nitrogen, and hydrogen. His silver-tester, photometer for pigment-printing and heliotype-printing, and universal spectro-scope were introduced into general use. Among his writings was a 'Handbuch der Photographie' (4 ed. 1890-4).

Vogel, Sir Julius, Australasian statesman: b. London 24 Feb. 1835; d. near there 12 March 1899. He was educated at the London University College School and at the Royal School of Mines, and in 1851, attracted by the discoveries of gold in Australia, went to Melbourne. He engaged in journalism, and in 1861 established in Otago, New Zealand, the *Daily Times*, the first and still the leading morning newspaper in that colony. In 1863 he entered the New Zealand House of Representatives and in 1869 he was appointed colonial treasurer, and subsequently was postmaster-general, commissioner of customs, and prime minister. He resigned the latter office in 1876 and was agent-general for New Zealand in London in 1876-81. In 1884 he re-entered New Zealand politics, was elected to Parliament and again appointed treasurer, but in 1888 resigned and returned to England. He was afterward engaged under the New Zealand government in London until his death. He greatly furthered immigration to New Zealand, was instrumental in building railways, was active in bringing about the Australian federation, and secured the passage of a law for inscribing colonial stocks. He was knighted in 1875. His writings include: 'Great Britain and Her Colonies' (1865); 'Official Handbook of New Zealand' (1875); 'A. D. 2000,' a novel; etc.

Vogelweide, fō'gēl-vī-dē, **Walther von der**. See WALTHER VON DER VOGELWEIDE.

Vogler, fō'glēr, Georg Joseph, German musician and composer, known as the "ABBÉ VÖGLER": b. Würzburg 15 June 1749; d. Darmstadt 6 May 1814. He studied at Bamberg, Mannheim, Bologna, and Padua; was ordained priest at Rome in 1773; and made Knight of the Golden Spur, and prothonotary apostolic and chamberlain to the pope. Returning to Mannheim in 1775 he established there his first school of music. From 1786 to 1799 he was nominally resident at Stockholm, where he conducted another Tonschule; but he was constantly touring Europe as a performer on the organ. In 1807 he settled at Darmstadt as kapellmeister, and there conducted his most successful school, at times giving concerts in German cities. Vogler made a great stir in his time as theorist and organist, not being excelled on the instrument. He attempted revolutions in organ-building. He is known as the subject of Browning's 'Abt Vogler.'

Vogt, fōkt, Karl, German naturalist: b. Giessen, Germany, 5 July 1817; d. Geneva, Switzerland, 5 May 1895. He was graduated from the University of Bern in 1833 and was associated with Agassiz in the preparation of 'L'Histoire naturelle des poissons d'eau douce de l'Europe centrale' in 1839. He was appointed professor at Giessen in 1847, where his political opinions soon caused his dismissal, but in 1852 he was chosen to the chair of geology at

Geneva, which position he occupied until his death. He led an expedition to the North Cape in 1861 and in 1878 was elected a member of the Swiss National Assembly. He was an advocate of Darwinism and a materialist in opinion. His works include: 'Physiologische Briefe' (1845-6); 'Ocean und Mittelmeer' (1848); 'Die Säugethiere in Wort und Bild' (1883); etc.

Vogüé, vō-gü-ä, Charles Jean Melchior, MARQUIS DE, French archæologist: b. Paris 18 Oct. 1829. He was a student of Oriental religion, languages, and art, traveled in Syria and Palestine in 1853-4 and 1861-2, was ambassador at Constantinople in 1871-5, and from then until 1879 occupied that office at Vienna. He became commander of the Grand Legion of Honor in 1879, was elected to the French Academy in 1901 and is president of the Agricultural Society of France. His publications include: 'Les Eglises de la Terre-Sainte' (1859); 'L'architecture civile et religieuse dans la Syrie Centrale' (1865-77); 'Inscriptions sémitiques' (1869-77); 'Mémoires de Villars' (1889); 'Le Duc de Burgoyne et le Duc de Beauvilliers' (1900); etc.

Vogüé, Eugène Marie Melchior, VICOMTE DE, French critic and historian, cousin of C. J. M. Vogüé: b. Nice, France, 25 Feb. 1848. He was educated at Paris, served in the Franco-Prussian war, entered the government service in the department of foreign affairs in 1871, was attaché at Constantinople in 1873, secretary of the legation at Saint Petersburg in 1876, and in 1882 resigned to enter upon a literary career. He was elected to the Academy in 1888 and in 1893-8 was député de l'Ardèche. His publications include: 'Syrie, Palestine, Mont Athos' (1876); 'Les portraits du siècle' (1883); 'Le Roman russe' (1886); 'Cours russes' (1894); 'Jean d'Agrène' (1898); 'Le rappel des ombres' (1900); etc.

Voice and Voice Culture. The art of singing was developed to meet the demands of modern music. That which we understand as the science of voice culture, or the means of cultivating the singing voice that it may be used as a musical instrument, came into being after music had shaped itself to express strong emotional sentiment. In the closing years of the 16th century the attempt to restore Grecian art in its several branches led to the invention of new forms of musical expression. Previous to that time, little, if any, music was written for the solo voice. There was no demand, therefore, for especial training for singing. The new forms given to music were (1) the opera, in which dramatic action was united to musical setting of the story. The story was given out by single voices, by two in dialogue, by three, four or more in unison or harmony. The plot of the opera was, from the beginning, in comedy or tragedy and secular in nature; (2) oratorio, which certainly at first was much like the opera, except that the story was from sacred writ. A form of composition invented at this time was recitative which was, and ever has been, for the single voice. Advances in these forms of composition have exacted more and more of singers. Invention of modern music created the need of special training of the singing voice and advance into larger forms of musical expression has kept the demand for

VOICE AND VOICE CULTURE

greater skill on the part of vocalists ever increasing. As modern music came into recognition in Italy (in Florence, about the year 1600) the first definite system of voice culture began there. It was devised by the composers that their operas and oratorios might be sung as they wished them sung. There was no definite plan accepted for general use during the first century of modern music.

Every composer sought some means by which to have his compositions well sung, and each followed his own course. In 1686 was born one destined to establish a semblance of order. Niccolò Porpora, born at Naples, became a composer. His operas were very florid and none were found among singers able to cope with them. His earnestness for his own interests made him, an educated man for his age, devise a better system of vocal training than had ever been used. And for the first time was established a vocal method. It was the beginning of the Old Italian method, some form of which was continued to our own time. Unfortunately, Porpora left no record of his manner of teaching. We must judge what he did from the demand his music made. His writing for solo voices called for great flexibility and range of voice and his phrases were of great length. We must suppose from this that his pupils were taught to sustain the breath a long time, to sing smoothly and rapidly and to touch with delicacy and lightness the notes in the extremes of the voice. Probably his personality was commanding and that he curbed with masterful hand all attempts on the part of his pupils to depart into anything outside these few requirements. Farinelli, one of his greatest pupils, departed from the simplicity of Porpora's rules, but not until after Porpora passed away. It is known that Porpora kept his pupils many years at work on the simplest exercises. It is related that Caffarelli, one of his most noted pupils, studied a single page of exercises for seven years and when he finally became restless, the master said: "You may go now; you are the greatest singer in Europe." Perhaps one reason why so little is known of Porpora's vocal method is because he did not remain long enough in one place to found a school which could preserve records. He wished for fame as a composer and went from city to city to make his works known. His pupils followed. That, on the other hand, spread the good vocal teaching. In every large city of Italy and in many Austrian and German places the effect of his good teaching was felt. Porpora lived till 1767 and will ever have the honor of establishing vocal method. It was not, so far as we know, scientific, yet it was definite and could be understood. His pupils who continued at Naples maintained his traditions conscientiously for a century. Others who were attracted to London, Paris and Vienna kept up a form of Porpora's vocal method. Farinelli, after a wonderful career as singer and politician (having been the power behind the throne of Philip V. of Spain), retired to Bologna where he passed the last 23 years of his life. Bologna had the honor of establishing the first great music school (which began in 1482) and was the musical centre of the day. Farinelli did not become a singing teacher by making it his profession, but he trained many of the singers who were connected with the theatre. In this

way, he more than any other, handed down the Porpora method. Nearly all the composers of the day came into contact with that method and for the first time in the history of music, vocal method influenced composition. Mozart had singing lessons with pupils of Porpora. Haydn was accompanist to Porpora for three years. Rossini was born into the Bologna life. Bellini, Donizetti and Mercadante were all educated at Naples where the traditions were most rigorously preserved.

Into our own day the influence of the Old Italian method has been projected through two distinct lines: that of Francesco Lamperti and of Manuel Garcia. Each has, perhaps, departed from the old rules, necessitated by the changed conditions of music. Before considering the work and vocal methods of these two men it is well to see if in the remark of Mancini, himself a great singing teacher and a fellow pupil of Farinelli, we may gain a little more definite knowledge of the principles of Porpora. Mancini says regarding Farinelli, "The art of taking and keeping the breath, so softly and easily that no one could perceive it, began and died with him. The qualities in which he excelled were the evenness of his voice, the art of swelling its sound, the *Portamento*, the union of the registers, a surprising agility, a graceful and pathetic style and a shake so admirable as it is rare." So far as known there is no more complete description of vocal method of that day.

Lamperti, judging from his pupils who are very well known, kept most closely to that method. He was born in 1813 and when seven years of age entered the Conservatory at Milan for the study of piano and composition. He was ambitious to manage opera companies when he became a man and shaped his training for the theatre. He associated himself, eventually, with the manager of the small theatre at Lodi. That seems to have been his only venture in theatrical management, but it served to shape his life in an unexpected manner. Financial resources being small he was forced to train the local singers for the solo parts. He was so successful that many of those peasants attracted attention and were engaged for the theatres of London, Paris, Saint Petersburg and other European cities. It makes the most striking example in history of the power of one man to create a school of singing. Their successes led many great artists to visit Lamperti at Lodi, and his popularity caused the government to make him professor of singing at the Milan Conservatory in 1850. For the next 25 years many of the greatest singers studied with Lamperti and this made Milan the centre of the operatic world. In 1875, Lamperti was retired on a pension, but continued as a private teacher until his death in 1893. Even Lamperti did not write a vocal method. Mr. Griffith, one of his earnest pupils, gathered slips of paper on which he wrote comments for his pupils and from them has given us a little idea of the method. One remark by Mr. Griffith is, "Basing his teaching upon the study of respiration, the taking and retention of the breath by means of the abdominal muscles alone, and the just emission of the voice, he thoroughly grounds his pupils in the production of pure tone." That is not unlike the remark of Mancini about Farinelli's method. If the Old Italian method has come into our

VOICE AND VOICE CULTURE

day in any degree of purity it has come through the adherence of Lamperti to those principles of breath control.

Manuel Garcia, Sr., was born eight years after Porpora died. In 1812, when 37 years of age, he studied at Naples under Anzani, who was particularly zealous in preserving traditions. Garcia, too, was to be an impresario and his thought was given to the training of singers for his own companies. But, with these duties, he saw the advantage of having a school at London. This was established in 1823. His own children were trained by him and three of them became celebrated. Maria, known as Mme. Malibran, was one of the greatest singers of any age but lived to be but 28 years of age. Mme. Viardot-Garcia, still living at Paris, was born in 1821. She served as accompanist for her father and learned his method more from absorption than from actual lessons. She grew up in the highest musical life of the day. Manuel Garcia, Jr., was born in 1805, still living at London, became one of the most important men in connection with vocal method. He sang for a few years in his father's companies, but elected to adopt teaching as a profession. He was one of the first men to become a vocal teacher who did not have special interest in producing his own operas or in preparing singers for his own companies. It is probable that he has the honor of establishing the vocation of voice teaching on professional lines. Whether that be so or not he made scientific investigation of the voice on which he established a distinct vocal method. He invented the laryngoscope, a device for examining the throat, including the vocal chords and larynx. This has become universally adopted by physicians. Garcia was able, with his examinations, to announce definite facts about the action of the throat in singing. Action had been observed previously through sensation and because it had manifested itself through the outer flesh. It is worthy of remark that although earlier teachers were obliged to walk by faith rather than by sight they had not gone far from correct ways. Nor did Garcia's discoveries add much knowledge. It permitted him and his followers to move with greater certainty. It led to the formation of vocal method on the idea of tone-placement. The registers of the voice assumed more definite position as factors in method. Whether Garcia became so interested in the scientific action of tone production and its reflection in chambers of resonance, as to obscure his views of respiration, or whether he became convinced that respiration was not important, does not appear. But he ignored very thoroughly that which was fundamental in Lamperti's work. He established a method with new basic principles, and that method sprang into popularity. At that time in the history of vocal method there were two distinct systems: one based on empiricism; the other on science. The first took into account the sound of the tone and judged what would make it good; the other explained the scientific action which would produce good tone. As each method has produced many noted artists there need be no comment on the merits of either. The advocates of both schools have held quite closely to the tenets of the two great leaders, although modifications, as well as additions, have been made. Modern music continues its greater demands and dis-

coveries in science compel further adjustment of deductions based on scientific vocal research.

In 1845, Mathilde Graumann, now Madame Marchesi, became the pupil of Garcia, the inventor of the laryngoscope. For a time she acted as assistant to Garcia and, as it was just the time of Garcia's deep study which led to the establishment of a new vocal method, it is reasonable to suppose that she was influenced by that in forming her own. Her husband, Salvatore Marchesi, was also a pupil of Garcia. The "Marchesi" method is more often mentioned than is any other to-day and it has the Garcia principles for its foundation. Many of the great opera singers have been guided in their education by Madame Marchesi. It is, however, a matter of comment that these artists differ radically in vocal method, and probably the teacher has considered the individuality of her students more than she has adherence to vocal method. Nor would this necessitate departure from Garcia's principles, for such is the subtlety of the mind in dealing with vocal machinery, there is always need of adaptation of method to traits of mind which are individual. And that ability so to adapt may constitute the "Marchesi" method. It may be even the establishment of a new method.

Italy, ever the home of opera, has adopted vocal method which more dramatic music demands. Language is a factor in creating or changing vocal method. The flowing tone of the Italian, with every word ending in a vowel or liquid consonant and with guttural and harsh consonantal combinations almost eliminated, does not lend itself well to the tone placement of the Garcia school. Nor is the method of Lamperti sufficiently vigorous to meet dramatic demand. A compromise seems to have been effected. Breathing is the basis of it, and it is the breathing of the upper chest, with the abdominal muscles held inward with great firmness. This enables its votaries to utilize to a certain extent the scientific tone placement of Garcia. The combination leads to tone production with a degree of harshness which was foreign to the older Italian method. Few professional singers have become prominent under its leading.

Opera demanding extremely dramatic voice has found favor in Germany, and vocal method has been devised on lines which are not part of either of the older schools. Nor is it possible to make explanation of the German method on scientific grounds. The voice is used explosively and with less attempt to sustain the smooth flow of tone which has ever been deemed essential to good singing. Yet the public has learned to enjoy German singing, which is most convincing proof that there is reason for it. Wagner, it is said, did not hope that his operas would ever be sung well nor could they be given in any school of voice training which existed when they were written. In the German method of training the voice is found a way by which the operas can be sung. And this class of music is the only one to which that method can be applied. Explosive tone is quite out of place in the music of song writers even among Germans.

Language has influenced the formation of a method in vogue among the French singers. The nasal consonants of the French language

VOICE AND VOICE CULTURE

call for decided nasal resonance, and the vocal teachers of Paris seek to obtain such resonance as the predominating factor in tone production. In the department of breathing they exact high chest breath control. With this as foundation and with exaggerated nasal resonance there is shrillness of tone emission. The difference between French method and modern Italian lies in the point of resonance of tone. The Italian places the tone in the forward part of the mouth, and the French in the nasal chambers, while both use high chest breath control as foundation.

The other nations have no distinctive vocal methods. England and America have been content to follow the lead of other peoples. Many individual teachers have, through their strong personality, made reputations as teachers, and the public has accredited them with vocal methods quite their own. Thus, William Shakespeare made international reputation as having a vocal method. In some particulars it is individual, but it is based on that of Francesco Lamperti which was as nearly as can be the Old Italian method.

One system which had no special home but which has scientific basis and has many advocates is the "Overtone" method. Theory claims that every musical tone is compound in that it consists of the vibration of the tone-producing organ as a whole for the initial tone and the vibration of its aliquot parts as added tone. For example, the tone made by the stroke of the hammer on the piano string vibrates the string its whole length, its half length, quarter length and eighth length. Also, the divisions at the third, fifth, sixth and seventh of the whole vibrate. Sensitive ears can detect the lower multiples of the rate of vibration of the note struck. Using the piano string one can demonstrate the truth of this theory. The tones added to initial tone have been called "harmonics," "upper partials" and "overtones." Some vocal teachers believe the vocal chords have action which corresponds to that of the piano string and have constructed a vocal method which seeks to incorporate upon the initial tone an abundance of "harmonics." Other teachers of the overtone method claim that every part of the resonance chamber of the throat and mouth is a point of birth of "harmonics." They then seek to make junction of these voices with the initial tone made by the vocal chords. One ingenious scientist has shown this theory can be illustrated by a series of flames which register what vibration of aliquot parts is given each tone. Photographs are made of the flames. It makes a visible record which enables a student of sufficient intelligence to direct his practice.

In the studios of vocal teachers "Open and Closed Tone" method is often spoken of, but it is doubtful if a distinct vocal method has ever been built on this idea. Garcia advocated using open tone in the low voice and closed in the upper. Lamperti advised open tone throughout the voice, at least in practice on exercises and vocalizes. It would seem as if "open and closed tone" method is a varying adjunct of several methods, rather than distinct vocal method by itself.

In the last few years a theory has been advanced which may serve as ground for a new method. It is that tone is primordial substance,

present in everything, as is electricity; that by stimulating vibration in the vocal machinery at the proper rate to make audible the tone which is present, our musical tone is produced. Voice culture, in this system, consists of stimulating the sounding machinery at just the right degree of vibration, soliciting above all, such counter balance of effort that the act of singing is unfelt and the appearance of effort hidden. This method further contemplates that transmission of tone is made amplification of the vibration of the vocal machinery.

Examination of all methods of training the voice in vogue emphasizes the belief that none can have universal endorsement. This comes about because there are so many views of music and of the requirements for singing modern music. All unite in saying that singing should be without effort; but such is the difference in perception of sensation that what seems effortless to one appears charged with effort to another. The latter fact points out the need of some scientific measure by which test may be made of this important element in singing. A barometer or thermometer would establish a vocal method. The one to invent such an instrument has not been found. Garcia opened the way for scientific examination of the voice, but no one has advanced in the science and Garcia's discoveries did not create a method generally endorsed. Among vocal teachers it is common saying that there are two vocal methods, the good and the bad. Each believes his to be good, but as they differ very much all cannot be good. All know that breath must be used to create vocal tone; that tone emission must be with comfortable action in the throat; that transmission of tone must be generous and the tone given be vibrant. The way to secure these constitutes good method. Every teacher has his own way by which to attain these desirable ends, and the individuality prevents general acceptance of any one system. Again, vocal teachers who depend on their individuality are little likely to invent any scientific testing machine. Method which can have universal acceptance and application will come only from deductions made by practical teachers working out the suggestions which scientific men make, which will come from invention. The telephone came near showing new forms of transmission and reception of tone. It supplied the idea that tone is awakened into audible vibration and endorsed the teachers of the "Primordial" method. Nor is it certain but that further experiments in which electricity plays an important part will supply views on which to base vocal method. It is a subject of vast importance. In this, vocal methods for singing have been considered because training the voice for that art is supposed to be the most important and extended training the voice can have. When we think of the large number of actors, elocutionists and public speakers and recall that each needs to use true principles of voice culture, the importance of having a definite and universally applicable vocal method seems almost imperative. When we realize that the constantly used conversational voice would be an infinitely more valuable implement of communication between human beings were it cultivated as it might be, the need of perfect (and universal) vocal method assumes large proportions. If, as many believe, voice

VOICE, SPECIAL FEATURES OF ORGANS OF

culture is one of the most valuable prophylactic and therapeutic agents known, such need is absolutely imperative.

Schools of music have been established in all large cities, and of course the study of singing has been made prominent. It has not, as a rule, been the chief study. It has been forced to fourth place, composition, piano and instrumental playing having been given precedence. Wherever the study of singing has been given special prominence it has attracted more students to the school and has made more lasting impression on music. Thus, Lamperti made Milan with its conservatory, noted. The Royal Academy at London has, since the day of Handel, had a large number of great vocal teachers and that has given power to the school. The New England Conservatory and the Chicago College of Music have produced many excellent singers, but the fact remains that none has advocated special vocal method. Training has been on lines widely separated and left entirely to the judgment of individual teachers. As all have produced results, although using means so different, it is evident that training the voice for singing modern music can be had through the personality of the teacher developing the musical nature of the student. This has taken the place of method. Many teachers, in late years, have written treatises on singing and which are intended, although frequently not so claimed, to be descriptions of vocal methods. Garcia's method was described in a book issued about 1865. It has since been revised and simplified. Madame Seiler, Madame Marchesi, and Messrs. Randegger, Behnke and Alberto Bach have described their methods in print. Nor must we forget some very excellent works by American writers. Frederic Root, D. A. Clippinger and Edmund J. Myer have written clearly and well on vocal methods. As their works are the latest and they are men grown into the strong thought of present activity, their writings have definiteness which was lacking in many earlier works. There is a growing belief that American teachers are taking the most advanced position with regard to certainty in method, and that study of singing can best be prosecuted with such teachers. That which is most evident in their work is that they combine scientific with empirical teaching, and they bind the whole together with directing power of intellect and soul. At no time has it been possible to ensure that anyone possessing any degree of vocal resources shall become an acceptable singer as it is now. This is true, in spite of the fact that never before has music demanded so much of singers.

Judging from methods of the past and present we may believe that the voice for singing can best be trained on the following general lines, allowing, of course, that individual natures demand departures and special applications:

There are three general departments: physical, intellectual and spiritual. The latter refers to the intuitional and emotional action of the spirit of man. The physical training has in it development of respiration, freedom of the throat and reverberation of tone. Respiration demands that muscles of inspiration and expiration shall be made free and strong and made to balance their action so as to deliver breath pressure to the vocal chords, which make initial tone, in such way that tone is made without apparent

effort. This corresponds to the way of the Old Italian method. It seems a simple thing, but the old singers evidently found it necessary to study and practise it every day for years and perhaps for lifetime. Freedom of the throat means that tone of every gradation of power, from softest to loudest, shall be emitted in purity; that elasticity of muscle shall permit constant and instantaneous changes in the larynx; that the chambers above the larynx which influence quality shall be supple; and that the organs which regulate articulation shall not be interfered with, even in the slightest degree, while performing their duties. Reverberation has in it the whole matter of tone-placement, vibration and transmission of musical sounds. Such use of physical training draws, then, from the empirical ways of the old school, the scientific method of the Garcia system and the ways of the "overtone" method.

The intellectual department of modern method demands of the student knowledge of anatomy and physiology; directing power of the mind; and familiarity with psychology. Education of the objective mind is the controlling factor in this part of vocal method. To small extent has it been used in any earlier methods. It is probable that in that department the strongest factor in modern vocal method is found. For the intuitional or emotional side has ever been used and perhaps singers of the past (notably Farinelli) cultivated this side to perfection.

Intuitional influence in modern method is not left to chance as possibly it has been before. A real student of our times is led to understand his relation to the controlling force of the universe and to utilize the power he may obtain through what is often termed "higher thought." But it is not left to be expressed "intuitionally." That is, the student learns what imagination, sentiment, will and the like are, and then, through his objective mind (intellectual department) directs their influence upon the physical parts. For it is now known that, however carefully, correctly and thoroughly the machinery of voice is used, there is a voice better and more beautiful than such machinery can, by itself, produce. The development of vocal method, thus very briefly outlined, is engaging the serious attention of the best American teachers who make teaching a profession, and there is evidence that such study is making a new vocal method.

FRANK H. TUBBS,
Editor 'Music Life.'

Voice, Special Features of Organs of, in Man. The vocal organs of man and apes are similar, basically, in structure; but in man all that enters into the perfecting of the speaking voice has been vastly improved. In the first place man has fortunately discarded or rendered vestigial the voice-pouches occurring in certain man-like apes, permitting these animals to produce demoniacal sounds which make night hideous. Whatever vestiges of these appear in man are found connected with the larynx, behind the Adam's apple. The complete command over the product of voice man secured when the alveolar arch and palatine area became shortened and widened; and when the tongue, by accommodation to the modified mouth became shorter and more horizontally flattened. The control of the tongue, again, was accomplished by his

VOICE, SPECIAL FEATURES OF ORGANS OF

gaining possession, on the inner centre of the ordinary human jaw, at the central curve or symphysis forming the chin, of a small bony tubercle, known as the genial tubercle, the movements of the tongue, as an organ of speech, being effected mainly by the action of the muscle inserted into this tubercle, absent in some primitive "human" jaw bones; and entirely absent in the man-like apes.

It was the rise of man in the world and the gaining of complete equilibrium in his erect attitude, that, however, was one of the chief means of readjustment as it was one of the specific evidences of human advance. It gave man a wider horizon, opened up his dormant imagination; raised his chin and his chest. The chest was freed from the pressure of the bowels, giving freedom to the development of the lungs, as the source of supply and control of the breath. The man who stood best before his fellows was the man whose voice carried further. This was accomplished by the greater resonanting power of men who "possessed nose." Blaise Pascal (1662) had already noted a concrete example: "If the nose of Cleopatra had been shorter the whole face of the earth would have been different." This is a fact that science is only now explaining. The Romans, large nosed, were leaders and conquerors. They were strong men; and strong men had strong passions; the orientals call an angry man a "man of nose." Command and passion speak in short tones; and "syllables govern the world." In giving command a short word is always used: Opiian advised the giving of short names to dogs from this very fact.

But the force impelling speech is, at last, psychical. Hence the necessity of the study of the brain in connection with speech. The faculty of language has been found to have close relations with one of the frontal convolutions, which is anatomically most perfect in man, in anthropoids rudimentary, and in the inferior monkeys entirely absent. The location of the zone of speech is in one hemisphere only, according as the individual is right- or left-handed. Its location is the opposite to the side of the hand preferred: in most, or right-handed, persons, it is on the left, and *vice versa*. "Right-handedness and speech are controlled by the same hemisphere of the brain and from contiguous areas; so that if right-handedness was first used for expression before speech that speech has arisen from the setting aside for further development of the area in the brain first used for right-handedness. The indication of the close association of right-handedness and speech in the same location of the brain, might suggest that they developed together. That is, that as soon as man began to use his arms for the possession of the necessary food for hunting, he might have contemporaneously or simultaneously gained some progress in utterance" (Baldwin).

The nourishment of the psychical basis, the brain, is therefore essential. It is the supply of blood to the brain that controls our emotions: bounding freely through the arteries of the brain it effects our consciousness as an emotion of the exalting class. Rapid thought, hurried speech, vigorous gesture, are results of strong body excitement caused by dilation and increased blood flow, controlled by the sympathetic nervous system. On the other hand with contraction of the arteries, that is, lessened

blood flow, we have sluggish thought, languid movement, and uncertain speech. Meinert has calculated that the brain may contain six hundred million cells, each of which contains an incalculable number of atoms. Hence the importance of nourishment, which means growth. Here the experiments of Elmer Gates of Washington, may be referred to, as he demonstrates the necessity not only of proper brain nourishment through the blood, but of their nourishment, in proper environmental associations. Speech, appealing to the sense of hearing, the capacity of audition, on the part of the listener, as well as that of the speaker (it being found that the speaker hears his own voice differently from the listener) is a feature that is undergoing careful study.

The child's speech apparatus is of much smaller dimensions than in adult man. The resonance chamber is smaller, and more energetic adjustments have to be made whenever definite resonance is required, by changing the angle of the jaw, the position of the tongue, or the conformation of the lips. The lungs have not sufficient depth; the pectoral muscles are but slightly developed, the breathing is accomplished much more through the diaphragm than through the active expansion of the pectoral cavity, hence breathing movements are more superficial and irregular than in later years. Speech requires complete control of the breathing mechanism, which the child has not yet got, while he still wants in his organ a large number of "strings, whistles and registers," the larynx being still small and undeveloped; and so with the tongue, the lips and the muscles moving them; while the teeth are still entirely wanting. The undeveloped condition of the auditory apparatus and the brain have also to be taken into account.

Lastly, in regard to the highest development of the human voice in song, the action of the three hollow spaces, nasal, oral and laryngeal, has much to do with the modification and modulation of the singer's voice. These spaces are to the vocal bands what the violin is to the strings; and, for every tone and vowel the mucous membrane of the spaces named must be drawn into a special position (including the position of the larynx) before the air in the spaces can be brought into vibration by the action of the vocal bands. But the vibration of the cords alone is never the tone. The surfaces of the mucous membranes are drawn into different shapes, particularly fit to produce tone-waves or to disturb them, and to produce in such tone-waves, not only fundamental tones, but over-tones. The tongue is a large and direct agent in formation, in the middle or oral space, as it is connected with the upper part of the larynx; its derangement in action being alone sufficient to utterly destroy tone, or, on the contrary, when well adjusted and hanging normally in relation to the other voice parts, to give what is termed the silvery quality to the voice. These spaces are as important in producing the modification and modulations of the singing voice as are the vocal cords and intrinsic muscles of the larynx; there being no doubt, however, that the movements of the larynx depend upon and are controlled by the muscles and movements outside that organ. The control of the motive power, the breath, is of the utmost importance in maintaining the

VOICING—VOLATILE OILS

fixation and cord stretching of the vocal mechanism.

From the above it will be seen that speech is a product of mechanism finely adjusted and controlled by forces of the highest mental development, making man what he is. See **SPEECH, ORIGIN AND NATURAL HISTORY OF.**

ROBERT C. AULD, F.Z.S.

Voicing. See REED, FLUE, AND STRINGED INSTRUMENTS, CARE OF.

Voit, foit, Karl von, German physiologist: b. Amberg, Bavaria, 31 Oct. 1831. He was educated at Munich, Würzburg, and at Göttingen, and in 1863 became professor of physiology at the University of Munich. He was early engaged in scientific researches, his first achievement of importance occurring in 1854, when he proved the presence of urea in the muscular tissues of cholera patients. He subsequently made a specialty of questions of digestion and assimilation. His works are numerous, and among them are included: 'Physiologisch-chemische Untersuchungen' (1857); 'Ueber die Kost in öffentlichen Anstalten' (1876); 'Untersuchung der Kost in einigen öffentlichen Anstalten' (1877).

Vokes, vōks, (Theodosia) Rosina, English actress: b. 1858; d. Torquay, Devonshire, 27 Jan. 1894. She first appeared at the Alhambra Palace, London, in the 'Belles of the Kitchen.' In 1885-93 she toured North America. She took leading parts in 'The Parvenu,' 'The Schoolmistress,' 'The Milliner's Bill,' 'The Circus Rider,' 'Maid Marian,' and 'A Pantomime Rehearsal.' She was married to Cecil Clay in 1880, and for a time retired from the stage.

Volapük, vō-lä-pük', a proposed universal language invented about 1879 by Johann Martin Schleyer, of Constance, Germany. The name means "world-speech," being based on English *world* and *speak*, and a number of the vocables are modified English words, the total number in the language being about 14,000, some 1,300 being root-words. In structure the language is simple and extremely regular, and the orthography is entirely phonetic, the words being pronounced as they are written, and *vice versa*. The study of Volapük, after having made some progress, has latterly declined; but there are still periodicals written in it, and associations devoted to its dissemination. Various other attempts to provide a universal language, especially one suited for commercial purposes, have been made in recent times. See ETYMOLOGY; PHILOLOGY; SCIENCE OF LANGUAGE.

Volatile Oils, or Essential Oils, vegetable oils distinguished by the possession of pungent, characteristic odors, and by the fact that they can be vaporized without decomposition, and usually without any considerable residue. The volatile oils differ from the "fatty oils," or "fixed oils" (of which olive oil is an example), from a chemical point of view, in consisting mainly of hydrocarbons, and in containing little or no true fat.

The known volatile oils are very numerous,

and are obtained from plants, or parts of plants, or from vegetable exudations, mainly by the action of heat or pressure, or by the solvent action of fats. In some cases, as in the extraction of the essential oil in orange peel, a portion of the oil may be obtained by placing the material containing it in horse-hair bags, and subjecting it to pressure. Distillation is also commonly employed, the plants or parts of plants containing the oil being placed in a still with water, the contents of the still being constantly stirred, and heated by means of a steam-jacket. The boiling points of the volatile oils are mostly higher than that of water, but as they possess a considerable vapor tension at the boiling point of water, they distil over at that temperature in sufficient quantity to make the process commercially practicable. In some cases, it is found to be advantageous to raise the boiling point of the water in the still somewhat, by the addition of salt. When the oil that is to be prepared is injured by exposure to the temperature of boiling water, it is customary to extract the oil by macerating the plant with grease. In the preparation of perfumes, for example, it is common to treat the flowers containing the oil with pure lard or paraffin, which is kept fluid by a water-bath. The fat extracts the volatile oil, and when the charged fat is afterward shaken up with alcohol it gives up the oil, in large measure, to the alcohol. The process known as "enfleurage" is essentially the same as the one just indicated, except that it is not conducted by the aid of heat, the grease being allowed to remain in contact with the flowers for a longer time, at a lower temperature; the oil then being recovered from the fat by means of alcohol, as before.

The following are the more familiar of the essential or volatile oils:

Oil of Bitter Almonds.—Prepared by distilling the pulp that is left after the fixed oil contained in the almonds has been expressed by pressure. It consists mainly of benzaldehyde, C_6H_5CHO , and boils at $179^\circ C$.

Oil of Bergamot.—Prepared from the unripe fruit of *Citrus Bergamia*, by squeezing the rind by hand and wiping the expressed oil off with a sponge, the sponge being squeezed at intervals into a collecting vessel. It contains a considerable quantity of the hydrocarbon citrene, $C_{30}H_{48}$, together with other compounds whose precise nature has not yet been thoroughly investigated. The oil is extensively used in perfumery.

Oil of Cloves.—Obtained by distilling the flower buds of *Caryophyllus aromaticus*. It consists of a mixture of sesquiterpene and eugenol and is heavier than water.

Oil of Eucalyptus.—Prepared by distilling the leaves of the eucalyptus tree. It is pale yellow in color, and is used in medicine and in perfumery. Its chief constituent is cineol, $C_{10}H_{18}O$.

Oil of Lavender.—Prepared by the distillation of lavender flowers, the best quality being made from *Lavandula vera*. Oil of spike is an inferior variety, prepared from *Lavandula Spica*. Oil of lavender is used in perfumery, and oil of spike is extensively employed in porcelain painting.

Oil of Lemon.—Prepared from scarcely ripe lemon rinds by the sponge method, described above under "Oil of Bergamot." An inferior variety is also prepared by distilling the residues

VOLCANIC ROCKS—VOLCANO

remaining from this process. Oil of lemon consists chiefly of limonene, $C_{10}H_{16}$, a hydrocarbon which resembles the citrene of oil of bergamot, but which differs from it in certain particulars. Oil of lemon is used in confectionery and perfumery.

Oil of Origanum, Oil of Thyme, or Marjoram Oil.—Obtained by distillation from certain species of marjoram.

Oil of Peppermint.—Prepared by distilling the herb *Mentha piperita*. It consists chiefly of a solution of menthol in various terpenes, and is used in medicine and as a flavoring, especially in confectionery.

Attar (or Otto) of Roses.—Prepared by the distillation of certain species of roses, and especially from *Rosa Damascena*, which is cultivated in Turkey. It is used extensively in perfumery, and, on account of its high commercial value, is often (and perhaps always) adulterated. The most common adulterant is "geranium oil," which is manufactured expressly for adulterating attar of roses, by distilling a species of grass that grows in India.

Oil of Turpentine.—Prepared by distilling the resinous exudations from certain species of pine trees. American oil of turpentine is prepared chiefly from *Pinus australis*, and consists mainly of dextro-pinene, a hydrocarbon having the formula $C_{10}H_{16}$, and boiling at $156^{\circ}C$.

Volcanic Rocks. Those igneous or pyrogenic rocks which have reached the surface through volcanic necks or through fissure eruptions. Volcanic rocks were formed in all ages of the earth's history, but were generally more or less restricted geographically. Contrasted with them are the rocks which cooled beneath the surface to which the name plutonic is generally applied. Extrusive (effusive) and intrusive are other terms used for these rocks. At best this distinction is only one of convenience, and has no great scientific value. Among the more important rocks of this type may be mentioned, obsidian, pumice, rhyolite, trachyte, felsite, andesite, and basalt (qq.v.).

Volcano (Ital. *volcano*; from Lat. *Fulcanus*, the god of fire; originally the volcano of Etna, the fabled abode of the god), an opening in the crust of the earth from which proceeds heated gases (hydrochloric, sulphurous, etc.) sometimes in flames, volumes of steam, eruptions of ashes mixed with scorïæ and large stones which are often red-hot, and of molten rock, called lava. The phenomenon is chiefly limited to certain regions in different parts of the earth, known as volcanic districts; and in these districts established and permanent vents may continue constantly sending forth smoke and flame, like Stromboli on one of the Lipari Islands in the Mediterranean; or eruptions of more severe character may take place at irregular intervals. The matter thrown out from volcanoes generally accumulates around the openings or craters till they build up a hill, or even a mountain several thousand feet high; but the vent may continue for a long time at a low level, and is even formed beneath the sea, sometimes without rising above the surface. Instances have occurred of a volcanic eruption suddenly forming an island in the midst of the sea. Other volcanoes that have been suddenly raised up

have remained permanently in the form of mountains. Such is the volcano of Jorullo (q.v) in Mexico. The greatest volcanic mountains, as Etna, Hecla, and Vesuvius, are produced by accumulations of volcanic matters, as beds of lava, ashes, and scorïæ, sometimes alternating with beds deposited beneath the sea charged with the vestiges of marine animals, the collection of which must have occupied long periods of time. This is especially apparent in the case of Etna. Volcanoes sometimes remain inactive so long as to lose their peculiar character; but they may at any time break forth again. Vesuvius was not known to the ancients as a volcano, though it was apparent from the form of the mountain and the materials of which it was composed, that such must have been its character at some former period. Volcanoes which show outbursts of more or less frequency are called *active*. Those known to have been active in historic times, but long quiescent, are called *dormant*. Ancient volcanic mountains are met with in Hungary, in central France, and other places, of whose eruptions no record exists. Such are termed *extinct* volcanoes, but they may at any time become active. Probably the most general understanding of a volcano is of a conical hill or mountain. There is, however, no limitation as to height, some comparatively low volcanoes, such as Pelée and Soufrière, manifesting violent and disastrous eruptions, while, on the other hand, such lofty peaks as Kilimanjaro, Cotopaxi, and Popocatepetl are of a volcanic character.

As generally considered, a volcano is divided into three fundamental parts—the base, or elevation proper; the cone, rising steeply from the base; and the crater, the depression occurring at the summit of the cone. These parts are not invariably present in distinct form in all volcanoes; in many, eruption takes place without any crater. Nor do eruptions always proceed from the crater, when present; the crater being located at the summit of the cone, while activity is in many cases exhibited independent of the crater by supplementary craters in additional cones, broken out on the slopes of the mountain. Craters of course vary greatly in size and sustain no proportional relation to the mountain or elevation. Haleakla (island of Maui, Hawaii), 10,000 feet, has a crater of 20 miles' circumference; but the crater of Orizaba (Mexico, on the boundary between the states of Vera Cruz and Puebla), $3\frac{1}{2}$ miles, has a crater with a diameter of less than 1,000 feet.

The causes of volcanic action are still much obscured, though various explanatory theories have been advanced. In early times, the rising cloud of dust attending an eruption, lit by the glow of the lava, came readily to be regarded as mingled smoke and flame, and blacksmith-gods were thought to have their forges in the subterranean regions. The view now generally accepted is that internal heat, which increases toward the earth's centre, causes the evolution of a great body of elastic vapor, which, expanding and seeking an outlet where there is the least resistance, manifests itself in the upheavals and explosions of an eruption. The body of vapor is thought to be derived from the superficial mass of the earth, become hydrated, or combined with water. Such action, as well as the presence of the molten rock known as lava, is accounted for by vast internal displacements,

bringing the inner crust, with its high temperature, nearer to the surface. Volcanoes are, in general, to be found in areas where the earth's crust is of an inferior strength. These areas are naturally ocean-basins, the territory bordering on such basins, or the ranges of mountains marking or flanking the outlines of the continents. With the possible exception of Wrangel (Alaska) no active volcano exists far inland save in a district which is either the scene of a comparatively recent displacement or is marked by an instability in the earth's crust. One of the chief lines of distribution surrounds the Pacific Ocean, running along the western coast of South, Central, and North America; the Aleutian Islands, Kamchatka, and the Kurile group; Japan, Formosa, the Philippines, the Moluccas, the North Hebrides, New Zealand, and South Victoria Land. Included within this line are numerous other volcanoes, such as Kilauea, Mauna Loa, and Mauna Kea (Hawaii), and those of the Polynesian Islands. In the Atlantic section are the Antilles, the Canaries, the Azores, the Cape Verdes, Iceland, Madeira, etc. The European line follows the Mediterranean, and is continued into eastern Asia, about the Caspian. It includes the Lipari Islands, the Aegean Islands, Etna, Vesuvius, Ararat, and Demavend. J. W. Judd ('Volcanoes' 1881) estimated that there are from 300 to 350 vents of customary activity. There are perhaps about an equal number whose latest activity was at a date comparatively recent.

The phenomena of volcanic activity are numerous and varied. A great portion of the material upheaved in an eruption is lava. The kinds of rock composing this are largely silica and silicates, those containing a relatively small percentage of silica being called basic, and those containing considerable silica, acid. The acid variety of lava is the lighter; sometimes it does not move from the lava vent, and when it does it generally proceeds a short distance only, solidifying in a thick mass. The basic is much more liquid, and covers the slopes of the mountain or forms a lake on the adjacent plains. When lava is imperfectly fused and large quantities of steam are present, the lava becomes, as it approaches nearer the surface, filled with bubbles, which continue to expand, lightening the lava and facilitating its upward movement. At the surface, the lava is torn apart by the steam, the fragments being hurled high in the air. These fragments are known as cinders, or, when finer, ashes. There are also numerous accessory phenomena, such as earthquakes (see EARTHQUAKE); electric and magnetic disturbances; and various acoustic manifestations. The explanations of these phenomena have not yet been satisfactorily reached. One of the most remarkable examples was the disturbance of the magnetic field throughout the world which accompanied the Pelée eruption of 8 May 1902. Contrary currents of air also occur, some advancing before the clouds of the eruption, others moving toward the volcano, apparently into vacua caused by the abrupt explosion of steam. The geysers of Yellowstone Park, the solfataras (vents from which proceed sulphurous fumes) of Italy, etc., are signs of a decreasing volcanic activity in the areas where they occur. Consult: Darwin, 'Volcanic Islands' ('Voyage of the Beagle' 1839); Lyell, 'Principles of Geology,' Vol. I. (1872); Green, 'Vestiges of a Molten

Globe' (1874); Dana, 'Characteristics of Volcanoes' (1890); Judd, 'Volcanoes' (1881); Scrope, 'Volcanoes' (1872); Mallet, 'Volcanic Energy' ('Philosophical Transactions' of the Royal Society 1873); Russell, 'Volcanoes of North America' (1897); and Heilprin, 'Mont Pelée and the Tragedy of Martinique' (1903). See also articles on individual volcanoes.

Vole, an assemblage of rodent mammalia, belonging to the muridae, or rats and mice, and distinguished by the enamel of the rootless molar teeth being folded in the form of a double series of alternating triangles. The ears are very short and rounded, and the soles of the feet are hairless and tuberculate, while the tail is relatively short. The body is stout and heavy, the legs short and the movements clumsy. The voles and their immediate allies form a sub-family (*Microtina*) of the *Muridae*, known in this country as meadow-mice or field-mice (q.v.). Consult Miller, N. A. Fauna No. 12, U. S. Dept. of Agriculture; Bailey, Id. No. 17; and Stone and Cram, 'American Animals,' New York, 1902.

Volga, vól'gá, a river in Russia, the longest in Europe. It rises among marshes and small lakes beside the Valdai Hills, in the government of Tver, at an elevation of about 550 feet above sea-level, and falls into the Caspian Sea by many mouths, at Astrakhan. Its basin has an area of about 563,300 square miles, and its entire course, including windings, is about 2,200 miles in length, while its fall from source to embouchure is only 630 feet. It flows at first southeast about 90 miles to Zubtsov, thence generally northeast past Tver to Mologa, thence east by south past Yaroslavl, Kostroma and Nijni-Novgorod, to the vicinity of Kasan. Here it turns south, flows circuitously south-southwest, past Simbirsk and Saratov to Tsaritsyn and Sarepta, making a marked eastward bend at Samara, and thence southeast to the Caspian. At Tsaritsyn it sends off a branch, the Akhtuba, which flows parallel to the main part of the river, and is connected with it by many cross branches. Its principal affluents are the Oka and Kama, the one joining it from the southwest, the other from the northeast. The Volga is navigable almost from its source, and below Nijni-Novgorod it floats quite large vessels; but its navigation is impeded by shallows and sand-banks, and in winter by ice. Passenger steamers similar to those of American rivers ply upon it. By a judicious system of canals it communicates with the Caspian, Baltic, Black, and White Seas. The short railway from Tsaritsyn to the river Don has diverted much of the traffic from the lower Volga and the Caspian to the lower Don and the Sea of Azov. The banks of the Volga are fertile, and often well-timbered. The river abounds in fish, particularly sturgeon, carp, and pike of extraordinary size.

Volhynia, vól'hín'i-á, Russia, a southwest government, bounded north by Grodno and Minsk, east by Kiev, south by Podolia, and west by Austrian Galicia and Poland; area, 27,743 square miles. The capital is Zhitomir. In the south there are spurs of the Carpathians, but the north is low and largely marshy. The whole drainage is carried to the Dnieper by numerous small streams. The climate is mild, equable, and in general healthy. The soil is almost all remarkably fertile, producing abundant crops of all kinds of grain, particularly wheat of excellent quality. Beets and tobacco are important

crops. There are also considerable manufactures. Pop. (1897) 2,997,902.

Volition. See WILL.

Volkman, fōlk'mān, Alfred Wilhelm, German physiologist: b. Leipsic, Germany, 1 June 1801; d. Halle, Germany, 21 April 1877. He was educated in Leipsic, London, and Paris, was appointed professor of physiology at Dorpat in 1837 and in 1843 accepted the chair of physiology and anatomy at the University of Halle. He made a specialty of the study of the nervous and optic systems. His writings include: 'Anatomy of Animals' (1831-3); 'The Independence of the Sympathetic System of Nerves' (1842); 'Elasticity of Muscles' (1856); 'Physiological Researches in the Department of Optics' (1863-4); etc.

Volkman, Richard von ("RICHARD LEANDER"), German surgeon and author, son of Alfred Wilhelm Volkman (q.v.): b. Leipsic, Germany, 17 Aug. 1830; d. Jena, Germany, 28 Nov. 1889. He was educated at Halle, Giessen, and Berlin, in 1857-67 was private-docent of surgery at Halle, becoming professor of surgery and chief of the hospital at that university in 1867. He was a surgeon in the army during the wars of 1866 and 1870-1, becoming surgeon-general in the latter war. He was eminent as a lecturer, made many important investigations in surgery and pathology, and was among the pioneers in introducing the surgical methods of Lister into Germany. He wrote: 'Traumereien au französischen Kaminen Märchen' (1871; 24th ed. 1894); 'Aus der Burschezeit' (1876); 'Gedichte' (1877); while among his professional writings are: 'Beiträge zur Chirurgie' (1875); 'Be merkungen über einige vom Krebs zu trennende Geschwülste' (1858); etc.

Vollon, vō-lōn, Antoine, French painter: b. Lyons 20 April 1833. He studied at Lyons and Paris, and exhibited for the first time at the Salon in 1864. At the following year's exhibition he received a medal, also at the salons of 1868 and 1869. He is remarkable for his technique and although he paints figures and landscapes is pre-eminent in the delineation of still-life—a long neglected branch of art. Among his pictures of this kind are: 'Armor'; 'Curiosities'; 'Sea Fish'; and 'The Pumpkin,' this last being in the collection of William Schaus, New York.

Volney, vōl'nī (Fr. vōl-nā), **Constantin François de Chassebœuf, COMTE DE**, French author: b. Craon, Anjou, 3 Feb. 1757; d. Paris 25 April 1820. He traveled in Egypt and Syria, and urged upon France the conquest of the former in his 'Considérations sur la Guerre Actuelle des Turcs avec les Russes' (1788). Elected to the National Assembly in 1789, he was imprisoned for opposition to the Terror, and on his release made a tour of the United States, described in 'Tableau du Climat et du Sol des Etats-Unis d'Amérique' (1803). After his return he became senator. His best known work is 'Le Ruines ou Méditations sur les Révolutions des Empires' (1791), a vision of a historico-philosophic sort, in which, near the ruins of Palmyra, representatives of all civilizations and faiths pass by and are reviewed. Consult Berger, 'Etudes sur Volney' (1832); Barni, 'Les Moralistes Français' (1873).

Vologda, vō-lōg-da, Russia, (1) a town, capital of the government of the same name, on the Vologda, in the southwest of the government, in a beautiful district extensively occupied with gardens, 35 miles east-southeast of Saint Petersburg. It consists chiefly of old wooden houses; with a few stone buildings in the modern style in the chief square, and has manufactures of linen, soap, candles, glass, leather, etc. Pop. (1897) 27,855. (2) The government of Vologda in the northeast of Russia, is bounded north by the government of Archangel; east by the Ural Mountains; south by Perm, Viatka, Kostroma, and Yaroslaf; and west by Novgorod and Olonetz; area, 155,498 square miles. The surface consists generally of a plateau covered with woods, lakes, and morasses. The drainage mostly belongs to the basin of the Northern Ocean. The great wealth of the government consists in its forests, which furnish timber and charcoal. Pop. (1897) 1,365,587.

Volsci, vōl'sē, an ancient Italian tribe dwelling in Latium, on both sides of the river Liris (Garigliano). They had a republican government. Their principal city was Corioli, from which Coriolanus derived his surname. After having several times endangered the Roman state, they were conquered and absorbed in the Romans, and thus disappeared from history as a distinct people, like the other tribes of Latium (338 B.C.).

Volsk, vōlsk, or **Voljsk**, Russia, a town in the province of Saratov; on the Volga; 80 miles northeast of Saratov. It has a technical school, normal school, etc., ironworks, and tanneries. Large quays extend along the river, and trade in tallow and skins with Saint Petersburg, in fruit with Nijni Novgorod, and in corn with Astrakhan and Rybinsk, is carried on. A great market is held in autumn. Pop. (1890) 39,995.

Volsungs, vōl'soongs, a heroic race celebrated in old German legend. Volsung or Walsung, the grandson of Odin, stands forth as the original ancestor. The most interesting and romantic figure in this line of heroes is Volsung's son, Siegmund. Sigfried or Sigurd, hero of the 'Nibelungenlied,' is of the same race. The old Icelandic Volsungasaga, which has been followed by William Morris in his 'Story of Sigurd the Volsung' contains the original legend.

Volt. See ELECTRICITY; VOLTA, ALESSANDRO.

Volta, vōl'tā, Alessandro, Italian physicist: b. Como 18 Feb. 1745; d. there 5 March 1827. In 1777 he paid a visit to Switzerland, where he became personally acquainted with Haller at Bern, Voltaire at Ferney, and De Saussure at Geneva. Two treatises, published in 1769 and 1771, in which he gave a description of a new electrical machine, laid the foundation of his fame. In 1774 Volta became rector of the gymnasium in Como and professor of physics. In 1779 he was transferred from Como to Pavia to fill the chair of natural philosophy in the university of that city. Here he occupied himself entirely with electrical researches. He had previously (1777) invented the electrophorus (q.v.), and his invention of the electroscope (q.v.) (also 1777), was an important improvement. His observations upon the bubbles which arise from stagnant water led him also to some valuable discoveries in regard to gases. The electrical pistol, the eudiometer, the lamp with

inflammable air, the electrical condenser, and other inventions, are among his claims to renown. He next turned his attention to some of the atmospherical phenomena, such as the nature of hail, and subsequently increased his reputation by the invention of the Voltaic pile (1800). In 1782 he had made, a tour through France, Germany, England, and Holland. In 1794 he received the Copleian medal from the Royal Society of London, for his paper upon the condenser; and in 1801 his electric apparatus attracted so much notice in France that Napoleon invited him to give an account of his invention before a commission of the Institute, and when the commissioners made their report, proposed that a gold medal should be awarded the inventor in recognition of his services to science. He was also decorated with the cross of the Legion of Honor and the order of the Iron Crown, and was raised to the dignity of senator of Italy, with the title of count. In 1804 he resigned his professorial duties. Antinori edited a collection of his works (1816). Consult Mocchetti, 'Vita del Conte Volta' (1838).

Volta, West Africa, a river of Upper Guinea, which, rising in the Kong Mountains or highlands behind the Ashanti country, runs south between Ashanti and Dahomey, and reaches the Bight of Benin through the east part of the British Gold Coast at Adda. To left and right of its mouth it forms great lagoons, and on the bar across the mouth a heavy surf runs. With its chief tributary the Black Volta its total length is about 850 miles, 250 of which are navigable in the flood season.

Voltaic Batteries. See PRIMARY BATTERIES.

Voltaic Cell. See PRIMARY BATTERIES.

Voltaic Pile, in electricity, an arrangement in a pile of alternate disks of copper and zinc separated by pieces of flannel moistened with salt water or with water acidulated with sulphuric acid. The voltaic pile gives a very small current; but, its circuit being broken, it shows at its extremities electricity of high tension, and it is capable of sending a current through considerable resistances.

Voltaire, vól-târ, **Jean François Marie Arouet**, French man of letters: b. Paris 21 Nov. 1694; d. there 30 May 1778. He was destined for the legal profession, but his inclination for literature was so decided that he never seriously entered upon it, and the success of his first tragedy 'Œdipe,' brought out in 1718, decided him. It is traditionally recorded that this play was finished, and that two cantos of his 'Henriade' were written in the Bastille, where he was confined (May 1717, to April 1718), on account of certain satirical verses on the regent, the authorship of which was ascribed to him. The success of his tragedy at once made him the fashionable poet of the day, and for the next eight years he resided mainly at Paris. It was about the beginning of this period that he changed his paternal name of Arouet into Voltaire, which latter name is most probably explained as an anagram of Arouet l. j. (le jeune — the younger, he having an elder brother). Voltaire suffered a second imprisonment in the Bastille in 1726, the occasion of which was his sending a challenge to the Chevalier Rohan, by whom he had been insulted. This imprisonment lasted but a month, and on being liberated

Voltaire determined to seek greater liberty in England, whither he had been invited by Lord Bolingbroke. His residence in England lasted till 1729, and during it he acquired a certain knowledge of English literature (Shakespeare, Pope, Swift, Addison), and made himself acquainted with the writings of the English free-thinkers, Toland, Tindal, Collins, Shaftesbury, and others. After his return he lived chiefly at Paris till 1734. In the course of this second Parisian residence he raised himself from very moderate circumstances to a condition of affluence, not, however, by literary labor, but by monetary enterprises in connection with a government lottery, the corn-trade, and army contracts. From 1734 to 1749 his principal place of residence was at Cirey, in Lorraine, where he lived with the Marchioness du Châtelet, with whom he had become intimate in July 1733. The death of the marchioness in 1749 deprived him of this retreat, and in the following year he accepted the often repeated invitation of Frederick the Great to come and live at his court at Potsdam. Here he was received with the greatest honor, but the good understanding between him and the king did not last long, and in 1753, after numerous unpleasant scenes, Voltaire quitted the Prussian court. Before returning to France he visited one or two of the minor courts of Germany. At Frankfort Frederick caused him to be detained in order to recover from him a collection of poems by the king containing a number of satires on several princes, some of which Voltaire had maliciously exhibited at the courts he had visited. Early in 1755 he removed to Geneva, and for the remainder of his life lived mainly either in Switzerland or close to its borders. About 1758 he fixed his residence with his niece, Madame Denis at Ferney, in the Pays de Gex, a district that at one time belonged to the counts of Geneva, and from this time this was his sole place of abode. Under his care the village of Ferney, which in 1758, when the estate in which it lies was acquired by him, contained only 49 peasants in a miserably poor condition, became a thriving place, and in 1778 numbered 1,200 inhabitants, among whom Voltaire lived almost as a sovereign prince. In this retirement he became known to all Europe as the patriarch of Ferney, and received a constant succession of visits from persons of rank and fame, and kept up an immense correspondence, which included in its range most of the crowned heads of Europe. In February 1778, impelled, no doubt, chiefly by the desire of hearing once more the applause of multitudes, he went up to Paris, where he was hailed by all classes with boundless enthusiasm. But the sudden change in his manner of life had an injurious effect upon his health, and there can be little doubt that his death was hastened by the excitement of the occasion. He was buried at the Abbey of Scellières, between Nogent and Troyes, of which his nephew, the Abbé Mignot, was commendator. At the revolution his remains were transferred to the Panthéon (1791).

During his whole life Voltaire was an indefatigable writer. The long list of his productions embraces works in almost every branch of literature: in poetry, the drama, romance, history, philosophy, criticism, and even science. Nearly all his works are strongly animated by a spirit of hostility to the Christian religion and its

VOLTAISM—VOLTERRA

representatives. This brought him into conflict with the religious element and the government, and a great part of his later years was spent in exile on account of his extreme and rabid criticism of religious thought and belief. It was mainly in order to be out of reach of the government that he lived so much at a distance from Paris on the frontiers of France, whence he could easily make his escape for a while, when he thought it advisable, into Holland or Switzerland. At Cirey and Ferney he could be more outspoken than he had dared to be when he lived chiefly at Paris. From Ferney he issued all his most direct attacks upon Christianity and Catholicism, the 'Sermon des Cinquante,' 'Extrait des Sentiments de Jean Meslier,' 'La Bible enfin Expliquée.' At the same time he was a chief contributor to the 'Encyclopédie,' and indeed its leading spirit. Yet he had no sympathy with the atheistical views that are found expressed in some parts of that work. He upheld theism with as much zeal as he denounced Christianity and priesthood, and even came to be looked upon as reactionary by the atheistical spirit of the time. It ought to be mentioned also that his hatred of fanaticism, although often the cause of violence and injustice on his part, was the mainspring of some of the most honorable actions of his life, as in the case of the Calas family. (See CALAS, JEAN.)

The works of Voltaire on which his literary fame is now generally held mainly to rest, are his philosophical novels such as 'Zadig,' 'Candide,' 'L'Ingénu'; his histories ('Siècle de Louis XIV.,' 'Histoire de Charles XII.'), his correspondence, and more than all, perhaps, his poetical epistles, satires, and occasional poems of a light character, in which the typical Frenchman is exhibited in his most complete manifestation, full of wit, gaiety, vivacity, ease, and grace. Several of his tragedies, among which may be mentioned 'Zaïre' (usually reckoned his masterpiece in the dramatic art), 'Alzire,' 'Mérope,' 'Mahomet' (translated into German by Goethe), and 'Rome Sauvée,' had great success in their own day, but the French do not assign to them a high place in their literature. Voltaire attempted comedy also, but in this he was still less successful. He seems to have been almost entirely deficient in the comic faculty. The best of his comedies is 'L'Enfant Prodigue.' We should not omit to mention that Voltaire was always a great lover of the drama, and that wherever he settled for any length of time one of his first aims was to get a theatre established in the place, sometimes in his own house. Occasionally he acted himself. The 'Henriade,' an epic poem, with Henry IV. of France, as hero, is another work of his, which, though not highly esteemed now, had great success, and exercised a powerful influence when it first appeared. Of the numerous editions of the works of Voltaire, the best are those of Beaumarchais, with introductions and notes by Condorcet (1784-90), Beuchot (1828 et seq.), and Moland (1877-85). The chief biographies are those by Desnoiresterres, 'Voltaire et la Société Française au XVIII. Siècle' (2d ed. 1887); Mahrenholtz, 'Voltaires Leben und Werke' (1885); Parton, 'Life of Voltaire' (1881); Hamley, 'Voltaire' (1877); Ballantyne, 'Voltaire's Visit to England' (1893); and Espinasse, 'Voltaire' (1892). Consult also D. Strauss

'Voltaire: Sechs Vorträge' (1870); John Morley, 'Voltaire' (1872); Maugras, 'Voltaire et Jean Jacques Rousseau' (1886); Rabaud, 'Études Historiques sur l'Avènement de la Tolérance' (1892); Campardon, 'Documents Inédits sur Voltaire' (1893); Deschanel, 'Le Théâtre de Voltaire' (1886); Lion, 'Les Tragedies et les Théories Dramatiques de Voltaire' (1896); Lounsbury, 'Shakespeare and Voltaire' (1902); Calmettes, 'Choiseul et Voltaire' (1902).

Vol'taism, in physics, a term applied to galvanism, from the fact that Volta's explanations of Galvani's experiments on frogs led to the correct appreciation of the sources of the electricity so generated.

Vol'tam'eter, in electricity, an arrangement which shows the quantity of electric current which is passing through its circuit in terms of a quantity of water decomposed. The figure shows the voltameter to the left connected with a battery. A circular vessel has two wires let through its bottom, which bear inside two pieces of platinum foil as shown; water slightly acidulated with sulphuric acid is poured into the vessel, and two tubes which have been filled with

Voltameter.

water are placed one over each strip of platinum or electrode. On the poles of the battery being connected with the exterior ends of the wires by means of binding-screws, water will be decomposed, and hydrogen will appear in one tube and oxygen in the other. It will be found, as represented in the figure, that more than twice the quantity of water is displaced in the hydrogen tube than in the oxygen tube. Two volumes exactly of hydrogen and one volume of oxygen are the proper proportions to form water; but some of the liberated oxygen is dissolved by the water.

Volterra, vŏl-tĕr'ra, **Daniele da** (RICCIARELLI, DANIELE) Italian painter: b. Volterra, Italy, 1509; d. Rome 4 April 1566. He studied painting at Siena, and afterward went to Rome, where he gained the friendship of Michelangelo, who not only instructed him, but gave him designs for some of his works. His fame rests chiefly on a series of frescoes in the Church of La Trinità de' Monti, Rome; and of these the 'Descent from the Cross' is well known by Toschi's engraving. He was employed by Paul IV. to drape the figures in Michelangelo's 'Last Judgment' and thus earned for himself the

VOLTURNO — VOLUNTARYISM

soubriquet of "Il Braghettone" (The Breeches-maker). In the latter part of his life he applied himself also to sculpture.

Volturno, vól-toor'nō, Italy, a river which rises in the province of Campobasso, flows southeast to its junction with the Calore, and then west past Capua into the Mediterranean, 20 miles southeast of Gaeta, after a course of 112 miles. Garibaldi won a victory over the army of the king of Naples on its banks in 1860.

Volume, the bulk occupied by a body. The volume of a body may be "real" or "apparent"; the real volume being the space occupied by the actual substance of which the body is composed, after making allowance for the pores or interstices that may be present; while the apparent volume is the space included within an imaginary surface which just takes in the body, interstices and all. The "apparent volume" of a heap of coal, for example, includes the "real volume" of each separate fragment of the coal, and also the empty spaces between these fragments, as they lie in the pile. See **MENSURATION**; **WEIGHTS AND MEASURES**; **METRIC SYSTEM**; **UNITS**.

Volume, Molecular or Specific, a value obtained as the quotient of the molecular weight of a compound body divided by its specific gravity.

Volumetric Analysis. See **CHEMICAL ANALYSIS**.

Volumometer, an instrument for determining the specific gravity of a solid by measuring the amount of water or other liquid displaced by it. A simple form is a flask having a long narrow neck, and an opening at the side through which the solid may be introduced. The neck is graduated from the bottom upward. The method of using it is as follows: The flask is filled to the zero mark with some fluid in which the solid is not soluble; on turning it on its side the stopper can be removed and the solid introduced; when turned back to an upright posture again the liquid is forced up the stem and the volume reading is the amount of liquid displaced by the solid. From this the specific gravity can be easily calculated.

Voluntary Controversy, a controversy begun in Scotland in 1780, and which continued obscurely until 1831, when it began to excite general interest, resulting at length in disruption of the Scottish Presbyterian Church, and to that remarkable action, by which, as a protest against state interference, on Tuesday, 23 May 1843, 396 ministers and professors renounced all claim to the benefices they had held in connection with the Establishment, declaring them to be vacant and consenting that they should be dealt with as such. By this memorable act of self-sacrifice in obedience to principle these ministers and teachers gave up an annual income amounting to at least \$500,000. See **FREE CHURCH**.

Voluntaryism, or The Voluntary System, a term applied to the support of ministers of religion and their churches by the voluntary contributions of the people, as opposed to the connection of church and state, and the support of the ministry from tithes or general taxation. Whenever the clergy receive stipends from the state, it is evident that the taxpayer, in addition to the voluntary support, if any, which he gives to some particular church, contributes through

taxation to the support of an established church, or of state-recognized churches in general.

In ancient times state and church were inseparable, and opposition to the church was regarded as treason to the state. This relation existed throughout the Middle Ages, and until a comparatively recent period, under the papacy, with the important difference that the state was regarded and treated as subordinate to the church, and as bound to obey its decrees. In the countries which accepted the Protestant doctrines in one form or another the relations of church and state were reversed, and the state, as represented by the sovereign, assumed control of the church, a fact which had much to do with the spread of the Reformation. While the conditions of the connection were changed, however, the tie between church and state became, in Protestant countries, even stronger than before, an ever-present and jealous monarch uniting in his own person the hereditary civil power of the crown, and the religious authority which had formerly been exercised by a distant pope. Dissenters from the established church became rebels, whereas before they had only been heretics, and the devastating civil wars of the 16th and 17th centuries were the outcome, in a large, if not a principal degree, of this new relation.

The dissenter from a church establishment did not seek to put a voluntary system in its place. If he triumphed in England or immigrated to America his aim was to create an established church of his own, and doom to stake or scaffold any intruder who disagreed with him. The colonies of Rhode Island and Maryland, the former founded by Protestants, the latter by Roman Catholics, were framed on the plan, then novel to the world, of toleration in matters of conscience, accompanied by its correlate, the voluntary system.

While the world has made admirable progress toward complete liberty of conscience, while the prison and scaffold no longer menace dissenters from an established creed, and men can be friends, and acknowledge each other's good qualities although differing pole-wide — to use Whittier's expression — in religious opinions, the voluntary system is still almost confined to the United States, Mexico, and the leading British colonies. State-supported churches are the rule, even in France and Germany, where all creeds are on an equal footing; in Switzerland, where absolute liberty of conscience is decreed by law, the magistrates keep a certain degree of supervision over religion, and Brazil, while providing in her constitution for absolute separation of Church and State, still supports the ecclesiastics who were in receipt of state support when the new relation came into force.

In the United States, saving the fact that church property is usually exempt from taxation, the voluntary system prevails everywhere, and only chaplains in the army and navy, and those who say prayers before public bodies, as at the opening of the United States Senate, receive pay from the public treasury. This universal voluntaryism did not come about with independence, or even with the adoption of the Federal Constitution. The first amendment to the Constitution of the United States provided that Congress should make no law respecting an establishment of religion, or prohibiting the free exercise

VOLUNTEERS — VOMITING

thereof. This, of course, did not affect the power of the several States to create or continue church establishments. The convention which framed a constitution for Massachusetts provided in the "Bill of Rights," that "the legislature shall authorize and require the several towns, parishes and precincts to make suitable provision at their own expense for the institution of the public worship of God, and the support and maintenance of public Protestant teachers of piety, religion and morality, in all cases where such provision shall not be made voluntarily." Officers known as tithingmen were appointed to collect the dues, and if a taxpayer defaulted, distress and even imprisonment followed. This system amounted to state support of the Congregational Church, and it was not until 1815 that dissenters from the prevailing creed were released from paying taxes to maintain the ministers of the majority. The involuntary system was abolished altogether in Massachusetts in 1833. In Connecticut the Constitution of 1818, while giving every society of Christians power to tax the members of such society, permitted any member to escape this obligation by giving notice of withdrawal in writing. And now, as for many years past, without any provision of the Federal Constitution to coerce the States, and by force of enlightened public opinion, voluntarism in the maintenance of ministers and churches prevails everywhere throughout the republic, and in no country in the world is religion better supported, while the clergy also, conscious of their freedom from state control, are self-respecting in their personal attitude, and devoted to the service of God and of their flocks.

Volunteers', a name applied to the citizens of a state or nation who of their own accord offer their services in a military capacity without the stipulation of a substantial reward. In all the American wars from the Revolution to the Spanish-American war, there were volunteer soldiers, companies and regiments. These were generally amalgamated with regular troops when it was found their services were available. In Great Britain in 1794 and again in 1803, when the threats of France agitated England, nearly the whole of the available male population was formed into volunteer companies, and the government at one time reckoned upon having nearly 500,000 efficient volunteers in arms. The numbers soon declined, and in 1815 the force almost ceased to exist. About 1857 a feeling of insecurity began to manifest itself in consequence of the alleged insufficiency of the national defenses, and the Victoria Rifles in London and one or two other corps were formed. In a short time the movement began to spread; in May 1859, the formation of volunteer corps of riflemen commenced under the auspices of government, and by the end of the year many thousands were enrolled. After four years' preliminary experience an act of Parliament relating to the force was passed in 1863; another was passed in 1869, and these, with subsequent acts and regulations, constitute the law relating to volunteers. The Volunteer Acts of 1896 and 1900 regulate offers by volunteers for actual military service outside Great Britain; and in the South African War a number of volunteers took part with great credit to themselves. There are also considerable numbers of volunteers in India, Canada, Australia, etc.

Volunteers of America, The, a religious body organized from former members of the Salvation Army (q.v.) in 1896 by Commander and Mrs. Ballington Booth and consisting of six regiments, embracing nine companies or central societies and nearly 100 self-supporting posts, not including outposts. The head officer is elected by the members as commander-in-chief, and by the directors as president. There are four branches of philanthropic work: (1) The sociological branch, which provides homes for destitute men. In 1903 the 10 homes located in various cities furnished lodging for 200,000 persons. (2) The Home of Mercy, branch for friendless young women maintaining one home in Newark, N. J., and one in Boston, Mass. (3) The tenement work for the worthy poor. (4) The philanthropic branch, working among unprotected children. The Prison League is an important department of volunteer activity. In 1903 there were branches in 15 States, embracing 7,500 prisoners and corresponding with 19,000 men. In 1903 there was an aggregate attendance of 1,113,683 persons at the hall meetings and 1,733,637 at the open air meetings.

Volusenus, Florentius. See WILSON, FLORENCE.

Volute', a spiral scroll used in Ionic, Corinthian, and Composite capitals, of which it is a principal ornament. The number of volutes in the Ionic order is four. In the Corinthian and Composite orders they are more numerous, in the former being accompanied by smaller ones, called helices; called also voluta. See ARCHITECTURE.

Volute Wheel, a volute shaped wheel that in revolving presents its open mouth to the air, which is thus gathered into the tube and discharged through the hollow axis. It is a common and effective sort of blower. Also, a water-wheel with radial or curved buckets, in which the periphery of the wheel is surrounded by a volute-shaped casing or scroll.

Volvox, a minute aquatic plant (*Volvox globator*), in the form of a pale green globule floating about in the water. Under the microscope it is seen to be a spherical membranous sac, studded with innumerable green points giving exit to cilia, which enable it to roll over and over in the water. Within the sac are various dense globules, generally green in summer, but often of an orange color in autumn and early winter. They are zoospore-like bodies, each sending a pair of cilia through separate orifices. There is a reddish brown spot and a contractile vacuole.

Vo'mer, one of the bones of the skull. See HEAD; SKULL.

Vomiting, the ejection of matter from the stomach through the mouth, mainly by spasmodic contraction of the abdominal muscles, assisted by the active co-operation of the muscular walls of the organ; the diaphragm remains fixed, affording a firm surface against which the stomach is pressed by the abdominal muscles. Relaxation of the sphincter at the cardiac orifice of the stomach is necessary, as its contraction will resist the power of all the expulsor muscles combined, explaining the violent and vain efforts to vomit so commonly seen and experienced; the act is preceded by a deep inspiration, the glottis being spasmodically closed during the paroxysm.

VONDEL — VOORSANGER

It may be produced by irritating substances applied to the mucous membrane of the stomach, the impression being conveyed by the pneumogastric nerves and the motor nerves of expiration, as in common emetics; by irritations in other parts of the body, transmitted by reflex nervous action, as in strangulated hernia, the passage of calculi, and during gestation; and by impressions received through the sensorial centres, whether emotional or sensational, as from tickling the fauces, disgusting sights or odors, and in seasickness; even the recollection of these sensations may cause vomiting in very impressionable persons. It is a common symptom of many diseases of the stomach and intestines, and arises from sympathy in affections of many other organs; it is sometimes nervous or spasmodic. Exclusive of the treatment proper for the special disease of which it may be the symptom, effective remedies for vomiting are ice, effervescing potions, mercurials, prussic acid and various narcotics, creosote, chloroform, and ether. In many birds and some mammals, the contents of the stomach are ejected as a means of offense, as in the petrels and vultures, and the llama. Vomiting is usually more easily induced in children than in adults. It is a frequent accompaniment of pregnancy (see OBSTETRICS), and is often prominent in disease of the kidneys (q.v.), tuberculosis (q.v.), etc. Vomiting is in many cases entirely salutary, and in such cases is to be encouraged and assisted.

Vondel, vôn'dël, **Joost van den**, Dutch dramatic poet: b. Cologne 17 Nov. 1587; d. Amsterdam 5 Feb. 1679. His parents, who were Anabaptists, removed to Holland while he was a child, and the poet afterward adopted the Arminian faith, but finally died in the bosom of the Roman Catholic Church. Nature had endowed him with extraordinary talents, and he derived little aid from education. Devoting himself entirely to the cultivation of Dutch poetry, Vondel first learned Latin and French in the 30th year of his age. His works display genius and elevated imagination, and embrace lyric and didactic poems, satires, an epic, and some 30 tragedies, some of which are founded on biblical subjects and bear such titles as 'Lucifer,' 'Noah,' 'Jephtha,' etc. These enjoy a high reputation in Holland, and the interspersed choruses may be regarded as the finest lyrical productions of the Dutch muse. The best collective editions of his works are those by Jan van Lennep (1850-69) and Unger (1890 onward). The dramatic poem 'Lucifer' (1654) is his greatest work and by some critics is supposed to be the source of the inspiration of Milton's 'Paradise Lost,' but this may reasonably be doubted. English translations of Vondel's 'Lucifer' (1808); 'Samson' (1903); and 'Adam' (1903) have been made by C. Van Noppen (q.v.). Consult 'Lives' by Baumgartner (1882); Hack (1800); Looten, 'Etude littéraire sur Vondel' (1889); Müller, 'Ueber Miltons Abhängigkeit' (1891).

Von Holst, fôn hōlst, **Hermann Eduard**. See HOLST, HERMANN EDUARD.

Von Mannlicher, fôn mǎn'lih-ër, **Ferdinand**. See MANNLICHER, FERDINAND VON.

Von'noh, **Robert William**, American artist: b. Hartford, Conn., 17 Sept. 1858. He studied at the Massachusetts Normal Art School, Boston, 1875-9; was instructor there in painting

and drawing, 1879-81; in 1881-3, and again from 1886 to 1891, studied in Paris, teaching in the interval at the Museum of Fine Arts, Boston. He acquired a manner in which realism and impressionism are emphasized by dramatic effects and boldness of treatment in light, color, etc. Whether in portrait, figure, or landscape painting, his work has individuality and interest, and his success particularly as a portrait-painter has been marked. From 1891 to 1896 he was principal instructor in portrait and figure painting at the Pennsylvania Academy of the Fine Arts. He has exhibited much in this country and in Europe. Among his works are: 'Sad News'; 'Miss Mildred Blair'; 'Little Louise'; etc.

Voodoo. See VOODOO.

Voorhees, voor'ez, **Daniel Wolsey**, American legislator: b. Liberty, Ohio, 26 Sept. 1827; d. Washington, D. C., 10 April 1897. He was graduated from Indiana Asbury (now De Pauw) University in 1849, admitted to the bar in 1851, and engaged in law practice at Covington, Ind. In 1858-61 he was United States district attorney for Indiana, and he was attorney for the defense of John E. Cook during the latter's trial for participation in John Brown's raid. He was member of Congress in 1861-6 and in 1869-71, and from 1877 to a few months before his death, United States senator from Indiana. He was a member of the finance committee throughout his entire career in the Senate, and an advocate of the free and unlimited coinage of silver until 1893 when he cast his vote to repeal the silver-purchase clause of the Sherman act. He was largely instrumental in securing the erection of the Congressional Library building, and was noted as an orator.

Voorhees, Philip Falkerson, American naval officer: b. New Brunswick, N. J., 1792; d. Annapolis, Md., 26 Feb. 1862. He was appointed midshipman in the navy in 1809, served in the War of 1812, participated in the capture of the Macedonian and the Epervier, and received a Congressional medal of honor for his services. He attained rank as captain in 1838 and was assigned to command the Congress, in which capacity he captured, in 1844, an Argentine squadron and an allied cruiser which had fired on an American ship. His action was commended in home and foreign diplomatic circles, but he was tried by court-martial. His course was vindicated and in 1847 he was assigned to command the East Indian squadron, a position equal to the rank of rear-admiral, which had not then been established in the United States navy. He was placed on the reserve list in 1855, an action against which he appealed to President Buchanan as unjust. A decision favorable to Voorhees was rendered by Attorney-general Black and he was restored to the leave pay-list.

Voorsanger, foor'säng'ër, **Jacob**, American rabbi and educator: b. Amsterdam, Holland, 13 Nov. 1852. Taught at the theological seminary of his native city, he came to the United States about 1870, and was rabbi at Philadelphia (1873-6), Washington, D. C. (1876-7), Providence, R. I. (1877-8), and Houston, Texas (1878-86). Since 1886 he has been rabbi of Temple Emanu El, San Francisco, Cal. He edited 'The Sabbath Visitor' for three years,

VORONEZH — VORTIGERN

besides making numerous contributions to leading Jewish weeklies. In 1884 he was elected professor of Semitic languages at the University of California. He has written: 'Moses Mendelssohn, Life and Works'; 'Chronicles of Emanu El.' He founded in 1895 a weekly, 'Emanu El,' which he continues to edit.

Voronezh, vō-rō'nězh, Russia, (1) The capital of a government of same name, on a height above the Voronezh, near its confluence with the Don, 290 miles south-southeast of Moscow. It consists of a high town, a low town, and three extensive suburbs—is well built, and has a cathedral, an episcopal palace, town-house, gymnasium, diocesan seminary, arsenal, hospital, and poorhouse; manufactures of woolen and linen cloth, soap, and vitriol, numerous tanneries, a considerable trade in corn and tallow, and important fairs and markets. Voronezh has interesting associations of Peter the Great, and of the poets Nikitin and Koltsoff. Pop. (1897) 84,146. (2) The southern government of Voronezh has an area of 25,443 square miles. It is intersected by the Don, which receives the whole of the drainage, partly through its tributaries, the Voronezh and Khoper. The soil is generally fertile, and large crops of grain are raised. The breeding of horses and sheep is an important industry. Manufactures are considerable, and there is an extensive trade. Pop. (1897) 2,546,255.

Vörösmarty, vē'rěsh-märt-y, **Michael**, Hungarian poet: b. Nyék, comitat of Stuhlweissenburg, 1 Dec. 1800; d. Budapest 19 Nov. 1855. He studied in Pest, practised for a time as an advocate, in 1848 was a member of the National Assembly, and was twice imprisoned for political reasons by the Austrian government. A memorial to him was placed at Stuhlweissenburg in 1866. Among his poems and dramas were: 'King Solomon' (1821); 'The Victory of Faithfulness' (1823); 'Zaláns Flight' (1825); 'Cserholom' (1826); 'Erlau' (1828); 'Csongor and Tünde' (1831); 'Banus Marót' (1838). Gyulai prepared a collective edition (1864; 2d ed. 1884) and a biography (1864; 4th ed. 1896).

Vorse, Albert White, American editor b. Littleton, Mass., 18 Aug. 1866. He was graduated from Harvard in 1889, was connected with the *Philadelphia Press* 1891-3, the *New York Mail and Express* 1894-6, and subsequently with the 'Illustrated American' and the 'Criterion' 1899-1901. He has published 'The Laughter of the Sphinx' (1900).

Vortex, a whirlpool or eddy; any fluid rotating around an axis. The name is applied to pools, waterspouts, whirlwinds, and on a larger scale in cyclones and storms generally. Descartes supposed certain vortices to exist in the ether of space endowed with a rapid rotatory motion and filling all space, and by these he accounted for the motions of the universe.

Vortex Atom. See VORTEX MOTION.

Vortex Motion. The motion of a mass of fluid (including under this term gases and liquids) is known if the motion of every infinitesimal portion, or particle, of the mass is known. The motion of a particle is investigated by referring the successive positions it occupies in its journey to a set of three straight lines, or axes, which pass through the same point and are mutually rectangular. With respect to these

axes the motion of the particle may assume either one of two characteristic types. It may move without rotation about either of the axes, or it may move with rotation about one or more of the axes. The former type is called irrotational motion, and the latter type is called rotational motion, or vortex motion. The vortex type of motion is by far the more common in nature and manifests itself in an infinite variety of ways. One of the most striking examples of vortex motion is seen in smoke rings emitted occasionally by locomotives and other high pressure steam-engines when exhausting slowly. Similar and more definite rings are easily produced also by devices now common in physical laboratories. Helmholtz, who was the first to investigate the theory of vortex motion, showed that vortex rings and filaments, or combinations thereof, in a perfect liquid (which is an ideal frictionless fluid of constant density) are indestructible. Extending this idea to perfect fluids, Lord Kelvin has imagined that the atoms and molecules of physical science may be vortex rings or filaments, or combinations thereof, in the ether. For the theory of vortex motion and references to the literature of the subject, consult Lamb, 'Hydrodynamics.'

Vortex Ring. See VORTEX MOTION.

Vorticella, vōr-tī-sē'l'a, a family (*Vorticellidae*) of attached or free forms of peritrichous ciliates, in which the adoral zone of cilia, where seen from above, forms a right spiral (dextro-tropic), while a secondary circlet of cilia near the aboral end may be either permanent or transient. The true vorticellids, represented well by the common bell-animalcule, are without a permanent second circle of cilia, and the peristome may be completely included within a peristome fold which contracts sphincter-like about it. The stem is either firm and constant in length, or flexible and capable of being contracted suddenly when it becomes a short close spiral. The individuals also are mounted on a single unbranched stalk or grouped on a common branching stalk in colonial existence. The simplest type of reproduction is longitudinal division, which may result in producing two individuals in a branched stalk, or one of the two may become detached and, propelled by a newly-formed circle of cilia near the basal end, lead a free existence for a time. Soon the free form settles down and develops a stalk. Conjugation has been observed and always takes place between a stalked form and a free-swimming form produced by budding. The bell-animalcule has long been a favorite object of microscopical study from its abundance and easily observed structure and activities. Ehrenberg (1838) made an extensive study of these organisms, and maintained that they possessed the complete organ systems of higher forms. The demonstration of their unicellular nature necessitated the abandonment of this view. The group is rich in number and variety of species.

HENRY A. WARD,
University of Nebraska.

Vortigern, vōr-tī-gěrn, a semi-mythical British king of the 5th century, who, according to Gildas, Bede, Ethelwerd, and the 'Old English Chronicle,' invited Hengist (q.v.) and Horsa to assist him against his enemies the Picts and Scots. Whether invited by Vortigern or not, the newcomers are said to have turned

VOS — VOTING MACHINE

against him and wrested from him the Kentish territory. There is something like unanimity in the chroniclers regarding Vortigern's character. They make him tyrannical and licentious. It is to be presumed that he came to a violent end in conflict with the invaders who had established themselves in his dominions.

Vos, vös, Geerhardus, American Presbyterian theologian: b. Heerenveen, Holland, 14 March 1862. He was educated at the seminary of the Holland Christian Reformed Church at Amsterdam and at Princeton Seminary, and was professor of theology in the former institution 1888-94, and since the year last named has held a similar post at Princeton. He has published 'The Mosaic Origin of the Pentateuchal Codes' (1886); 'De Verbondsleer in de Gereformeerde Theologie' (1891); etc.

Vos, Maarten de, Flemish painter: b. Antwerp 1532; d. there 1603. He studied in Antwerp under his father, Pieter de Vos, and De Vriendt, and at Venice under Tintoretto, established a school of painting in his native city in 1538 and became one of the most popular artists of his day, hundreds of engravings of his paintings and drawings being made. Among his works are 'The Triumph of Christ'; 'Cæsar's Penny'; 'The Marriage at Cana,' in the cathedral at Antwerp; 'Saint Luke Painting the Portrait of the Virgin.' He is sometimes styled 'the Elder,' in distinction from his son Maarten (b. 1576; d. 1613), also an artist.

Vosges, vözh, a European chain of mountains about 100 miles long, partly on the frontiers of France and the German territory of Alsace, partly in Alsace, extending from north-northeast to south-southwest, nearly parallel with the Rhine, and forming a continuation of the Jura Mountains, which separate France from Switzerland; the breadth varies from 20 to 45 miles. The highest summit, Ballon-de-Guebwiller (the summits are generally called ballons), has a height of 4,685 feet above the surface of the sea. The Vosges Mountains have a gentle declivity, and on the eastern and southern sides are covered with vineyards. Great part of the Vosges is densely wooded, and, besides abounding in game, they possess great mineral wealth, including silver, copper, iron, lead, coal, and antimony. They also contain excellent pasturage; and the inhabitants breed many cattle. The Ill, Lauter, Moselle, Meurthe, Saar, and Saône rise in this chain of mountains.

Vosges, France, an eastern department bounded on the north by the departments of Meuse and Meurthe, on the east by Alsace, on the south by the departments of Haute-Saône, and on the west by Haute-Marne; area, 2,303 square miles; capital, Epinal. The department derives its name from the mountain-chain which bounds it on the east, and sends out ramifications over the greater part of its surface. Its south portion is traversed east to west by the chain of the Faucilles. In the lower grounds, on an elevated but tolerably flat tract, grain, hemp, flax, and potatoes are extensively raised. The wine produced is indifferent, but the department has long been famous for its kirsch-wasser made from the produce of extensive cherry-plantations. The principal rivers are the Meuse, Mouzon, Madon, Moselle, Saône, and Meurthe; but none of them are navigable within

the department. The minerals include argentiferous lead, copper, iron, antimony, cobalt, marble, millstones, slate, kaolin, and fine agates. The chief manufactures are the famous Gêrome or Munster cheese, cotton and linen cloth, lace, musical instruments, turnery and wooden clogs, nails, iron, steel and iron ware, paper, leather, pottery, and glass. Pop. (1901) 421,104.

Voss, fös, Johann Heinrich, German poet and translator: b. Sommersdorf, near Waren, Mecklenburg, 20 Feb. 1751; d. Heidelberg 29 March 1826. He early began to write verses, and some of these contributed to the 'Göttingen Musenalmanach' led to a correspondence with Boie, upon whose invitation he went in 1772 to Göttingen. Here he studied the classical and modern languages, and was one of the founders of the Göttinger Dichterbund. The editorship of the 'Musenalmanach' was handed over to him by Boie in 1775; in 1778 he was made rector of Otterndorf in Hanover, in 1782 at Eutin. In 1781, after the publication of several treatises, he produced his German 'Odyssey,' a work which has rendered this grand poem national with the Germans (new ed. by Bernays 1881). This has been called 'the most perfect rendering of Homer into a modern tongue.' In 1793 appeared his translation of the 'Iliad,' and that of the 'Odyssey,' in a new form, in which, however, it did not please so much as before, the former displaying greater truth and naturalness. He published in 1795 an idyl in the epic form called 'Luise,' printed first in 1783, but now produced with improvements. His translation of the whole of 'Vergil' (1799) was revised for the edition of 1821. In 1805 he went as professor to Heidelberg, where he remained till his death. Voss rendered good service to the study of classical antiquity, and threw fresh light upon many subjects. At a translator he exhibited wonderful command of language and great skill in the handling of metres. Among his translations that of Homer's works is undoubtedly the greatest; we may also mention, in addition to his 'Vergil,' his 'Hesiod' (1806); 'Horace' (1806); 'Theocritus, Bion and Moschus' (1808); 'Aristophanes' (1821); 'Tibullus' (1810); 'Propertius' (1830); and selections from 'Ovid' (1708). He also undertook, with his sons, a translation of Shakespeare, which was completed in nine vols. in 1829, but this translation cannot stand a comparison with Schlegel's. Consult lives by Paulus (1826); by Herbst (1872-6); Prutz, 'Der Göttinger Dichterbund' (1841).

Vote. See **BALLOT**.

Voting Machine. The wave of ballot reform which swept over the United States of America immediately after the year 1888 firmly established the Australian or blanket ballot as a factor in the elections of practically all of the States of the United States of America. This ballot was intended to encourage freedom of choice on the part of the voters, and while it seemingly makes it easy to split the ticket (or to cast an independent ticket) it oftentimes disfranchises the voter because of his mistake in marking it. The introduction of the Australian ballot opened the way for voting machines and demonstrated the need of them. The voting machine is a mechanical Australian ballot, having for its object the correcting and preventing of the abuses to which the Australian ballot sys-

VOTING MACHINE

tem is susceptible, and expediting the returns; it accords to each voter his full voting privilege, it prevents him from making mistakes that would take his ballot out of compliance with the law, and makes it unnecessary for the judges to inspect the ballot to determine its legality. The machine counts the ballot for each candidate at once, making it a part of the total vote. When a vote is cast, the operating devices are automatically reset and the machine is again ready for operation by another voter. Machines include safeguards against frauds by election officers. They make it more easy for the voter to accomplish his work, and prevent him to a great extent from making a partial or complete failure in voting. The use of them compels secrecy, reduces the amount of labor involved on the part of election boards, secures greater economy in the expenses of election, and gives the returns at once on the closing of the polls.

The Requisites of a Complete and Legal Voting Machine.—A voting machine must enable a voter to cast his vote in secret; that is, so that no one can see or know for whom he has voted.

The method of voting must be simple, and within the comprehension of all classes; so that illiterate or blind persons, after receiving instruction, can vote without assistance.

It must be convenient in its operation.

It must permit a voter to vote for all of the candidates nominated by any party, or to vote in part for the candidates of one party, and in part for the candidates of other parties, and provide for voting for persons who are not nominated by any party, for any office.

It must give the voter perfect freedom in his selection from any of the candidates without regard to their position on the machine. For some offices, but one candidate is to be voted for; for others two or more may be nominated by each party.

It must be beyond the power of the voter to vote for more persons than he is entitled to vote for, or to vote twice.

It must permit a voter to change his vote, or correct a mistake, while he is in the booth.

It must permit a voter to split his electoral vote.

It must permit voting on questions.

It must permit limited or restricted voters (females or others) to exercise their rights under the law, but not to exceed them, either for candidates or questions.

It must count, positively and accurately, every vote cast.

It must prevent defective ballots.

The counters should be so placed, that they can be conveniently examined before and after the election.

All the moving parts should be controlled by locks, so that the register of the vote shown on the counters cannot be changed, thus maintaining a permanent record during the time prescribed by law.

The voting machine must be so constructed that it cannot be unlawfully manipulated by anyone, under conditions that prevail in elections legally conducted.

It must be able to bear the most rigid scrutiny of expert mechanics and others qualified to judge of the merits of such mechanism.

There must be simple and positive action

of the working parts, which must be so related that if misplaced by the voter either by accident or design, no injury will result from the further operation of the machine.

Extent of Use.—The first voting machine built and actually used in an election was the Myers Voting Machine; the invention of Jacob H. Myers; it was used in the election of the town of Lockport, N. Y., in 1892, and attained considerable use elsewhere in that State. This machine was legalized in the State of New York, as well as the States of Connecticut and Michigan. Afterward improved machines began to make their appearance. The inventions of Sylvanus E. Davis and Alfred J. Gillespie resulted in the Standard and U. S. Standard Voting Machines, which have attained the greatest use and perhaps the greatest celebrity in the voting machine art. These machines are used extensively in the States of New York, Connecticut, Wisconsin, Michigan, Indiana, New Jersey, and California. They are the only method of conducting elections in 24 cities and 272 villages in the State of New York. The election for the entire city of Rochester, N. Y., in 1898 was held by 73 of these machines and the election was the first complete and convincing demonstration of the practicability of using voting machines on a large scale.

In Buffalo, N. Y., these machines have been used in the elections since 1899; the returns from all of the 108 election districts with over 60,000 voters have been received and tabulated at the City Hall in 35 minutes, and papers sold on the streets within one hour after the closing of the polls, although the ticket was of considerable size, containing some 150 candidates.

The U. S. Standard Machine.—The U. S. Standard Voting Machine has an upright keyboard, on which the party rows of candidates and keys therefor are arranged in horizontal lines with the lines of the offices transverse thereto. At the end of each party row a lever is provided by means of which all of the keys of that party row may be moved together to a voting position over the names of the candidates nominated by that party; or the keys may be moved separately to a voting position over the names of the candidates for which the voter desires to vote. Before the voter can arrange his ticket he must enter the booth by closing the curtain around him to shield himself from the public, after which he pulls either a party lever for straight ticket voting or a releasing lever, to unlock the keys to enable him to prepare his ballot independently. The machine affords the voter an opportunity to cast a straight party ticket, to split his ticket, to correct mistakes, to vote for candidates not in nomination and gives him all facilities to cast only a legal vote, which is sure to be counted as he indicates. If constitutional amendments or questions are submitted to the people, they can be voted on, provisions being made to vote "yes" or "no" on all such questions or amendments. By opening the curtain the voter counts his vote and sets the machine for the next voter. The total vote for each candidate and question is given at once at the close of the election. The machine is also equipped with lockouts which are operated by the election officers to prevent particular voters from voting for offices or on questions on which they are not entitled to vote.

The machine is provided with a protective counter which counts up to 1,000,000 and cannot be reset, and reliably indicates whether the machine has been operated or changed after it has been prepared for an election, or after the close of an election.

The Abbott Machine.—The Abbott Machine has had some use in the State of Michigan, being legalized by the laws of that State. It has all of the candidates for one office mounted on a slide, which can be adjusted according to the wishes of the voter. He can move the office slides to the right or to the left, so as to bring the name of the candidate desired into line with the operating bar, by the operation of which the vote is registered on counters. The machine is limited, however, in that it cannot group; that is, provide for the voting for two or more candidates on one office line, which is always necessary when two or more candidates are to be elected to an office.

The Bardwell Machine.—The Bardwell Machine, which has been used to a limited extent, has the candidates arranged in office lines and party rows. When the voter enters the booth, he is furnished with a key which he inserts in the key-hole belonging to the candidate he wants to vote for, and turns it half way around. This counts a vote for that candidate and locks the other candidates for the same office from receiving a vote, and by repeating this operation on other office rows the voter is enabled to cast his vote as he desires for the whole ticket. In case he has made a mistake by casting a vote for the wrong candidate, he can withdraw this vote by again inserting the key in its key-hole and turning it backward. Straight party tickets are counted on separate counters, the operation of which, by the voter, locks the balance of the counters against operation, but the total of the counters must be added to the counters of the candidates of that party at the end of the election.

CARL F. LOMB,

United States Standard Voting Machine Co.

Voodoo', or Voodoo, a common name applied by the negroes of the West Indies and the United States to certain superstitious rites and beliefs brought originally from Africa. In the Southern States, before the Civil War, voodooism was generally practised among the slaves, and voodoo doctors were common. Many of these doctors were skilful poisoners, and while the great mass of their professed art was a rank imposture, still they possessed enough of devilish skill to render them objects of wholesome dread. Their services were more often invoked in destructive than in curative offices. If a negro desired to destroy an enemy, he sought the aid of the voodoo, who, in many cases, would undertake to remove the obnoxious one, and the removal was generally accomplished through the medium of poison. No doubt exists that in many cases the victim of a voodoo died from sheer fright, for whenever a negro had reason to think that he was possessed by the spell of the voodoo, he at once gave up all hope, thus hastening the accomplishment of the end toward which the energies of the sorcerer were directed. Their incantations and spell workings were always conducted with the greatest secrecy, no one being allowed to witness the more occult and potent portion of their ritual.

Vol. 16—34

Vouet, voo-ä, **Simon**, French painter: b. Paris 9 Jan. 1582; d. there 30 June 1649. At 14 he went to London where he was already able to make a living by his art, and going to Constantinople in 1611 obtained many commissions there. The next year he studied the works of Paul Veronese at Venice and was later made president of the Roman Academy, but was presently recalled to Paris and made court painter by Louis XIII. The progress of French art was much advanced by him, and among noted pupils of his were Lebruns, Lesueur and Mignard.

Voussoir, voo-swär', an architectural term meaning one of the stones which form the arch of a bridge, vault, etc., and are always cut more or less in the shape of a truncated pyramid or wedge. The under sides of the voussoirs form the intrados or soffit of the arch, and the upper sides the extrados. The middle voussoir is called the keystone of the arch. See ARCHITECTURE.

Vow, a solemn promise made to perform some act, or to follow out some line of conduct, confirmed by an appeal to the Supreme Being, or supernatural power, to favor or to punish the maker of the promise according as he fulfils or breaks such promise. Some vows bind those who make them to perform a certain act out of gratitude for a particular favor, as in the case of Jephthah; others comprehend the performance of certain limited duties during a whole life-time, as the marriage-vow and a sovereign's coronation oath; and others, again, give a particular form to the entire character of a man's life, as the monastic and priestly vows. Among Roman Catholics vows are divided into two kinds: Solemn, those taken in the face of the Church; and simple, those made in private. Bishops are considered to have the power of releasing from simple vows generally; but the power of dispensing in important simple, and in all solemn vows rests with the pope; the vows specially reserved for papal dispensation were: that of absolute and perpetual chastity, entering into a religious order, making a pilgrimage to Rome or Compostella, or of setting out on a crusade. See RELIGIOUS ORDERS.

Vowel (from the French *voyelle*; Latin, *vocalis*), a simple articulated sound, which is produced merely by breathing, accompanied by a constriction in the larynx, a greater or less elevation or depression, expansion, and contraction of the tongue, and contraction or expansion of the lips. The vowel sounds of the English alphabet are imperfectly represented by five letters, *a, e, i, o, u* (and sometimes *w* and *y*); the deficiency of our alphabet may therefore be seen at a glance, when we mention that there are at least 13 distinct shades of vowel-quality in the spoken language as heard in the words *ale, an, ask, ah, all; ell, err; eel, ill; old, ore; pull, oose*. The long sound of *i*, as in *ire*, and of *y*, as in *by*, although represented by one letter, are really compound vowel sounds or diphthongs. The French simple vowel sounds *u* and *eu*, and the German *ö* and *ü*, are not heard in the English language. See the articles under the several letters.

Voyageur, vwo-ya-zhër', a French-Canadian term for traveler. It was specifically applied to a class of men employed by the fur companies in transporting goods by the rivers and

VOYNICH — VULCANIZATION

across the land to and from the remote stations of the Northwest. They were nearly all French Canadians or half-breeds.

Voynich, voi'nich, **Ethel Lillian Boole**, English novelist: b. 1864. She was a daughter of G. Boole (q.v.), and was married to W. M. Voynich, a Polish writer in England. She is the author of 'Russian Humor'; 'Stories from Garshin'; 'The Gadfly,' a very striking story which excited much attention (1897); 'Jack Raymond' (1901).

Voysey, voi'zī, **Charles**, English theistic clergyman: b. London 18 March 1828. He was graduated from Oxford in 1851, took Anglican orders and was curate of Hesse, Yorkshire, 1852-9, of Creighton, Saint Andrews, Jamaica, 1860-1, and of Saint Marks, Whitechapel, London, 1861, but lost the last position on account of a sermon of his against endless punishment. He was vicar of Healaugh, Yorkshire, 1864-71, but having published in 1865 sermons declared to be opposed to the Bible and the 39 articles, he was prosecuted in the Chancery court and the case being taken to the judicial committee of the Privy Council he was deprived of his living and forced to pay the costs in 1871. He subsequently founded the Theistic Church in Swallow Saint Piccadilly, London, the church being supported by the "Voysey establishment fund." Among his published works are: 'The Sling and the Stone' (1872-93); 'Theism as a Religion of Common Sense' (1894); 'Theism as a Science of Natural Theology and National Religion' (1895); 'Testimony of the Four Gospels concerning Jesus Christ' (1896).

Vred'enburg, Edric **Walcott**, English novelist: b. Para, Brazil, 29 March 1860. He was educated at Tonbridge School, Kent, entered the army and was a lieutenant in an Essex regiment. He has since given his attention to writing novels as well as stories and verse for children. Among his works may be cited: 'The Haunted House in Berkeley Square'; 'A Bitter Inheritance'; 'At the World's Mercy'; 'By the Queen's Command.'

Vree'land, **Herbert Harold**, American railway president: b. Glen, Montgomery County, N. Y., 28 Oct. 1856. He received a common school education and worked his way upward from a humble position to that of railway president. In 1893 he became president and general manager of the New York Metropolitan Street Railway Company and was prominent in the consolidations which subsequently placed all surface railways on Manhattan Island under one management.

Vriendt, frēnt, **Frans de**. See **FLORIS**, **FRANS**.

Vriesland, frēs'lānt. See **FRIESLAND**.

Vryheid, fri'hid, South Africa, a town of Natal, prior to the South African war, 1899-1902, belonging to the Transvaal Republic. It is about 280 miles north of Durban by the railway through Pietermaritzburg, Ladysmith, and Dundee, in the centre of a district containing coal, gold, and other minerals. It has Dutch Reformed, Anglican, Wesleyan, and other churches, a masonic temple, schools, and mineral springs. The district of Vryheid was ceded to a party of Boers by Dinizulu, a Zulu chief, in 1884, and was constituted a separate state under the title of the

New Republic. In 1888 it was incorporated in the Transvaal. The white population of the district is about 5,800; of the town, 2,400.

Vuillaume, vwē-yōm, **Jean Baptiste**, French violin maker: b. Mirecourt 7 Oct. 1708; d. Paris 19 Feb. 1875. He settled in Paris in 1818, and imitated the instruments of Stradivarius, the Amatis and Maggini. He came to stand with Lupot at the head of French musical instrument makers of the 19th century. Long journeys were made by him after special kinds of woods, and he was constantly experimenting toward improvements. He received many distinctions. In the Paris Exposition in 1867 he was ranked above competition.

Vul'can, the Roman god of fire and patron of metallic handicrafts; the son of Jupiter and Juno, and identical with the Greek Hephaestus. According to mythology Vulcan was ugly and deformed, and Juno, ashamed to own such a child, dropped him from heaven, when the infant god, falling into the sea, was rescued and adopted by Thetis, who kept him till nine years of age. He was then restored to his parents. Soon after his return to Olympus, Vulcan took his mother's part in one of the quarrels between husband and wife; Jupiter, enraged at Vulcan's audacity, flung him from heaven. The youth alighted on the island of Lemnos, breaking his ankle in the fall; here he raised forges and workshops, and became the chief of artificers. Some poets, however, fix his workshop on Olympus, another on Etna, where Cyclops were his chief assistants. He fashioned Pandora, and had Venus given him for his wife, by whom he was father of Cupid. Vulcan is represented bearded, covered with dust and soot, and toiling hard at his forges.

Vulcan, in astronomy, the name given a planet between the Sun and Mercury. In 1859 M. Lescarbault, a village physician of Orgères, France, saw a small dark planet-like body pass across the sun's disk. The planet was called by anticipation Vulcan, but its existence still remains unconfirmed, though M. Porro and M. Wolf of Zürich reported seeing its transit in 1876.

Vulcanist, the name applied to an old school of geologists at the end of the 18th and the beginning of the 19th centuries, who held that most rocks, but particularly the basalt, were due to volcanic or igneous agencies. They were opposed by the Neptunists led by Werner, who believed that this rock in common with most others was the product of crystallization from water.

Vul'canite, the harder of the two forms of vulcanized caoutchouc (see **VULCANIZATION**). It is differentiated from the softer product (soft rubber) in containing a larger quantity of sulphur and being cured at high temperatures. In color it is dark-brown, almost black, but it may be made jet-black by litharge or red by vermilion. It is not affected by the caoutchouc solvents, or by the mineral acids and alkalis. Owing to the large quantity of electricity evolved by it when rubbed, it is much used for the plates of electrical machines. The other applications of it are, of course, very numerous. Ebonite is a rarer name for it. See **INDIA-RUBBER**; **RUBBER MANUFACTURES**, **AMERICAN**.

Vulcaniza'tion, a method of so treating caoutchouc (q.v.) with some form of sulphur as

VULGATE

to effect certain definite changes in its properties and obtain a softer or harder product. The former is known as soft rubber, the latter as vulcanite (q.v.). The method of preparation of soft rubber goods is in general as follows: The gum is mixed with the suitable proportion of sulphur (usually 5 to 6 per cent), while other ingredients are added to make the caoutchouc, the most expensive constituent, go as far as possible. These other substances include litharge, whiting, and white-lead, a common formula being, rubber 16, sulphur 1, litharge 2, whiting 14, white-lead $2\frac{1}{2}$. For some purposes, fabrics of cloth and rubber, and refuse vulcanized rubber, are also used in the mixture. After the mixture has been reduced to uniformity and rolled into sheets, it may readily be fashioned into any required shape. It may also be applied to one side or both sides of canvas or cloth, and, owing to the pronounced adhesiveness of the mixture, the coated goods may be fashioned into articles of practically a single piece. The harder product (vulcanite) is prepared in much the same way, the chief difference being in the proportion of sulphur, which is 6 to 8 parts, and in the high heats employed in curing. The process of vulcanization was invented by Charles Goodyear (q.v.), who obtained his first patent in connection with it in 1844. See INDIA-RUBBER; RUBBER MANUFACTURES, AMERICAN.

Vul'gate, The, is the Latin translation of Bible, due mostly to Saint Jerome (q.v.), which has been adopted as the authorized Bible of the Roman Catholic Church. The name, *vulgata biblicorum editio*, which means common or current edition of the Scriptures, was first applied to the Septuagint and then to the Old Latin Version derived from it; but after Saint Jerome's new translation came into common use, it inherited the name. Some scholars still speak of the Old Latin Vulgate or the Greek Vulgate; but the name, used without qualification, properly applies only to the official Roman Catholic Bible.

Place in History.—Neglected for a long time, the Vulgate has during the last few decades won back from scholars a recognition of its intrinsic excellence, its importance for the study of the Bible text, and its place in history. In English-speaking countries, this is due mainly to the labors of Anglican divines, such as Westcott, Wordsworth, White, Scrivener, and Burkitt. Westcott, for instance, regards it as "not only the most venerable, but also the most precious monument of Latin Christianity." Its great antiquity and the exceptional qualities of its translator make it a most valuable aid toward the recovery of the original text. Its New Testament, in its revised form, is contemporary with the oldest Greek manuscripts and embodies a much earlier text. The Old Testament antedates by several centuries the oldest Hebrew manuscripts. Almost from the time of its publication, the Vulgate has had a very great influence upon the religion and civilization of Europe. It gradually became the Bible of Europe; it has been called *the book of the Middle Ages*. Latin then was the language of the educated and the Vulgate their Bible. From it was derived the theological language of Europe and much of its thought. Hebrew idioms came through it to enrich our daily speech. National

literatures took their rise in ventures to translate it: its text called forth the most beautiful work of the illuminators of manuscripts. Poetry, painting, and music owed to it much of their inspiration and grandeur. "It was the real parent," says Westcott, "directly or indirectly, of all the vernacular versions of western Europe," except the Gothic of Ulphilas. The translators of the Protestant versions had it constantly in hand; though it was "the guide" rather than the source of their work. Upon English Bibles, its influence is very marked, particularly upon the Authorized Version. The Psalter of the Prayer Book, still used in worship, is a translation of the Vulgate: such naturally, too, are all modern Roman Catholic versions, like the English Douai Bible.

Latin Bible Before Saint Jerome.—The Vulgate, we have implied, was preceded by an earlier Latin Bible, and its history cannot be properly understood without some account of its forerunner. Throughout the 4th century, this Old Latin Version, as it is called, was read in all the churches of northern Africa and western Europe, but the tradition of its origin seems to have perished. It is known that it was based, not on the original Hebrew, but upon the Greek of the Septuagint. This is its most notable difference from the Vulgate. It can be traced back with certainty to the middle of the 3d century and, with great probability, even a century earlier. Its place of origin is unknown; nor even can we determine whether there were several distinct translations, made in different times and countries, or originally but one. The Old Testament has survived in a few books and many fragments, but these do not shed much light on their origin; and the many manuscripts of the New Testament furnish to scholars no satisfactory solution. The old Latin Version is historically important by reason of its influence upon the Vulgate; moreover, despite its variations, it is a witness of the highest value to the current New Testament text of the 3d century. The books and fragments of the Old Testament also aid in determining the text, and sometimes the arrangement, of the Septuagint. Certain books of this ancient version, we shall see, were revised by Saint Jerome and incorporated in the Vulgate; a few were adopted without change and remain part of the Catholic Bible. It was the corrupt condition of the existing Latin text that caused Saint Jerome to undertake, first, a revision and then a translation of the Bible. We must remember that in his day, toward the end of the 4th century, the old version had been in circulation about 200 years. It is easy to see to what chances of corruption it was exposed. Experience proves that no manuscript can pass through many hands without the introduction of frequent changes and in the case of this old version, more than the ordinary causes of corruption seem to have been at play. Saint Augustine (q.v.), a younger contemporary of Saint Jerome, was so conscious of the almost innumerable variations in the current text that he advanced the theory—or possibly we should say, handed down the tradition—that there were almost innumerable distinct translations. Saint Jerome goes even further, stating that there were nearly as many types of text as there were manuscripts. This much is clear, that the confusion was almost hopeless and very perplex-

ing, whether we consider public worship or private devotion. There was an urgent need of a revised text, and Latin Christendom was most fortunate in possessing two men fitted to furnish it, Damasus the pope and Jerome the scholar. Damasus was the most distinguished pontiff of his century and left to posterity the fame of an enlightened and energetic reign. As to Jerome, Westcott does not exaggerate in saying that he was the one man in 15 centuries capable of the task he accomplished; without him, in all probability, Europe would have had to wait till the Renaissance for a translation comparable to the Vulgate. The history of his life is in great part the history of its production.

Saint Jerome (Eusebius Hieronymus, as he was called) was born of Christian parents at Stridon, on the borders of Dalmatia and Pannonia, now Szalad in Hungary, probably between 340 and 346 A.D. His father, Eusebius, a man of education and means, perceived the ability of the boy and sent him to Rome, at an early age, to complete his studies. There he awoke to the love of literature and, despite some aberrations, was strengthened in the love of religion—the two impulses which dominated his life and have left their impress on western Europe. Unconsciously, he was all along preparing himself for his great task, the translation of the Bible. He acquired a firm grasp of the Latin idiom, through his deep study of its literature, and laid the foundations of his subsequent thorough knowledge of Greek; at the same time, he was fostering that religious spirit which later caused him to devote himself to sacred rather than to secular studies. He was baptized in Rome about 366. Not long after, he removed to Trier, in Gaul, and later (370) to Aquileia in North Italy, where in the company of other young men of talent and piety, he vigorously pursued the study of theology. The company breaking up in 373, Jerome traveled in the East, visiting Greece, Asia Minor, and Syria. At Antioch, in Syria, a dream decided the work of his life: Christ, in an apparition, reproached him with being a Ciceronian and no Christian. Henceforth he gave himself to sacred studies and religious practices; in his old age, however, he was able to reconcile with them the reading and teaching of pagan literature. In the summer of 374, he retired to the desert of Chalcis, east of Antioch, where he spent five years in study and prayer. During this period, under the instruction of a Jewish rabbi, he made a diligent study of Hebrew; at this time, too, began his correspondence with Pope Damasus, which led later to such happy results. Jerome was ordained priest at Antioch, in 379, though he appears never to have exercised the functions of his office. In 380, we find him in Constantinople, the capital of the empire, where he fell under the spell of the winning and cultivated Saint Gregory Nazianzen. At length, in 381 or 382, he returned to Rome. He was soon admitted into the closest intimacy with Damasus, which lasted till the pope's death, in December 384. It was during this period (in 383) that Jerome, at the request of the pope, revised the Old Latin Version of the gospels and shortly after, of the remaining books of the New Testament. His Roman Psalter was also published about this time. Jerome had great popularity and influence at Rome under Damasus, and, nat-

urally, had made some enemies: their opposition increased after his patron's death and caused him to leave Rome forever, in August 385. He returned again to the East; his eager, inquisitive mind and his spirit of piety both impelled him to visit all the holy places of Palestine and to study its topography, cities, and traditions. Finally, in the autumn of 386, he settled at Bethlehem, near the cave of the Nativity, and built a monastery, over which he henceforth presided. In this retreat, during the last 34 years of his life, he "scorned delights and lived laborious days" of study, writing and meditation: their fruit was given to the world in his famous epistles, his commentaries and controversial writings, but above all in his translations of the Sacred Books. In his work on the Hebrew text, he was almost constantly assisted by learned rabbis. He died in 420.

Revisions of Old Latin Version.—New Testament.—Jerome's work as a reviser and translator began with the gospels (383). These books were the most important and familiar, and also, because of their wide circulation, the most corrupt in text. The task which Damasus committed to him, was not a new translation, but merely a revision of the familiar text. For this, Jerome collected and consulted the best Greek manuscripts he could find, and with their guidance, corrected the Latin wherever the sense required it. Shortly after the rest of the New Testament was corrected in the same way, though more slightly, it appears. All this work became part of the Vulgate: Jerome never made a fresh translation of the New as he did of the Old Testament.

Old Testament.—The Psalter, the prayer book of the Church in daily worship, was the first book retouched by Saint Jerome. In the course of his life, he published three editions of the Psalter; it will be convenient here, for clearness' sake, to speak of all three. The first or Roman Psalter, published at Rome in 383, was adopted there for public services and continued in use till the time of Pius V. (1566). For this revision, Jerome had recourse only to the Greek text. It never became part of the Vulgate and has gone out of use, except that the invitatory psalm (94) in the Breviary (q.v.) and the quotations from the Psalter in the Missal are taken from it. This revision itself becoming corrupt, through the errors of copyists, a second revision was called for. This, published at Bethlehem in 387, is the Gallican Psalter, so called, because it was adopted for public worship in the churches of Gaul. It was based likewise upon the Greek text, but is a more critical recension than its predecessor. It is now used throughout the Latin Church and has been incorporated in the Vulgate; yet it is not Jerome's best edition of the Psalter. This is conceded to be his third or Hebrew Psalter, a new translation made directly from the Hebrew (probably 392).

Other books of the Old Testament were revised by Jerome according to the Septuagint (q.v.): he himself mentions Job, Proverbs, Canticle of Canticles, and Chronicles by name, but it is believed, from his words, that he revised all the books of the Septuagint which are contained in the Hebrew Canon. All, however, have perished except Psalms, mentioned above, and Job.

Translations from the Hebrew.—Jerome's work as a reviser made him thoroughly acquainted with the great variations of the Septuagint text and threw him back, more and more, upon the Hebrew as the one standard. There, thanks to the watchfulness of the rabbis, he found instead of the confusing variety of the Septuagint an almost perfect agreement in the manuscripts. The controversy with the Jews, who taunted Christians with using a corrupt text, had great weight in determining Jerome to translate the Hebrew Bible. His friends, too, were repeatedly urging the task upon him, so he finally set about it, not following any set plan (he began with Samuel and ended with Esther), but translating such books as his friends requested. This translation, therefore, it appears, contrary to the impression of many, was not undertaken as an official work, destined for public services. He intended it primarily for the eyes of his friends and desired them, out of a fear of controversy, to keep it private. For about 15 years, from 390 to 405, he labored at this great task and succeeded in translating all the books of the Hebrew Canon (same as the Protestant Canon). Of the remaining books of the Old Testament, which are accepted as inspired by the Roman Catholic Church, he translated Tobias and Judith from the Aramaic, and from the Greek the passages of Daniel and Esther, which are not found in the Hebrew (Dan. iii. 24-90, xiii.-xiv.; Esther x. 4-xvi. 24). There is ground for believing that he translated or revised the books of Maccabees. Wisdom and Ecclesiasticus he left untouched, and passed over Baruch.

Reception of the New Translation.—Jerome's friends could not keep their good things to themselves; his translations, eagerly sought and copied, and soon widely circulated, raised a storm of opposition. The gospels, indeed, though sanctioned by the authority of Pope Damasus, had been bitterly attacked by many; but when his Old Testament was published and the extent of its variations from the Old Latin rendering of the Septuagint became known, Jerome found enemies in every quarter. The Septuagint was popularly regarded as an inspired translation, according to the well-known legend; to vary from it was to corrupt the word of God. So Jerome was sacrilegious and presumptuous in daring to correct the venerable text: he was disturbing the faith of the people. Even the great Augustine at first did not approve of his translation. Jerome defended himself with more than his usual warmth, especially against the charge of disrespect toward the Septuagint: for had not he spent years of his life rendering it faithfully into Latin? Gradually the storm subsided; part of his work won favor and public recognition; the bitter attacks were passed—he died in peace and was recognized as a Saint and Doctor of the Church.

Vulgate During the Middle Ages.—It was long centuries, however, before the translation of Jerome became the Vulgate or official version. Old memories and affections were entwined around the ancient text and the new was looked upon as an intruder; just as in our own day, the Revised Version has thus far made no advance in public favor. At Rome, Jerome had great prestige because of his many friends there, his reputation as a scholar, and the patronage

extended to him by Damasus. Many of the clergy admired and used his version, and the example of Rome was followed in different parts of Europe. The remote provinces, like Britain and Africa, clung to the old. In the 6th century we see the new translation current almost everywhere except in Africa; yet Pope Gregory the Great, who saw the beginning of the next century and died (604) just 200 years after Jerome had completed his translation, did not enforce its usage. His marked preference for it, however, turned the tide in its favor and it spread rapidly all over Europe. In the 9th century it was used throughout the church; yet it is a curious fact that the Old Latin survived till the 13th century wherever the heresy of the Albigenses prevailed, and even, in Bohemia, till the 15th century (Berger, p. 74).

Corruption.—The old Bible did not die without leaving traces of itself upon its successful rival. It must be remembered that in the early Middle Ages the Bible circulated, not in one volume, but in separate books: it easily happened, then, that a new manuscript was copied, according to the books at hand, partly from the old, partly from the new translation. Many readings of the Old Version, too, found their way into the new, particularly in the gospels and epistles, where the familiar text, dwelling in the memory of the scribe, displaced Jerome's corrected text. In the synoptic gospels, containing so many parallel passages, the text of one gospel was often substituted for the text of another. Occasionally, though not frequently, a phrase was altered to give clearer expression to a dogma. Other sources of error existed, but the chief of all was the perennial one—the carelessness of scribes.

Efforts to counteract this downward tendency were unceasingly made during the Middle Ages. Cassiodorus, Alcuin, Lanfranc, Stephen Harding, and many others are mentioned as strenuous laborers in this field. Roger Bacon, we are told, spent nearly 40 years correcting and explaining the sacred text. Schools even were established for the purpose of recovering, diffusing, and handing down to posterity the pure text of God's word. Often the supposed corrections were themselves mistakes; yet they were perpetuated in many manuscripts, with the chance of being accompanied by new errors in every new copy. Their importance, however, must not be exaggerated. The many manuscripts of the Vulgate which we inherited from the Middle Ages show, so far as they have been examined, that these mistakes are seldom serious from a dogmatic or devotional point of view. Only the printing press seemed capable of preventing their multiplication, for the scholars of that time, as White says, had used all the remedies that could be applied before the invention of printing.

Printed Vulgate.—The press, at first, did little toward the restoration of a pure text. The best texts, it is believed, were preserved in the most handsome manuscripts and these were too costly to be sent to the printing shop. Inferior texts were consequently the first printed and little criticism was applied to correct them. The famous Complutensian Bible made an attempt at a critical edition of the Vulgate, but its success was slight. Stephanus, a French Protestant, was somewhat more successful. The printing press was multiplying Bibles rapidly and

VULGATE

mistakes as well, it may be said. According to White, during the first half century following the invention of printing, in 1436, it is computed that 124 editions of the Vulgate were printed; another count, from 1471 to 1599, enumerates 179 editions.

These editions were not mere reproductions, one of another; many different manuscripts had been consulted and many editors were at work, each using his judgment (or his whim) in the correction and choice of texts. To add to the variety, several new Latin translations, by both Catholics and Protestants, were put forth.

Decree of the Council of Trent.—It is easy to see how bewildering must have been this immense variety of old and new translations. A standard text had become imperative. It was necessary, too, since the question of the Canon of Holy Scripture was debated, to determine which books should be included in the Catholic Bible. Accordingly, in 1546, the Council of Trent closed the Canon, accepting as sacred and canonical all those books which the tradition of the Church, and especially the Council of Florence, had declared to be inspired; moreover, the decree specified that they were accepted "as they were had in the Latin Vulgate." In the same year the Council ordered that the Vulgate be printed in as correct a text as possible and requested the Pope to carry out the measure. These two important points—the books included in the Vulgate and the text authorized by the Roman Catholic Church—call for separate and somewhat detailed treatment.

Books Included in Vulgate.—First, we give a list of the Vulgate books, in their proper order, according to the names which they bear in the Douai translation. These names, it will be seen, often differ from those of the Authorized Version; they are derived from the Septuagint through the Latin, while the Protestant names come in part from the same source and in part directly from the Hebrew. We subjoin the latter wherever the difference is notable. The books of the Old Testament are: Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Josue (Joshua), Judges, Ruth, I. and II. Kings (I. and II. Samuel), III. and IV. Kings (I. and II. Kings), I. and II. Paralipomenon (Chronicles), I. Esdras (Ezra), II. Esdras, or Nehemias, Tobias, Judith, Esther, Job, Psalms, Proverbs, Ecclesiastes, Canticle of Canticles (Song of Songs), Wisdom, Ecclesiasticus (Sirach), Isaias, Jeremias, Lamentations, Baruch, Ezechiel, Daniel, Osee (Hosea), Joel, Amos, Abdias (Obadiah), Jonas, Micheas (Micah), Nahum, Habacuc, Sophonias (Zephaniah), Aggeus (Haggai), Zacharias, Malachias, I. and II. Maccabees. In the New Testament, the books and their names are identical with those of the Authorized Version, except that the last book is called in the one Apocalypse and in the other Revelation. The Vulgate, as finally adopted by the Roman Catholic Church, is a mosaic: it is made up of direct translations from Hebrew, Aramaic, and Greek, of revisions of Old Latin, according to the Septuagint and the Greek New Testament, and, lastly, of Old Latin translations unrevised. (See *JEROME'S TRANSLATION FROM THE HEBREW.*)

Differences Between Roman Catholic and Protestant Bibles.—The foregoing list will have made clear the most striking difference between

the Vulgate and the ordinary Protestant Bible of to-day—the inclusion of Tobias, Judith, Wisdom, Ecclesiasticus, Baruch, and I. and II. Maccabees among the sacred books of the Bible on an equal footing with the rest. These books were formerly printed in Protestant Bibles, sometimes as integral parts of Scripture, sometimes with an undefined standing, more frequently as being unequal to the other books, but useful "for example of life and instruction of manners." With them may be classed the additions to Esther and Daniel, mentioned in the fifth topic. All these portions of the Vulgate are now generally excluded from English Protestant Bibles, but find a place in the Lutheran. They are still used in the public services of the Anglican Church. Subtract these books from the Vulgate list and the order of the books in the two Bibles will be found identical. Many minute differences, which cannot be noticed here, are found in the inner arrangement, but more particularly in the numbering of the contents of several books. Textual divergences, naturally, are the most numerous, but their extent and importance have been greatly exaggerated. The Canon remains the only really great difference.

Official Text of Vulgate.—The order of the Council of Trent, promulgated in 1546, that an official text of the Vulgate be printed, remained unfulfilled till the reign of Sixtus V. (1585-1590). The attempts of previous pontiffs had led to little result. Sixtus summoned a commission of cardinals and scholars and entrusted them with the work; not content with this, he applied himself vigorously to the task, with more energy than critical acumen and with no scrupulous deference to the opinions of the commission. The edition, called after him the Sixtine, was completed and published in 1590, a few months before the death of the Pope. It was soon found to contain numerous errors, and all copies of it were recalled two years later by Clement VIII., who published a new and more correct text (1592). The Clementine Vulgate has ever since remained the official Bible of the Roman Catholic Church.

Sixtus V. had prefixed a Bull to his edition, declaring that it must be held as "the true, lawful, authentic, and undoubted" version of the Scriptures; he forbade anyone, under penalty of excommunication, to print a different edition of the Vulgate. This prohibition was also contained in the Clementine Bull. The effect of it was to put an end to the intolerable confusion of texts; indirectly, too, it is generally believed to have impeded the recovery of the true text of Saint Jerome. Some writers, Catholic and Protestant, have tried to extract from these Bulls a dogma of textual accuracy; this position is stultified by the action of Pope Clement, who recalled the "authentic" version of Sixtus and published another "authentic" version, differing from the former, it is said, in 3,000 places. The popes consider matters of discipline, but not of dogma, as subject to rectification. The action of Clement merely constitutes his edition the official Bible of the Church and guarantees its general trustworthiness and its freedom from doctrinal or moral error. The Clementine Vulgate, claimed to be better than any predecessor, but not to be perfect; it will probably give way itself to a more perfect version when modern scholarship shall have arrived at assured results.

Value of Vulgate Text.—Modern scholarship, however, is far from having settled the exact text either of the Old or of the New Testament, and Jerome's version remains one of the best witnesses to the originals, though its value is not uniform throughout. His revision of the gospels, to quote Bishop Westcott, "represents the received Greek text of the 4th century, and so far claims a respect, speaking roughly, equal to that of a first-class Greek manuscript." Jerome, it should be remembered, sought out the best manuscripts of his day; the type of text he followed corresponds partly to that in greatest favor at present, partly to another now no longer known. His revision of the rest of the New Testament was not so thorough and probably let many inaccuracies remain; he himself in his commentary on the Galatians departs at times from the received Latin text.

In the Old Testament Jerome followed a text almost identical with the Massoretic, and, therefore, of the greatest value. His translation shows him to have been "a good, but by no means immaculate, Hebrew scholar." In general, his work was done with the greatest care and light was constantly sought from learned Jews. Tobias and Judith, however, in whose canonicity he did not believe, were translated hurriedly. Almost all scholars would agree with the judgment of White, who says, in summing up this matter: "We may confidently assert that the general standard of the translation is a very high one."

Literary Qualities.—The language of the Vulgate was based upon the common conversational Latin of its day, used by all classes of the people; it differed greatly from the literary Latin and contained many words and forms considered archaic or rude. Despite the flavor which this origin frequently gives to the language of the Vulgate, the translation is greatly admired for its simplicity, clearness, flexibility, force and majesty. In the poetical and prophetic books it is unsurpassed. These fine literary qualities may be attributed to the genius of Jerome; yet they are present also in books which he did not touch. The Latin language, indeed, seems peculiarly adapted to render Hebrew thought and feeling; thus the Vulgate has ever been a favorite with literary men who love both the Bible and the language of Cicero, especially in continental Europe.

English Translations of the Vulgate.—The first English translation of the entire Vulgate is commonly attributed to Wyclif (d. 1384). The second is the work of Roman Catholic scholars in exile, who published the New Testament at Rheims, in 1582, and the Old at Douai, in 1609. The Rheims-Douai Version has remained ever since the Bible of English-speaking Catholics; passing through numerous editions, it has lost much of its original roughness and Latin phraseology and approached more closely to the King James Version. Scholars acknowledge its "anxious fidelity," whether in praise or blame, as well as its very great influence upon the interpretations and vocabulary adopted by the Authorized Version.

Bibliography.—White's lengthy article, 'Vulgate,' in Hasting's 'Dictionary of the Bible' (to which we are particularly indebted); also in same Dictionary, article, 'Latin Versions,' by Burkitt; Westcott, on Vulgate, in Smith's D. B.;

Kenyon, 'Handbook to Textual Criticism of New Testament'; 'Our Bible and the Ancient Manuscripts,' by the same; Gigot, 'General Introduction to the Scriptures'; Berger, 'Histoire de la Vulgate pendant les premiers siècles du moyen âge.' In Vigoroux, 'Dict. de la Bible,' articles 'Jerome,' 'Latines Versions'; Kaulen, 'Geschichte der Vulg.' For fuller biography, see White; also for list of Vulgate manuscripts.

JOHN F. FENLON, S. S., D.D.,
Professor of Sacred Scripture and Hebrew,
St. Joseph's Seminary, Yonkers, N. Y.

Vulpus, vool'pē-oos, **Christian August**, German writer: b. Weimar, Germany, 23 Jan. 1762; d. there 25 June 1827. He was educated at Jena and at Erlangen, and under the direction of his brother-in-law, Goethe, he was later secretary of the court theatre at Weimar. He was appointed first librarian and overseer of the cabinet of coins in the library at Weimar in 1797, a position he occupied until his death. He wrote numerous plays, romances, etc., which were popular in their day, but are now scarcely remembered with the exception of 'Rinaldo Rinaldini, der Räuberhauptmann' (1797), which has been translated into various languages, and widely imitated. He also edited: 'Kuriositäten der physisch-litterarisch-artistisch-historischen Vor- und Mitwelt' (10 vols., 1810-23); and 'Die Vorzeit' (4 vols., 1817-21).

Vulture, any of various birds of prey which habitually feed on carrion. The vultures of the Old and New Worlds are quite distinct, the former constituting a family (*Cathartidae*) already sufficiently described under the articles CARRION-CROW, CONDOR and TURKEY-BUZZARD; while the latter are much more nearly related to the hawks and eagles (*Falconidae*), of which they are considered to be a subfamily (*Vulturinae*) or to form an allied family (*Vulturidae*). This group is distinguished by the possession of a strongly-hooked compressed bill; by short tarsi covered with reticulated or small polygonal scales. The middle toe is longer than the tarsus, and the hinder toe is a little elevated. The claws are blunt, but more or less hooked. The head and neck are frequently naked or covered with a light down. A large crop exists and the intestinal caeca and syrinx, wanting in the *Cathartidae*, are present. There are numerous other differences in skeletal and other parts. The cinereous vulture (*Vultur monachus*), is distinguished by the presence of a ruff of feathers, and by the crest borne on the back of the head. It inhabits Europe, Asia, and Africa, and is common. It may attain a length of three or four feet, and its color is a chocolate-brown with the naked head and neck blue. A long tuft of feathers springs from the base of the wings. The bird inhabits wooded situations as a rule, and appears to content itself with carrion, but rarely ventures to attack living animals. The nest is generally built in a tree.

The genus *Otogyph*, including the *O. calvus*, or Pondicherry vulture, and the *O. auricularis* or sociable vulture, is distinguished from the preceding genus by having a bare head and neck, with long wattles dependent from just below the head. The sociable vulture inhabits South Africa. It is colored a general blackish-brown, and its average length is four feet. The naked head and neck are light-red. The Pondi-

cherry vulture inhabits India, and is about three feet in length. Its head and neck are flesh-colored, and the chest bears a tuft of white feathers, the plumage generally being dark or blackish-brown. The genus *Gyps* is represented by the griffin or fulvous vulture (*G. fulvus*), and is distinguished by the bill being swollen or distended at the sides, the head and neck being covered with short down, and the neck possessing a ruff of long pointed or downy feathers. The griffin vulture inhabits Europe, Asia, and Africa. It attains a length of four feet, and is of a general yellowish-brown tint, the tail and wing quills being black, and the neck ruff white. The head is covered with white down. It is abundant about the Mediterranean countries, and builds its nest on cliffs. It is noted for its activity and great powers of flight. The Egyptian vulture (*Neophron percnopterus*) inhabits South Europe, Egypt, and Asia. It is white, the quill-feathers of the wings being dark brown or black, and the face, bill, and legs chiefly yellow. It is of small size and trim build. This bird is also known under the designations of "Pharaoh's chicken," and "white crow," and is protected by laws from being injured. Besides carrion it devours all kinds of refuse left by the larger vultures and small reptiles, insects, etc. In the weak bill and some other respects the Egyptian vulture somewhat approaches the *Cathartidae*. The celebrated lammergeier or bearded vulture (*Gypætus barbatus*), a genus and species distinguished from the preceding by the head and neck being feathered, and by the cere being concealed by bristly hairs, resembles the eagles in appearance and habits and is now generally considered as the representative of a subfamily (*Gypætinae*) of the *Falconidae*. (See LAMMERGEIER.) Consult: Dresser, 'Birds of Europe' (London 1881); and Blanford, 'Birds of British India' (London 1895).

Vyasa, vyā'sā ("the redactor or arranger"), the author, according to tradition, of the Vedas, the Mahabharata, the Puranas—of all ancient Sanskrit literature. It is evident that in this name is embodied the fact that these works have from time to time undergone recension. The name Homer has exactly the same meaning as Vyasa.

Vyatka, or **Viatka**, vē-āt'kā, Russia, (1) a town, capital of the government of same name, advantageously situated near its centre in a beautiful district at the confluence of the Klinovka with the Vyatka, 458 miles by rail west of Perm. Its houses are surrounded by gardens, and there are also public gardens. It has two cathedrals and also monasteries. There is steamer communication with Kazan. Pop. (1897) 24,894. (2) The government has an area of 59,329 square miles. The chief river is the Vyatka, which joins the Kama, a tributary of the Volga. There are low hills, especially in the north, and forests of fir, oak, elm, and birch are extensive. Flax and hemp are important crops, and among the chief minerals are iron and copper, which are extracted and smelted. There are manufactures of woolens, linens, potash, leather, firearms, anchors, gun-carriages, etc. Pop. (1897) 3,082,788.

Vyrn'wy, a river of Wales, rising in the northwest of Montgomeryshire, and after a circuitous course of some 35 miles falling into the Severn on the Shropshire border. Lake Vyrnwy, not far from its source, the chief reservoir of the Liverpool waterworks, completed in 1892, was formed by constructing a huge dam or embankment across the river valley, a former Glacial lake basin, the result being an artificial sheet of water about five miles long with an area of 1,121 acres and an available capacity exceeding 12,000 million gallons. The length of the embankment is 1,260 feet, its height 60, the length of the aqueduct to Liverpool 68 miles.

W

W the twenty-third letter of the English alphabet. It serves both as consonant and vowel; as consonant when it begins a word or syllable, and as vowel at the end of a word or syllable, where it forms a diphthong with a vowel preceding it, as in *how*, *grow*. Its sound is that of a voiced labial formed by rounding the lips as for pronouncing *oo*, then contracting the aperture so that the voice issues with some friction. W is silent in many words and positions; examples: *gunwale*, *sword*, *two*; *wrap*, *wrong*, *wright*. Words beginning with *wh*, are pronounced as though the aspirate preceded, as indeed it did in written Anglo-Saxon: thus *whety*, *what* are sounded *hwety*, *hwat*: but there is a tendency both in Britain and the United States to drop the aspirate in such words or to minimize it, so that *when*, *what*, *white* become *w'en*, *w'at*, *w'ite*: nor is this mispronunciation restricted to the vulgar; it may be heard in the speech of the cultivated class; but it is a vice of speech parallel to that of the lower-class Cockneys when they confound *v* with *w*, saying *vile* for *while* and *wile* for *vile*, *warden* for *warden*, and so on. W is silent in the words *who*, *whom*. W in *whole* and in *whoop* is intrusive, not existing in Anglo-Saxon *hal*, *hol*, nor in French *houper*. In German *w* is a consonant only and represents very nearly the sound of the English *v*, but is a little weaker: hence the English forename Edward is in German written *Eduard*. The consonant sound of *w* in the Gothic languages is generally replaced in the Latinish languages by *gu*; for example, *Walter*, *Gualtier*, *William*, *Guillaume*, *war*, *guerre*. The form (the letter *v* doubled) and the name of this consonant (double *u*) were both a true form and a right name when *w* first came into use. At that time—13th century—and long after the one character *v* (V) stood for the vowel sound *u* (*oo*), and its name was *oo*; at the same time it was used as the sign of the consonant now represented only by *v*: thus, while in form *w* is what it is called in French, *double vay*, or double *ve*, in sound it is for us what its name in English denotes, that of double *u*: See U:V.

Waagen, vā'gĕn, **Gustav Friedrich**, German art-historian: b. Hamburg, Germany, 11 Feb. 1794; d. Copenhagen, Denmark, 15 July 1868. He was educated at Breslau, Dresden, Heidelberg, and Munich, in 1830 was appointed director of the picture gallery at the Museum of Berlin, and he accepted the chair of history of art at the University of Berlin in 1844. His publications include: 'Kunstwerke und Künstler in England und Paris' (3 vols., 1837-9); 'Kunstwerke und Künstler in Deutschland'

(1843-5); 'Die Gemäldesammlung der kaiserlichen Eremitage in St. Petersburg' (1864); 'Die vornehmsten Kunstdenkmäler' (1866-7); etc.

Wahoo', or **Wahoo**, a small tree (*Ulmus alata*) of the southern United States, having small ovate, often falcate, leaves and spreading branches, which form an open, rounded head. The branches have wide, wing-like corky ridges, which have suggested the name winged elm. The tiny samaras are edged with a silky fringe. The tree, while growing naturally in damp places, is a valuable roadside shade-tree, where it is hardy. It has a chocolate-colored fine-grained, heart-wood, which has been used in the South for wheel-hubs.

The spindle-tree (q.v.) (*Euonymus americanus*) is also called wahoo.

Waal, wāl, Netherlands, the Dutch name for the lower course of the Rhine, which enters the country a few miles above Nimwegen, flows through the province of Gelderland, to its confluence at Gorinchem with the Meuse, and thence continues westward through a many-channelled delta to the North Sea.

Wabash, wā'bāsh, Ind., city, county-seat of Wabash County; on the Wabash River, and on the Cleveland, C. C. & St. L., and the Wabash R.R.'s; about 90 miles northeast of Indianapolis and 130 miles southeast of Chicago. It is in an agricultural and stock-raising region, but it has considerable manufacturing interests. In 1900 (government census) the city had 109 manufacturing establishments, with capital invested, \$2,430,502. The number of wage-earners was 1,241; and the average annual amount paid in wages was \$589,355. The cost of material used was \$1,206,726, and value of annual products was \$2,225,990. The chief manufactures are flour, paper, spokes, carriages, woolen goods, machine shop products, lumber products, shoes, and hats. There are railroad repair shops, lumber and coal yards. The principal public buildings are the Soldiers' Memorial Hall, Masonic Temple, Woman's Orphan Home, and the county court-house. There are three parks. The educational institutions are a high school, graded schools, Wabash City Library, and a high school library. There are four banks, three national and one private, having (1903) a combined capital of \$331,000, and deposits amounting to \$1,457,000. The first settlement was made in 1837 and the same year the town was incorporated. In 1866 it was chartered as a city. The government is administered under the charter of 1866, which provides for a mayor, who holds office two years, and a council. Pop. (1890) 5,105; (1900) 8,618.

Wabash, a river which has its rise in the western part of Ohio, flows northwest until it

WABASH COLLEGE — WACO

enters Indiana, where it takes an almost westerly course to Logansport, then flows southwest to Covington in Fountain County, then nearly south to the Ohio River. For about 120 miles of its lower course it forms the boundary between Indiana and Illinois. The total length is about 555 miles. It is the largest tributary of the Ohio, entering it from the north. The Wabash is navigable to Covington, about 300 miles, and when the water is high, to Lafayette. From Terre Haute to Huntington, the river is paralleled by the Wabash and Erie Canal which connects the river with Lake Erie.

Wabash College, located at Crawfordsville, Ind. It was established by four Presbyterian missionaries in 1832, was first opened to students in 1833, and obtained a charter from the legislature in 1834; the present site of the college was purchased in 1835. Though affiliated with the Presbyterian Church, the college is non-sectarian in control; the board of trustees number 21, of whom four are representatives of the alumni. Wabash is distinctively a small college aiming to give thorough college training, but not to do technical or university work. It is not co-educational, in which respect it stands almost alone among the colleges of the West and Middle West. Formerly the college conferred three degrees, A.B., B.Ph., and B.S., requiring a thorough course in Greek for the A.B. degree. All college courses now lead to the single degree of A.B. The course includes 104 hours of prescribed work, and 84 hours elective. Special courses are arranged by which technical and professional courses may be shortened in certain approved schools. There is a fellowship in English, a students' loan fund, and many prizes. A summer school under private control is conducted on the college grounds, work in which may count toward a degree. There is also a preparatory course. The college grounds contain 40 acres located in the heart of the city. On this campus are South Hall (occupied by the biological department and the museum), Center Hall, the gymnasium, Peck Scientific Hall, and Yandes Library Hall. The library in 1904 contained 38,000 volumes; the students numbered 224.

Wabasha, Minn., city, county-seat of Wabasha County; on the Mississippi River, and on the Chicago, Milwaukee & Saint Paul Railroad; about 30 miles northwest of Winona and about 100 miles southeast of Saint Paul. Lake Pepin, an expansion of the Mississippi, is about two miles above the city. Wabasha is in a fertile agricultural region, and has several manufacturing, chief of which are flour and oatmeal mills, foundry, machine shop, lumber mill, soap factory and a church furniture factory. The national bank has (1903) a capital of \$50,000 and deposits of \$250,000. Pop. (1890) 2,487; (1900) 2,528.

Wac'camaw, a tribe of North American Indians who, in the 18th century, lived on Wac'camaw River of eastern South Carolina. They are last mentioned in 1755, after which date, it is supposed, they became incorporated with the Catawbas. From their association, the Wac'camaws are believed to have belonged to the Siouan stock.

Waccamaw, a river which has its rise in the southeastern part of North Carolina, and is the outlet of Waccamaw Lake. It flows

south into South Carolina and joins the Great Pedee on the southern boundary of Horry County. Below the confluence of the rivers, the stream is often called Waccamaw. It enters the ocean through Winyah Bay. From the source of the Waccamaw to the Great Pedee is about 130 miles.

Wace, wās, an Anglo-Norman poet: b. Island of Jersey 1115; d. 1184. His Christian name is generally believed to have been Richard or Robert. He was patronized by Henry II. of England, who made him a canon of Bayeux, Normandy. Two important works by him remain, the 'Brut d'Angleterre,' and the 'Roman de Rou,' a history of Rollo and the dukes of Normandy, including the conquest of England.

Wace, wās, Henry, English Anglican clergyman: b. London 10 Dec. 1836. He was educated at Marlborough, Rugby, King's College, London, and Brasenose College, Oxford. He served curacies at Saint Luke's, Berwick Street, London 1861-3, and St. James', Piccadilly, 1863-9, and Grosvenor Chapel 1870-2, was chaplain of Lincoln's Inn 1872-80 and preacher there 1880-96. He was professor of ecclesiastical history in King's College 1875-83, in 1881 became a prebendary of St. Paul's, and in 1883 chaplain to the Archbishop of Canterbury and principal of King's College. He was Boyle lecturer ('Christianity and Morality') (1874-5) and Bampton lecturer ('The Foundations of Faith') (1879), but is best known as joint editor with Sir W. Smith of the great 'Dictionary of Christian Biography' (1877-87), and as himself the editor of the 'Speaker's Commentary on the Apocrypha' (1886).

Wachusett, wā-chū'sēt, Mount, an isolated peak in Worcester County, Mass., seven miles southwest of Fitchburg. The altitude is 2,018 feet, and the view from the summit, embracing a picturesque valley and several small bodies of water, is most beautiful.

Waco, wā'kō, a subtribe of the Wichitas (q.v.).

Waco, Texas, city, county-seat of McLennan County; on the Brazos River at the mouth of the Bosque, and on the San Antonio & A. P., the Missouri, K. & T., the Waco & N. E., the Saint Louis S. W., the International & G. N. the Houston & T. C., and the Texas C. R.R.'s; about 94 miles north by east of Austin and 85 miles south by west of Dallas. Waco is in a fertile agricultural region in which grain and cotton are the chief products.

Industries.—In 1900 (government census) the city had 166 manufacturing establishments representing 63 different industries. The capital invested in manufacturing plants was \$2,096,741; the number of wage-earners 1,227, and the average annual amount paid to wage-earners, \$469.129. The amount paid annually for raw material was \$1,477,642, and the value of the annual products was \$2,693,907. The chief manufactures were cotton products, printing plant products, men's clothing, wagons and carriages, watches, and foundry and machine shop products. The products of the saddlery and harness works were, for 1900, \$427,431, and ranked first in value among the industries of the city. Mineral and soda waters brought a combined revenue of \$77,433. Waco ranked seven among the cities of Texas in the value of manufactured products. The city is the principal inte-

rior cotton market of the State. In 1900-1901 it received and shipped over 210,000 bales. It is the great distributing centre between Austin and Dallas.

Municipal Improvements.—The city is well laid out, the streets are broad; over 60 miles are paved with asphalt, macadam, and gravel. The sewer system is excellent, over 100 miles of mains have been laid (1904). The waterworks are owned by the municipality, the purchase was made in 1903, and an issue of \$500,000 of bonds was effected, and the same were sold to pay for the water plant and works. There are a number of artesian wells, which have a medicinal value sufficient to attract many health seekers. A tubular-well system furnishes daily nearly 6,000,000 gallons of water. The city is surrounded by considerable prairie land which is used for park purposes, and there are three cemeteries. Waco is noted for its healthfulness, cool in summer, mild in winter; and with pure water and good sewerage, there are no opportunities for disease germs to flourish. Several bridges span the Brazos River, one a suspension bridge with 475 feet span. A cantilever bridge, for wagon traffic, built in 1901 by the city and county, cost nearly \$110,000.

Public Buildings.—The principal public buildings are the government building, county court-house, the churches, schools, banks, and some of the business blocks. The court-house, finished in 1903, is built of Texas limestone, and cost nearly \$300,000. The Masonic Order of Texas have decided (1904) to build here a Masonic Temple which will cost about \$250,000. The city has hospitals, sanatoriums, and an Orphans' Home.

Churches and Schools.—There are 47 churches, representing nearly all denominations. The educational institutions are four colleges: Baylor University (Bapt.), opened in 1845; Texas Christian University (Christian), opened in 1873; Saint Basil's College (R. C.), opened in 1900; Paul Quinn College (African Methodist Episcopal), opened in 1881. There are four institutions doing high school work: two public high schools, the central, for white pupils, and the high school for colored pupils. The Douglas-Schuler School (M. E. So.), and the Academy of the Sacred Heart are private schools doing high school and more advanced work. There are 13 ward public school buildings and one Roman Catholic parish school. Waco has two business colleges, which have a high standing, one city library (building cost about \$30,000), and several school libraries.

Banks and Finances.—Waco has four national banks, two savings banks, and one state bank, capitalized for nearly \$1,500,000. The municipal receipts and expenditures are over \$400,000. The chief items of expense are the schools and the interest on the bonded and floating debt.

Waco was surveyed as a town in 1849 and incorporated in 1850. Its growth in population has been steady and has more than kept pace with the growth in commerce. The rich surrounding country furnishes raw products sufficient for the support of a large manufacturing and commercial city. Pop. (1880) 7,295; (1890) 14,445; (1900) 20,686; (1904) est. 30,000.

ALLAN D. SANFORD,
Mayor.

Wad, a soft black mineral, consisting chiefly of the oxides of manganese, MnO_2 and MnO , but with varying percentages of one or more other metallic oxides and also water. Several prominent varieties and many minor varieties have been named, thus "bog manganese" contains iron, silica, alumina and baryta besides the usual much larger percentage of the manganese oxides and water. Asbolite or "earthy cobalt" contains oxide of cobalt up to 32 per cent. Lampadite contains from 4 to 18 per cent of oxide of copper. Wad frequently occurs in loosely aggregated masses which thus seem very light, but its specific gravity rarely falls below 3, and is sometimes as much as 4.26. Though usually so soft as to soil the fingers, its hardness may be as high as 6. Besides the common amorphous form, reniform masses and incrustations are frequently found, while beautiful arborescent infiltrations of wad occur in seams of quartz and other minerals (see Figure 12 under MINERALOGY). Wad and the closely related mineral psilomelane are important ores of manganese and occur abundantly in very many localities.

Wad. See GUNNERY.

Wadai, wā-di', or **Waday**, Northeast Africa, an extensive and semi-civilized negro state in Central Sudan, between Kanem and Bagirmi in the west and Darfur in the east, since 1899 recognized as within the French sphere of influence. With dependencies its area is estimated at 170,000 square miles and its population at about 5,000,000. It consists principally of an elevated plateau, very fertile in some parts, producing abundantly maize, millet, indigo, cotton, etc. Ivory and slaves are also largely dealt in. The inhabitants are warlike, and exercise tributary rights over several neighboring settlements; their aggressive policy was somewhat checked by the Mahdi who inflicted a crushing defeat on the sultan of Wadai's forces in November 1888. This sultan, Brahim, was deposed in 1901 and succeeded by the present ruler, Abugazali. The kingdom of Wadai dates from 1635. The prevailing religion is Mohammedan. Capital, Abeshe.

Waddell, wōd-dēl', **James Iredell**, American naval officer: b. Pittsboro, N. C., 13 July 1824; d. Annapolis, Md., 15 March 1886. He was appointed midshipman in the United States navy in 1841, became lieutenant in 1855, and in 1861 resigned his commission in order to join the Confederate navy the next year. He was engaged in the repulse of the Union forces at Drewry's Bluff, James River, Va., was sent to England by the Confederate government in 1863 and in 1864 took command of the Shenandoah, with which he began a piratical cruise against the commerce of the United States which lasted 13 months. He carried the Confederate flag around the world, captured 38 vessels and sailed under the Confederate flag for six months after Lee's surrender. He then turned his ship over to the British government which in turn transferred it to the hands of the United States consul at Liverpool. After residing for several years abroad Waddell returned to the United States and in 1875 became a commander in the service of the Pacific Mail Steamship Company.

Waddell, **John Alexander Low**, American engineer: b. Port Hope, Ontario, 15 Jan. 1854.

He was graduated from Rensselaer Polytechnic Institute in 1875, and in 1876-7 was engaged in engineering work on the Canadian Pacific Railway. He was assistant professor of rational and technical mechanics at the Rensselaer Institute in 1878-88, and in 1882-6 was professor of civil engineering at the Imperial University of Japan. Since 1887 he has been engaged as a consulting bridge engineer. He is a member of various American and foreign societies, and in 1888 was decorated by the Emperor of Japan, Knight Commander of the Order of the Rising Sun. He has published: 'Designing of Ordinary Iron Highway Bridges' (1884); 'A System of Iron Railway Bridges for Japan' (1886); 'De Pontibus' (1898); 'Specifications for Steel Bridges' (1900); etc.

Wadding, wōd'ing, Luke, Irish Franciscan friar: b. Waterford, Ireland, 16 Oct. 1588; d. Rome 18 Nov. 1657. After studying theology at the Lisbon Jesuit Seminary he entered the Franciscan Order in 1605, and became professor of divinity in the University of Salamanca. He went to Rome in 1618, where he founded the Irish Franciscan College of St. Isidore (1625), served as papal councillor in the controversy with the Jansenists, whose tenets he held at first, but presently renounced; and was procurator of his order (1630-4). He wrote 'Annales Ordinis Minorum' (1626-40; new ed. 24 vols. 1731-47); 'Scriptores Ordinis Minorum' (1660; new ed. 1806); and edited Calasio's posthumous 'Biblical Concordance' (1621) and the works of Duns Scotus (1620).

Waddington, wōd'ing-tōn, George, English educator: b. Tuxford, England, 7 Sept. 1793; d. Durham, England, 20 July 1869. He was educated at Trinity College, Cambridge, and received a fellowship there in 1818. He traveled in foreign countries for several years, was appointed commissary and official of prebend at Masham in 1833; was prebendary of Ferring, Chichester Cathedral in 1833-41; and from 1840 until his death was dean of Durham. His writings include: 'Journal of a Visit to Some Parts of Ethiopia' (1822); 'A Visit to Greece in 1823 and 1824' (1825); 'History of the Church from the Earliest Ages to the Reformation' (1833); 'History of the Reformation on the Continent' (1843); etc.

Waddington, Samuel, English poet: b. Boston Spa, Yorkshire, 9 Nov. 1844. He was educated at Brasenose College, Oxford, became a contributor to the leading English journals and reviews, and besides editing several anthologies, such as 'English Sonnets by Living Writers' (1881), and 'Sonnets of Europe' (1886), published also: 'A. H. Clough: A Monograph' (1883), 'Poems' (1896), and 'Collected Poems' (1902).

Waddington, Fr. vā-dān-tōn, William Henry, French statesman and diplomat: b. St. Remi-sur-l'Avre, Eure-et-Loir, 11 Dec. 1826; d. Paris 12 Jan. 1894. He was educated at Trinity College, Cambridge, England, for some years devoted his attention to archaeological research, was admitted in 1865 to the Académie des Inscriptions et Belles-Lettres, and did not enter politics until he stood unsuccessfully for the department of the Aisne in 1865 and 1869. Minister of public instruction in the extremely short-lived cabinet of Dufaure 19-24 May 1873, he was elected senator for the Aisne in 1876, and

was again minister of public instruction in 1876-7. In December 1877 he received the portfolio of foreign affairs, in 1878 took a distinguished part in the Congress of Berlin, and 4 Feb. 1879 became prime minister. His delay in the matter of needed reforms lost him the support of all parties, and he retired 27 December. He held the London embassy in 1883-93. His writings include editions of the edict of Diocletian (1864) and Le Bas' 'Voyage Archéologique' (1867-77); an essay on 'The Protestant Church in France' in 'Cambridge Essays' (1856), and 'Mélanges de Numismatique et de Philologie' (1861). Consult Mme. Waddington, 'Letters of a Diplomat's Wife' (1903).

Wade, wād, Benjamin Franklin, American lawyer and political leader: b. near West Springfield, Mass., 27 Oct. 1800; d. Jefferson, Ohio, 2 March 1878. In 1821 he went to Ohio, where after spending a few years in farming he took up the study of law, was admitted to the bar in 1827, and in 1831 formed a partnership with Joshua R. Giddings (q.v.), and built up a large practice. In 1837 he was elected to the State senate as a Whig, where he procured a resolution against the annexation of Texas; he also opposed the Kentucky Slave Bill, and on this account failed of re-election in 1839; but was again elected in 1841. He took active part in the campaign of 1840, and in 1847 was elected the presiding judge of the 3d Judicial Court of Ohio, where he acquired high standing as a jurist. In 1851 he was elected to the United States Senate, and re-elected in 1857 and in 1863, thus serving throughout the Civil War. He was a firm opponent of slavery, voted to repeal the Fugitive Slave Law, and in opposition to the Kansas-Nebraska Bill. After the election of Lincoln in 1860, he opposed any compromise between the North and the South; from 1861-2 was chairman of the joint committee on the conduct of the war, and advocated a vigorous policy and the immediate emancipation of the slaves. In 1864 he opposed the policy of the President and moderate Republicans in regard to Reconstruction, and with Senator Davis issued the Wade-Davis manifesto strongly criticising the President's policy. He was elected president *pro tem* of the Senate, and was thus acting vice-president of the United States in 1865, after Lincoln's assassination. His ability in debate, fearlessness, and honesty gave him a leading position in the Senate and commanded the respect of his associates. Consult Riddle, 'Life of Benjamin F. Wade' (1886).

Wade, Sir Thomas Francis, English diplomatist: b. London 25 Aug. 1818; d. Cambridge 31 July 1895. He studied at Trinity College, Cambridge; entered the army in 1838; in 1841 was promoted lieutenant in the 98th regiment, detailed for service in China; and was successively interpreter at Hong Kong and vice-consul at Shanghai. From 1861 to 1871 he was a member of the British legation at Peking, and from 1871 to 1883 ambassador there. In 1888 he was made the first professor of Chinese at Cambridge University. His large and important Chinese library is now in the possession of that institution. He published 'The Peking Syllabary' (1859); 'Yü-yen Tzū-erh Chi: A Progressive Course in Colloquial Chinese' (1867); and other standard works on China and the Chinese.

Wadelai, wā-dē-lī', Central Africa, a military post in the equatorial province of the Egyptian Sudan, on the Nile not far below the Albert Nyanza. It is famous as the chief station of Emin Pasha (q.v.), governor of the province, who, after the Mahdist rising, was cut off from civilization, and who was relieved by Stanley.

Wadesboro, wādz'būr-ō, N. C., town, county-seat of Anson County; on the Seaboard Air Line and the Atlantic Coast Line R.R.'s; about 120 miles southwest of Raleigh and 50 miles southeast of Charlotte. It is in an agricultural region in which the chief products are cotton and tobacco. The principal buildings are the county court-house, the Anson School Institute, opened in 1854, and the churches and schools for both races. The two banks, one national and one state, had (1903) a combined capital of \$75,000. The national bank had deposits amounting to \$180,000. Pop. (1890) 1,198; (1900) 1,546.

Wadham (wōd'am) College, Oxford University, England, was founded in 1610 by Dorothy, widow of Nicholas Wadham of Mayfield, Somersetshire, England, for a warden, 15 fellows, 15 scholars, two chaplains, and two clerks. One of the fellowships was diverted in 1857 to the endowment of the chair of experimental philosophy. The scholarships have an annual value of \$400, and are tenable for five years; and there are besides 10 Hody exhibitions (six Greek, four Hebrew) of \$250, two Wright exhibitions (1874) for scholars of Manchester grammar school, etc. Wadham College presents to 12 livings. The 17th century college buildings and the college garden are attractive features; the library is rich in rare Spanish books. Among Wadham's distinguished alumni are Admiral Blake and Sir Christopher Wren.

Wadi, wā'dē, or **Wady** (Arabian, "ravine"), in Palestine and Arabia, either a river or river valley, or the basin of a torrent. Renan thinks this word was adopted by the Greeks and corrupted into oasis. It has passed into the Spanish quād, with which many of the Spanish river names begin; thus Wadi-l-Kebir (Arab. "great river") appears as Guadalquivir, Wadi-l-hajarah ("river of stones") as Guadalaxara. The ravines of Malta commonly go by the name of vied or wied, a corrupted form of wadi.

Wadleigh, George Henry, American naval officer: b. New Hampshire 28 Sept. 1842. He was graduated from the United States Naval Academy in 1863 and was assigned to blockade duty with the West Gulf Squadron, serving until the close of the war. He was commissioned master in 1865, commander in 1880, served on the Arctic expedition in search of the Jeannette in 1881, was promoted captain in 1894, and in 1895-7 was in command of the Minneapolis on the coast of Asia Minor, engaged in the protection of American missionaries. He commanded the flag-ship Philadelphia in the Pacific station during the Spanish war, and after the conclusion of peace was in command of the Wabash at the Boston navy-yard. In 1902 he was promoted rear-admiral and was retired several months later in that year.

Wadlin, Horace Greely, American statistician: b. Wakefield, Mass., 2 Oct. 1851. He studied architecture in Salem and in Boston, Mass., and in 1875-9 was engaged in the practice of that profession in the latter city. He

was appointed special agent for the Massachusetts Bureau of Statistics of Labor in 1879 and upon becoming its chief in 1888 abandoned his professional practice. He resigned this position in 1903 to accept the post of librarian at the Boston Public Library, which he has since occupied. He was a member of the Massachusetts legislature in 1884-8, was supervisor of the United States census in 1890 and in 1900, and also of the Massachusetts census of 1895. He has published: 'Reports on Statistics of Labor of Massachusetts' (14 vols., 1888-1901); 'Annual Statistic of Manufactures of Massachusetts' (16 vols., 1888-1901); 'Decennial Census of Massachusetts' (7 vols., 1895); etc.

Wadsworth, wōds'werth, **James Samuel**, American soldier: b. Geneseo, N. Y., 30 Oct. 1807; d. 8 May 1864. He was educated at Hamilton College, Harvard, and Yale, though he was not graduated from any one of these institutions; studied law with Daniel Webster, and was admitted to the bar in 1833. He did not, however, practise his profession, his attention being given to the management of his extensive estates in western New York. He enlisted as a volunteer in the Union army early in 1861; was appointed a brigadier-general in August of that year; and became military governor of the District of Columbia in March 1862. In that year also he was the Republican candidate for governor of New York, but was defeated by his opponent, Horatio Seymour (q.v.). He was engaged in the battles of Fredericksburg, Chancellorsville, Gettysburg, and the Wilderness as commander of a division, and was mortally wounded in the last named battle, dying two days later.

Wadsworth, Ohio, village in Medina County; on the New York, Pennsylvania & Ohio Railroad; about 30 miles south of Cleveland and 15 miles west of Akron. It was settled in 1816, and in 1865 was incorporated. It is in an agricultural region in which tobacco is one of the important vegetable products. In the vicinity are large beds of coal, valuable sandstone quarries, and extensive deposits of fire-clay. There are also deposits of clay and ochre. The chief manufactures are door and window screens, wagons and carriages, steam injectors, flour, and machine shop products. There are eight churches, a normal school, graded public schools, and a library. There are two national banks which, in 1903, had a combined capital of \$75,000 and deposits amounting to \$396,020. Pop. (1890) 1,574; (1900) 1,764.

Wady-Halfa, wā'dē-hāl'fā, Egypt, the capital of a second-class district in the Sudan, on the east bank of the Nile, one mile below the second cataract, and at the junction of the branch lines of the military railroad to Khartum and Kerma. Its notable features are two ancient temples. Pop. with suburbs (1897) 2,675.

Wafer, (1) A thin circular cake of unleavened bread, generally stamped with the Christian monogram, the cross, or other sacred symbol, and used in the Roman and several other churches in the administration of the Eucharist. (2) A small disk of dried paste, used for sealing letters, etc.

Wager, a bet or something staked on the event of a contest or some unsettled question. The party whose opinion proves to be correct

WAGER POLICY — WAGNER

receives what has been staked by both. By statutes of England and the United States, all contracts or agreements, whether by parole or in writing, depending on wagers, are null and void, and money due thereon cannot be recovered in any court of law. A wager is therefore merely a debt of honor. See GAMBLING.

Wager, or Wagering, Policy, in insurance law, a pretended insurance, in which the insured possesses no legal interest in the subject-matter of the insurance or the risk insured against. Therefore it is really a wager between insurer and insured that the uncertain event referred to will or will not take place. The "stakes" of the insurer are represented by the sum insured; those of the insured, the paid premium. The insurer wagers that the contingent event will not take place; the insured, that it will. In England such policies came to be held as legal contracts, but they were finally abolished by statute. See INSURANCE.

Wages, the payment given for personal services, as contradistinguished from money received for anything sold: thus when an author publishes a book, or a shoemaker sells a pair of shoes, the sums received are not wages, although they are to the seller virtually the same thing. The term wages is now usually restricted to the money paid at short intervals for mechanical or muscular labor, the term salary being applied to the remuneration of the services of bank, railway, and other managers, overseers, and clerks, paid at longer intervals, as quarterly, half-yearly, etc.; and fee to money paid for the services of lawyers, doctors, paid at special times according to custom. As to the laws regulating the rise and fall of wages, see POLITICAL ECONOMY; also see UNIONISM.

Wag'ner, Arthur Lockwood, American soldier: b. Ottawa, Ill., 16 March 1853. He was graduated from West Point in 1875, was engaged in the campaigns of 1876-7 against the Sioux Indians, against the Utes in 1880-1, and in 1882-97 was engaged as an instructor of military science and tactics in different government schools. He received promotion to lieutenant-colonel in 1896 and until the outbreak of the Spanish war was in charge of the military information division of the War Department at Washington, D. C. He served on the staffs of Gens. Miles and Lawton successively during the Spanish war, and in 1899 was assigned to duty in the Philippines. He was engaged in the military operations in the province of Cavite and in 1900 was given command of the Department of Southern Luzon. Since 1902 he has been adjutant-general of the Department of Chicago. His publications include: 'The Campaign of Königsgrätz' (1889); 'Organization and Tactics' (1895); 'A Catechism of Outpost Duty' (1896); etc.

Wagner, vāg'nēr, Moritz, German naturalist: b. Baireuth 3 Oct. 1813; d. Munich 31 May 1887. He studied at Erlangen and Munich, and made extensive scientific journeys, in 1852-5 through North and Central America and the West Indies; in 1857-60 through the Andes from Panama to Ecuador. He was made professor of geography and ethnology at Munich. Among his writings are: 'Travels in the Regency of Algiers' (1841); 'The Caucasus and the Land of the Cossacks' (1847); 'Journey to Colchis' (1850); 'Journey to Ararat and the Armenian

Highlands' (1848); 'Travels in Persia and in the Land of the Kurds' (1851); 'Scientific Travels in Tropical America' (1870); 'The Darwinian Theory and the Law of Migration of Organisms' (1868).

Wagner, Richard, German composer, creator of the modern music drama: b. Leipsic 22 May 1813; d. Venice 13 Feb. 1883. His father, a clerk in the police court, who had been appointed chief of police by Marshal Davoust during the French occupation of Leipsic, died when Richard was only six months old; and the widow, left with seven children, married, nine months later, Ludwig Geyer, a well-known actor, playwright, and portrait painter, as well as a tenor. His appearances at the opera in Dresden, where he lived, gave young Richard opportunity to become familiar with the operas then in vogue, his favorite being Weber's 'Freischütz' which made a deep impression on him and determined the direction of his own genius to such a degree that it has been aptly said that it was Weber who wrote the first "Wagner Operas." When Geyer died, Richard was eight years old, and he had not, up to that time, shown any special talent for music; indeed, he played the piano so badly that his teacher told him he would never amount to anything. His poetic talent began to manifest itself when he was 11. Shakespeare became his model, and at 16 he had completed a tragedy, a sort of compound of Hamlet and Lear, in which he killed off so many of the characters (42) that most of them had to be brought back as ghosts to prevent the play from coming to an untimely end. It was his desire to set this to music that first decided him, at 16, to become a musician. He took some lessons, and after a few preliminary trials, wrote a piece concerning which he himself said afterward that "Beethoven's ninth symphony appeared like a simple Pleyel sonata by the side of this marvelously complicated overture." These youthful extravagances were prophetic of the man who was to revolutionize the opera by his bold defiance of all conventions. In 1830 he entered the University of Leipsic as a student of philology and esthetics; but music claimed most of his attention, and he wrote, among other things, a symphony which showed such a remarkable mastery of the methods of classical composition as to indicate that he could have become one of the great masters in the concert field had not the inclination of his genius taken him into the operatic domain. He wrote his first opera at Würzburg, where he had secured an engagement as chorus master; it was entitled 'The Fairies,' but was not performed till five years after his death, at Munich.

His second opera, 'Das Liebesverbot' (based on 'Measure for Measure'), had a deservedly unsuccessful production at Magdeburg. Then he accepted an appointment as conductor at Königsberg, where he married a pretty actress, Minna Planer; and in the following year he moved again, to the Russian town of Riga, where he wrote the libretto and the music of the first two acts of 'Rienzi.' This opera was planned on such a big scale that he knew he never could have it properly produced at a provincial theatre, wherefore he boldly resolved to go to the headquarters of spectacular opera—Paris—and try there to rival the popular idol, Meyerbeer, in his own field. With his wife and

Richard D. Wagner

WAGNER

a huge Newfoundland dog he embarked at Pillau for London; the voyage lasted nearly four weeks; three times the ship was tossed by violent storms, and it was during these that Wagner got the realistic "local color" for his 'Flying Dutchman,' the story of which was engaging his attention at the time. Paris did not prove hospitable to the German musician. He tried in vain to have one of his operas produced; no one cared for the French songs he wrote, and which he was finally glad to sell in Germany at \$4 apiece; he could not even get a place as chorus singer in a Boulevard theatre. Luckily he found a music publisher, Schlesinger, who paid him for proof-reading and arranging popular melodies and operatic scores for piano and cornet and other instruments. Wagner also wrote some interesting musical essays and novelties which were printed and paid for, and which contain many autobiographic details. He completed 'Rienzi' and also wrote the music of the 'Flying Dutchman'; but finally after nearly three years of starvation and numberless disappointments left Paris for Dresden, whence he had received a request for his 'Rienzi.'

With the return to Germany begins the second period in Wagner's life. 'Rienzi' was produced at Dresden on 20 Oct. 1842, and proved such a brilliant success that there was a demand for his other opera, 'The Flying Dutchman,' which was given on 2 Jan. 1843, only about ten weeks after 'Rienzi.' This proved to be less of a success; the performance was poor, and the audience was puzzled and displeased when, in place of the usual airs and processions it found an opera without arias, duos, and dances—an opera so new in form and spirit that few could understand it. Only four performances were given. However, 'Rienzi' had made Wagner the hero of the day; he was appointed royal conductor, and kept that position about six years. His next opera, 'Tannhäuser,' departed more widely still from the accepted models. It was produced on 19 Oct. 1845 and, to Wagner's chagrin, seemed to give pleasure only in so far as it resembled the old-fashioned operas. However, he persevered in his path of reform and wrote 'Lohengrin.' It was finished in 1848, but he could not even get it accepted for performance. Nor could he get any attention for his plans for reforming the Dresden Opera. He became more and more dissatisfied with his position, and when, in 1849, the revolution broke out, he foolishly joined the insurgents. The result was that he had to seek safety in flight; his companions were caught and imprisoned, while he succeeded in reaching Weimar, where Liszt took care of him and provided him with the means of escape to Switzerland. In that home of political refugees he dwelt during most of the years—more than a decade—that he was exiled from Germany. For six years he composed no more operas, devoting his time to writing essays on musical and dramatic subjects by way of explaining his theories. Little attention was paid to these, and he might have starved but for the assistance of Liszt and other friends. All this time the plans for his great 'Nibelung Tetralogy' were slowly maturing in his mind. In 1852 the poems were finished and printed and on 1 Nov. 1853, he began to write the music for 'Rheingold'; it was finished the following year and 'Die Walküre' was completed by March

1856. In the meantime he had unwisely accepted an offer to conduct a series of Philharmonic concerts in London (1855). Queen Victoria and the public were kind to him, but the press treated him shamefully, his music being described as an "inflated display of noise and extravagance," as void of melody, etc. He got only \$1,000 for four months' work. Returning to Switzerland, he finished 'Die Walküre' and began the third opera of the Nibelung Tetralogy, 'Siegfried.' When he had got to the middle of the second act, he despaired of ever finishing and producing this great cyclic work, and so abandoned it for the time being (in June 1857) and began his 'Tristan und Isolde,' which, being a separate work, would, he hoped, re-establish his connection with the stage. He completed it in 1859, but seven years elapsed before he succeeded in producing it. In 1860 he gave a series of concerts in Paris; they resulted in a large deficit. In the following year Napoleon ordered a performance of 'Tannhäuser.' Wagner was given to understand that he must introduce a ballet in the second act; he refused to do so, and the members of the Jockey Club took their revenge by creating such a disturbance that Wagner refused to allow more than three performances to be given. He thus received only \$150 for a year's hard work. Immediately after this disaster he wrote the poem for his only comic or humorous opera, 'Die Meistersinger,' of which he had made a sketch as early as 1845.

It was while composing this opera that the most important event of his life happened. He seldom had much money, but when he had he spent it with artistic lavishness, nor did he hesitate to live beyond his means. The failure, through no fault of his, of a Russian concert project, left him so deeply in debt in Vienna, that, to escape prison, he had to hide in Germany. On 3 May 1864, he was preparing to disappear in the Suabian Alps, there to complete his 'Meistersinger' score, when a message arrived from the new king of Bavaria, Ludwig II., who invited him to come to Munich to live there at his expense, to compose operas, and produce them. Wagner wept for joy, and promptly proceeded to Munich, where 'Tristan und Isolde' was produced on 10 June 1865, and 'Die Meistersinger' on 21 June 1868. But Wagner's enemies made life so unpleasant for him that he left Munich and took up his abode in a villa on Lake Lucerne, where, after completing his comic opera, he took up 'Siegfried' and finished that (1869). The fourth and last opera of the Tetralogy, 'Götterdämmerung,' was not completed till 1874. His plan of having a special theatre for the Tetralogy built in Munich, having failed, notwithstanding the king's friendship, he now chose Baireuth as the best place for such a theatre, in which his novel work could be presented in exact accordance with his intentions. To secure the large sum needed, Wagner societies were founded in the cities of Europe and America. In August 1876, three complete performances of the Tetralogy were given, before audiences including two emperors, a king, and many musical and other celebrities. But the deficit of \$37,000 discouraged a repetition of the festival. In 1882, however, after the completion of 'Parsifal,' another was held devoted entirely to that work; 20 performances were given in July and August. In the following February,

WAGNER—WAGRAM

Wagner died at Venice and his remains were taken in a special funeral train to Baireuth. After his death his widow (Cosima, the daughter of Liszt, whom he had married in 1870, four years after the death of his first wife) continued the festivals, which soon became enormously profitable. 'Parsifal' remained a Baireuth monopoly until 24 Dec. 1903, when Manager Conried produced it at the Metropolitan Opera House, New York, the receipts being over \$200,000 for 12 performances.

In personal appearance Wagner was barely of medium stature; his head was large in proportion to his body, his forehead massive, his chin prominent, his lips refined, his eyes keen, yet kindly in expression. His life was full of disappointments, which left their traces in the lines of his face. He was 44 years old before any of his operas were heard in Vienna, Munich or Stuttgart, and 56 before any of them were sung outside of Germany. This, of course, was largely due to the fact that he refused to make any concessions to popular taste, except in 'Rienzi.' The next three operas—'Flying Dutchman,' 'Tannhäuser,' and 'Lohengrin'—created an entirely new style, and by the time the public had become accustomed to that, he made another equally great step forward in his 'Tristan,' 'Meistersinger,' 'Nibelung Tetralogy,' and 'Parsifal.' These were derisively referred to as "music of the future," by way of burlesquing his idea of the "art work of the future." This idea was that music, sculpture, poetry, painting, and architecture had had their day as separate arts, and that the art work of the future was the music-drama, in which all these arts are united inseparably. His wonderful pictorial imagination is best exemplified in 'Parsifal.' Being almost as great a poet as he was a composer, he always wrote his own librettos, whose theatric and literary merits place him among the world's greatest playwrights, although they must not be judged apart from the music any more than the music must be judged apart from the plot, the scenery and the action. He preferred mythical, supernatural subjects to the historic. His operas are not, like those of his predecessors, a mere mosaic of unconnected arias, duos, choruses, and orchestral interludes, but, especially in those of the last period, every part is connected with every other part by means of leading motives, or characteristic musical phrases which are associated with a particular person, incident, or dramatic emotion, and which recur in the music whenever the person or dramatic idea with which they are associated recurs in the play. This practically gives the faculty of definite speech to the orchestra, the beauty and emotional power of which he further enhanced beyond all precedent by an endless variety of new tone colors and expressive harmonies. He also created an entirely new style of dramatic vocalism, which it took the singers years to master, but with which they are now celebrating their greatest triumphs; to-day Wagner's operas are more popular and profitable than any others. Apart from his operas, the list of Wagner's works includes some mediocre piano-forte pieces, several good songs, and, for orchestra, the 'Siegfried Idyll,' and three marches, the 'Huldigungsmarch,' the 'Kaisermarch,' and the 'Philadelphia Centennial.' This last, like his other miscellaneous works, is mediocre. His

literary works comprise ten volumes of dramatic poems and essays on musical and philosophical subjects, some of them wordy and wearisome, others extremely keen and suggestive; English version by Ellis, who is also translator of Glaserapp's monumental biography in 5 or 6 vols. The letters of Wagner to Liszt and other friends are extremely valuable; full use is made of them in the most elaborate biography in the English language, by Finck (1893). Other biographic and critical books are by Julien (1886), Tappert (1883), Muncker (1891), Liszt, Wolzogen (1883), Pohl, Nohl, Porges, Hueffer, Chamberlain (1892), Nietzsche, Schuré, Kufferath, Oesterlein, Dannreuther (in Grove), Henderson (1901), Krehbiel (1891), Kobbé, Newman, Weissheimer; thematic guides by Wolzogen, Kobbé, Heintz, Freda Winworth.

HENRY T. FINCK,

Musical Director New York 'Evening Post.'

Wagner, Rudolf, German physiologist: b. Baireuth, Bavaria, 30 July 1805; d. Göttingen, Germany, 13 May 1864. He was educated at Erlangen, Würzburg, and at Paris, was appointed professor of zoology at the University of Erlangen in 1833, and in 1840 was called to that chair at the University of Göttingen, where he remained until his death. He published: 'Lehrbuch der vergleichenden Anatomie' (2 vols., 1834-5); 'Handwörterbuch der Physiologie' (4 vols., 1842-3); 'Vorstudien zu einer wissenschaftlichen Morphologie des menschlichen Gehirns als Seelenorgans' (2 vols., 1860-2); etc.

Wagner, Siegfried, German musical conductor, son of Richard Wagner (q.v.): b. Lucerne, Switzerland, 6 June 1869. He was intended for an architect, but being bent on adopting the profession of his father, he left the Polytechnic school and studied music under Kniese and Humperdinck. He became a musical conductor in 1893, traveling in this capacity on the Continent and in England, and in 1896, and again in 1899, conducted the performances of 'Der Ring des Nibelungen' at Baireuth. He is the composer of the operas 'Der Bärenhäuser' to his own text (1899), and 'Herzog Wildfang' (1901); and various orchestral pieces.

Wagon, a four-wheeled vehicle for the transport of goods or passengers, drawn generally by horses. To enable the vehicle to turn as quickly and in as little space as possible, the fore pair of wheels are often made smaller than the hind pair, and to increase this advantage still further the axle of the fore-wheels is frequently fixed to the bottom of the vehicle by a swivel joint, in which case the shafts are attached to the fore-axle. The framework of the wagon is usually mounted on springs.

Wagram, vä'gräm, Austria, a village on the left bank of the Rossbach, 12 miles north-east of Vienna, famous for the great battle between the French under Napoleon and the Austrians under the Archduke Charles, on 5 and 6 July 1809. Napoleon had obtained reinforcements after the severe loss which he sustained at Aspern and Essling, and was able to throw an army of 150,000, with 550 cannon, across the Danube on 5 July. The Austrians, who occupied a strong position at Wagram, were immediately attacked, but the first day with little success. On the following morning the archduke fell upon the French centre under

WAGTAIL — WAHKIAKUM

Masséna, and then upon their left, producing confusion ending in total rout. A successful attack upon the Austrian left and centre by Davoust and MacDonald compelled the archduke to retreat, which he did leisurely and in good order, carrying with him about 7,000 prisoners, but leaving behind him 25,000 dead and wounded on the field, the French loss being probably about equal. On the 12th an armistice was signed at Znaim, and negotiations were commenced for a peace, which was concluded on the 14th October at Schönbrunn, and by which Austria ceded all her seacoast to France; Bavaria and Saxony were enlarged at her expense; part of Poland in Galicia was given to Russia, and Joseph Bonaparte was acknowledged king of Spain.

Wagtail, a small passerine bird of the family *Motacillidæ*, so called from the habit of jerking the long tails when running or perching. In this family, which also includes the pipits (*Anthus*) or titlarks (q.v.), the bill is slender, straight, and notched at the tip; the tarsi very long and slender for a passerine bird; the wing with nine primaries and elongated inner secondaries, and the tail long. About 100 species are known, most of them belonging to the Old World. North America has four species of pipits and three wagtails, one of which (*Budytes flavus*) is abundant in Alaska, the others (*Motacilla alba* and *M. ocularis*) are stragglers from Europe and Asia, respectively. The wagtails inhabit meadow-lands and pastures, and frequent pools and streams. They are agile runners, and have an easy, undulating flight. The food consists of insects, worms, snails, etc., especially such as may be found by wading. Their nests, built on the ground, contain from four to six eggs. A well-known European species is the pied wagtail (*Motacilla yarrellii*), a permanent resident in Great Britain. The white wagtail (*M. alba*) is common in France and southern Europe, is widely distributed in Asia, and occasionally wanders to Greenland; it resembles the preceding species, but is rather slender in form, and has the throat and part of the head and neck alone black, the general color of the upper parts being of a light ash gray. The blue-headed wagtail (*Budytes flavus*) is about 6½ inches long, yellowish green above, bright yellow below, the head bluish gray except for the yellow throat and white superciliary stripe. This species is distributed extensively over Europe and Asia, and breeds plentifully in Alaska. The nest is formed of roots and moss sometimes lined with feathers, and placed in a hollow on the ground. The name of water-wagtail, sometimes applied to the pied wagtail in England, is in the United States often given to the water-thrush (*Scirurus noveboracensis*), one of the warblers (q.v.).

Consult: Dresser, 'Birds of Europe'; Seebohm, 'Birds of Asia'; and the writings of Nelson, Turner, and Murdoch on the ornithology of Alaska.

Wah, the Nepalese name of the panda (q.v.).

Wahabees, wā-hā'bēz, **Wahabis**, or **Wahabites**, a Mohammedan sect, founded in Arabia about 1745 by Abd-el-Wahāb, a merchant as well as an oriental scholar of high attainments, who could not help observing the corruption both in doctrine and in practice

prevalent among the professed sons of Islam, especially the Turks. He deemed it his mission, not to teach a new religion, but to purge the innovations and errors which had crept into the old faith, and to restore the doctrines and observances to strict harmony with the teachings of the Koran and the Sunna. He inveighed against the idolatrous veneration for the Prophet and other saints, denying the intercession of saints altogether. He was an enemy to the gaudy decorations of the mosques and the rich dresses worn by the Turks, and strictly prohibited the use of tobacco. All who should oppose this reformation were to be destroyed by fire and sword. The first of Abd-el-Wahāb's important converts was the young and ardent chief Sa'ūd (or Saoud), who ruled over the little territory surrounding the fortified town of Derayah (or Dureeyeh), and who afterward became the son-in-law of the reformer. Abd-el-Aziz and Ibn Sa'ūd, the son and grandson of this chief, carried their arms to the utmost limits of the Arabian peninsula, subjugating and converting numerous tribes of Bedouins, and plundering the treasures of the mosques. The province of Nejed became the chief seat of their power, but Sa'ūd II. soon extended it over the greater part of Arabia, over which he administered justice in the manner of the caliphs. In 1803 he captured Mecca, and soon conquered Hejaz. The loss of the sacred city at last roused the Turks to action, and Mehemet Ali, pasha of Egypt, was appointed in 1804 to the task of crushing the fanatics. Nothing of importance, however, was done till 1812, when the Egyptians took Medina and drove the Wahabees out of Hejaz. In 1815 Ibrahim Pasha undertook an expedition to central Arabia to crush the power of the sect at once and forever; but it was not until 1818, after much hard fighting, that he fairly succeeded in dispersing the Wahabee forces and taking their capital, Derayah, which he laid in ruins. Abdalla, the son and successor of Sa'ūd, and some of his ministers, were made prisoners, and sent off to Constantinople, where they were executed. The Egyptians were not able to maintain the supremacy which they had acquired; gradually the Wahabees regained their influence in the centre of the peninsula; and soon after the death of Mehemet Ali, in 1849, the Egyptians gave up the struggle. Palgrave visited them in 1863, and Col. Pelly in 1865, and published the fact that the Wahabees, under the rule of Feysul, at once their emir (temporal ruler) and imaum (spiritual chief), extended their sway over a wider territory than ever before, and threatened to control by their arms and influence the whole peninsula. Since 1870, however, their power has been on the decline. Numerous fanatical Mohammedan bodies, evidently allied to the Wahabees, have settled in India, and by their turbulence and conspiracies have caused great uneasiness to the British government. Consult: Palgrave, 'Travels in Arabia'; Hunter, 'Our Indian Mussulmans' (1876); Burckhardt, 'Notes on the Bedouins and Wahabys' (1834).

Wahkiakum (the name of a former chief). A tribe of the Chinookan stock of North American Indians, formerly living near the mouth of Columbia River, in Washington. They were originally a part of the Chinook tribe, but sep-

WAHL — WAILATPUAN INDIANS

arated in the latter part of the 18th century, under Chief Wahkiakum, whose name they afterward assumed. They were first noted by Lewis and Clark. A county in southwestern Washington bears their name.

Wahl, William Henry, American scientist: b. Philadelphia, Pa., 14 Dec. 1848. He was graduated from Dickinson College, Carlisle, Pa., in 1867, studied at the University of Heidelberg, and subsequently made a special study of mineralogy, geology, and chemistry. He was professor of physics and physical geography at the Central High School at Philadelphia in 1873-4; resident secretary at the Franklin Institute; and editor of the 'Journal' of Franklin Institute in 1870-4, and in 1876 became editor of the Philadelphia 'Polytechnic.' He was associate editor of the 'Engineering and Mining Journal' in 1878-80, editor of the New York 'Manufacturer and Builder' in 1880-2 and then resumed his former post at the Franklin Institute, which he still holds. He has published 'Galvano-plastic Manipulations' (1883); 'Preparations of Metallic Alloys' (1893); 'Historical Sketch of the Franklin Institute' (1894); etc.

Wahoo, wā-hoo', Neb., city, county-seat of Saunders County; on Cottonwood Creek, and on the Chicago, B. & Q. and the Fremont, E. & M. V. R.R.'s; about 45 miles west of Omaha. It is in a fertile agricultural region in which the principal products are wheat and corn. The chief shipments are wheat, corn, and live-stock. There are 11 churches, a high school, elementary schools, and a public library. The Luther Academy, under the auspices of the Evangelical Lutheran Church, was chartered in 1883. The three banks, two national and one state, had, in 1903, a combined capital of \$150,000 and deposits amounting to \$545,960. Pop. (1890) 2,006; (1900) 2,100.

Wahoo. See WAAHOO.

Wahow'pum ("willow people"), a small tribe of the Shahaptian stock of North American Indians, occupying the village of Hahau on the north bank of Columbia River, near the mouth of Olive Creek, in Klickitat County, Washington. They have never been officially recognized.

Wahpekute ("shoot among deciduous trees"), a division of the Santee of the Dakota confederacy of the Siouan stock of North American Indians. They are now officially regarded as "Santees," of whom there are 1,300 under the Santee Agency, Nebraska.

Wahpeton, wā'pē-tūn (*Wa'qpe'tong-wong*, "dwellers among deciduous trees"). A division of the Dakota confederacy of the Siouan stock of North American Indians. Like the other Dakota tribes they lived largely by hunting and were noted warriors. There are now 1,030 Sissetons, "cut-heads," and Wahpetons under the Devils Lake agency, North Dakota, and 1,950 Sissetons and Wahpetons under the Sisseton agency, South Dakota, but the numbers of the individual tribes are not known. See McGee, 'The Siouan Indians,' 15th Rep. Bureau of American Ethnology, Washington, 1897.

Wahpeton, wā'pē-tōn, N. D., city, county-seat of Richland County; at the confluence of the Red River of the North and the Sioux Wood River, and on the Great Northern, the

Northern P., and the Chicago, M. & St. P. R.R.'s, opposite Breckenridge, Minn., and about 43 miles south of Fargo. It was settled in 1872 by M. T. Rich; became a village in 1881; and in 1884 was chartered as a city. The chief industrial establishments are flax fibre works, flour mills, machine shops, wagon factory, and lumber mills. It has grain elevators and lumber yards. The principal buildings are the county court-house, churches, and schools. There are eight churches. The educational institutions are the Red River Valley University, the State Academy of Science, the Lutheran Bible School, and public and parish schools. The three banks have a combined capital of \$160,000. The government is vested in a mayor and a council of six members elected biennially. About one half the population are Scandinavians, Germans, and Bohemians combined, the rest are American-born. Pop. (1890) 1,510; (1900) 2,228.

F. FALLEY,
Editor 'Globe.'

Wahsatch (wā'säch) **Mountains**, a range in Utah, the eastern boundary of the Great Basin, extending from the northern boundary of the State south nearly to the Colorado River. Several peaks are nearly 12,000 feet high; at the base and among the foot-hills are deep cañons. Silver in large quantities is found in these mountains. See also ROCKY MOUNTAINS; UTAH.

Waiam, wī'am (so called from their principal village), a small tribe of the Shahaptian stock of North American Indians, also known as Des Chutes, Wyams, etc. Their chief village was on the Columbia River, where Celilo now is. They took part in the Wasco treaty of 1855 and are now on Warm Spring Reservation, Oregon.

Wailatpuan (wī'ē-lāt'poo-an) **Indians** (Wai'lētpu, plural of Wai'let, "one Cayuse man"), a linguistic stock of North American Indians, consisting of the Cayuse and Molala tribes. The former originally occupied the mountain country on the heads of Wallawalla, Umatilla, and Grande Ronde rivers in Oregon and Washington; the Molala resided on Molala Creek, west of the Cascades in Oregon. The former tribe bore a high reputation for intelligence and bravery, but on account of their fighting propensities, which led them to make constant war against the Shoshoni and other tribes to the west, they were never very numerous. In 1838 a Presbyterian mission had been established among them by Dr. Marcus Whitman, at the site of the present Whitman, Washington. In 1847 smallpox carried off a large part of the tribe, and the Indians, believing the missionaries to be the cause of it, attacked and destroyed the mission on 27 November, and killed Whitman and 13 others. In 1854 the Cayuse numbered 126, of whom there were but few pure-bloods, the majority being intermixed with Nez Percés and Wallawallas. Of the 374 so-called Cayuse now on Umatilla Reservation, Oregon (which they share with the Umatillas and Wallawallas), only a few retain their own language. This reservation was set aside in 1855. There are perhaps two dozen survivors of the Molala tribe on Grande Ronde Reservation, Oregon. See Mooney, 'Ghost Dance Religion,' 14th Rep. Bur. Amer. Ethnology, Washington, 1891.

MORRISON REMICK WAITE.

CHIEF JUSTICE OF THE UNITED STATES SUPREME COURT, 1874-1888.

WAIKATO — WAITS

Waikato, wī'ka-tō, New Zealand, the principal river of North Island, flows first into Lake Taupo, and then out of it north to Manakau harbor on the west coast with a total course of 170 miles. Mercer, Hamilton, and Havelock, are the chief towns along its banks. Between the Upper Waikato, Lake Taupo, Mount Ruapehu, and the west coast lies the mountainous and picturesque "King Country," occupied mainly by Maoris under their king, who till 1884 resolutely opposed the survey or settlement by Europeans of the lands within their *aukati* or frontier.

Wainwright, wān'rit, **Thomas Griffiths**, English art critic and forger: b. Chiswick October 1794; d. Hobart Town, Tasmania, 1852. He studied art in London, wrote art critiques for the 'London Magazine,' on which Lamb, Hood, Cunningham, Hazlitt, and De Quincey were at the time (1820-3) collaborators, and exhibited at the Royal Academy in 1821-50. In 1826 he forged an order on the Bank of England for £2,250, in 1837 was sentenced at the Old Bailey to transportation for life to Van Diemen's Land (Tasmania). He was also believed to have been concerned in several poisoning cases, to obtain money. He appears as Varney in Bulwer's 'Lucretia,' and Dickens' 'Hunted Down' was based on his career.

Wainwright, wān'rit, **Jonathan Mayhew**, American Protestant Episcopal bishop: b. of American parents, Liverpool, England, 24 Feb. 1793; d. New York 21 Sept. 1854. He was graduated at Harvard College in 1812; studied theology and took holy orders; and was rector of Grace Church, New York, 1821-34. He was rector of Trinity Church, Boston, 1834-8, and assistant in charge of St. John's Chapel, New York, from the last named year till November 1852, when he was consecrated provisional bishop of New York. He was one of the founders of the University of New York, and was considered one of the most eloquent American pulpit orators of his time. His publications include: 'Sermons on Religious Education' (1829); 'Lessons on the Church' (1835); 'The Pathway and Abiding Places of Our Lord' (1851); 'The Land of Bondage' (1852); etc.

Wainwright, **Richard**, American naval officer: b. Washington, D. C., 17 Dec. 1849. He was graduated from the United States Naval Academy in 1868, was promoted lieutenant in 1873, lieutenant-commander in 1884, and was executive officer on board the battleship Maine at the time of her destruction in Havana Harbor in 1898. In the war which followed he was in command of the Gloucester and took part in the naval battle at Santiago 3 July 1898, in which he destroyed the Spanish torpedo boats Furor and Pluton. He was superintendent of the Naval Academy in 1900-2 and in 1903 was assigned to the command of the Newark.

Wait, **John Cassan**, American lawyer and civil engineer: b. Norwich, N. Y., 4 June 1860. He was graduated from Cornell as a civil engineer in 1882, and from the Harvard Law School in 1891. In 1887-94 he was instructor and assistant professor at Harvard and in 1896-7 was in charge of the New York State canal improvements. He was associate editor of the 'Railroad Gazette' in 1894-5, assistant corporation counsel for the city of New York in 1900-3, and has published: 'Car Builders'

Dictionary' (1895); 'Engineering and Architectural Jurisprudence' (1897); 'Law of Contracts' (1901); 'Poems of Industry and Labor'; 'Calendar of Invention and Discovery' (1903); etc.

Waite, wāt, **Morrison Remick**, American jurist, 7th chief justice of the United States: b. Lyme, Conn., 29 Nov. 1816; d. Washington, D. C., 23 March 1888. He was graduated from Yale in 1837; studied law, and in 1838 moved to Ohio, where he was admitted to the bar in 1839. He began the practice of his profession in Maumee City, later moving to Toledo. In politics he was at first an active and influential member of the Whig party, and was elected to the Ohio State legislature in 1849; later he took part in the organization of the Republican party; was an ardent supporter of Lincoln; and was nominated for Congress in 1862, but failed of election. His national reputation dates from the time of his appointment by President Grant as one of the counsel to represent the United States before the tribunal for the consideration of the Alabama claims at Geneva; associated with him were Caleb Cushing and William M. Evarts, the latter a college class-mate. His reply to Sir Roundell Palmer, establishing Great Britain's liability for permitting the Confederate cruisers to coal in British ports during the Civil War, was considered a model of legal argument in its clear, direct, and logical presentation of the law and facts. In 1873 he was chosen by both political parties as a delegate from his county to the convention for revising the State Constitution of Ohio, and was made president of that convention. In the same year he was appointed chief justice of the national Supreme Court, the appointment being approved by a unanimous vote of the Senate. Many of the most important subjects of adjudication came before the court during his term of office. Among them were the following: The constitutionality of the enforcement act; interpretation of the latest constitutional amendments; rights and powers of the State to control and regulate the charges of railroads; the polygamy cases; federal control over elections; power of the president to remove from office; power of States to prohibit the liquor traffic; repudiation of State debts and the true meaning of the 11th amendment; questions arising out of the violence of the Chicago anarchists, and the exclusion of the Chinese. His work was marked by the strictest attention to detail, and by a rigid enforcement of the rules and precedents of practice of the court; it was his custom to keep watch of the docket and acquaint himself in advance with the character of the cases about to be reached. In all questions his decisions were entirely uninfluenced by political considerations; and all parties and sections united in commending his absolute fairness. A prominent lawyer of the South said of him: "He could hold in his steady and equal hand the balance of justice undisturbed."

Waits, the name formerly given in England and other countries to the king's minstrels, whose duty it was to guard the streets at night and proclaim the hour. The name was afterward applied to the town's musicians, who, however, did not perform the duties of watchmen; and to private bands, when employed as serenaders. At present the waits are musicians who play during the night hours on the approach

WAKASHAN INDIANS — WAKE FOREST COLLEGE

of the Christmas or New Year seasons, and call at the houses of the inhabitants for donations. While this custom exists to some extent in the United States, the term "waits" is not used here.

Wakashan (wă'ka-shăn) **Indians** (from *Waukash*, the Nootka word "good," which, when heard by Capt. Cook, was supposed to be the tribal name), a linguistic stock of North American Indians, consisting of the Aht and Haeltzuk divisions with their numerous tribes, occupying the northern half and the western part of the southern half of Vancouver Island, the opposite mainland of British Columbia, and a small area about Cape Flattery inhabited by the Makah, one of the Aht tribes. The stock has also been referred to as Nootka and Nootka-Columbian, the term Nootka being the first name applied to the Mowachat, an Aht tribe. Of the Aht division there are some twenty tribes, numbering in all about 3,100 individuals, of whom there are 414 Makah under the Neah Bay Agency, Washington, the remaining tribes being under the West Coast Agency of British Columbia. The 17 Haeltzuk tribes number in all about 2,500 souls, of whom about 1,900 are under the Kwawkweweth Agency, British Columbia.

Wakatipu, wă-ka-tē'poo, New Zealand, a picturesque lake in the South Island with an area of 112 acres. Queenstown and Glenorchy, on the borders of the lake, are favorite tourist resorts, on account of the magnificent mountain scenery in the vicinity.

Wakayama, wă'kā-yă'mă, Japan, a town on the island of Honshu, situated on the east coast of the channel leading into the eastern end of the Inland Sea, 35 miles by rail southwest of Osaka. It is an important centre of the cotton industry. Its noted features are the princely Kishu palace, and the beautiful temple of Kijimijdera said to have been founded in 770 A.D. Pop. (1898) 63,667.

Wake, Charles Staniland, American anthropologist; b. England 22 March 1835. He was educated at Hull College, England, has been prominently connected with various English and American anthropological societies, originated a system of color and musical-tone relations and is at present connected with the Field Columbian Museum in Chicago. He has written: 'Chapters on Man' (1862); 'The Evolution of Morality' (1878); 'The Origin and Significance of the Great Pyramid' (1882); 'The Development of Kinship and Marriage' (1889); 'Serpent Worship and Other Essays' (1885); 'The Geometry of Science' (1899).

Wake, William, English prelate; b. Blandford, Dorsetshire, 26 Jan. 1657; d. Lambeth 24 Jan. 1737. He was graduated from Oxford, took orders in the Anglican Church in 1676, and in 1688 he became preacher at Gray's Inn. In 1689 he was appointed chaplain in ordinary to William and Mary, and also received a canonry of Christ Church, Oxford. From 1693 to 1706 he was rector of Saint James', Westminster, became canon residentiary and dean of Exeter in 1703, from 1705 to 1716 he was bishop of Lincoln. In 1716 he was enthroned archbishop of Canterbury. He took part in negotiations during 1717-20 for the union of the Anglican and the Gallican churches, and in his

relations with Nonconformists showed a liberal spirit. His chief works are: 'The State of the Church and Clergy of England in their Councils, Synods, Convocations, Conventions, and their other Assemblies, historically deduced' (1703); 'The Genuine Epistles of the Apostolical Fathers' (1693); and 'Principles of the Christian Religion in a Commentary on the Church Catechism.'

Wake, a term corresponding originally to *vigil*, and applied to an annual festival held on the anniversary of the day on which the parish church was consecrated and dedicated to a saint, the celebration being begun on the preceding day (the eve or vigil). On the eve of the anniversary the parishioners attended service in the church, the floor of which was strewn with flowers and rushes, and the altar and pulpit were decorated with boughs. Tents were planted in the church-yard to supply the people from surrounding parishes who crowded in on the morrow, that day being observed as a holiday. They soon degenerated into mere country fairs, and were long characterized by wild riot and licentiousness. Statutes were at various times directed against holding markets in churchyards and showing all goods except necessary refreshments on the great church festivals, but they seem to have been little regarded. Country wakes on some saints' festivals are still kept up in certain English parishes.

A *lyke* or *liche wake* (Anglo-Saxon, *lic*, a corpse) is the watching of a dead body by night by the relatives and friends of the deceased. The custom arose no doubt from the dread of remaining alone all night in the presence of the dead or from the fear that malignant spirits would interfere with the corpse. The practice, once general, is now confined in the United States, to a part of the foreign element, and is on the decline with them. Wakes are sometimes attended by scenes of disorder and intoxication, but as a rule they are conducted with decency, and show sincere respect for the dead.

Wake Forest College, located at Wake Forest, N. C., 16 miles northeast of Raleigh. It was chartered in 1833 as the Wake Forest Institute, under the auspices and control of the Baptists of the State; it was first opened to students in 1834, and in 1838 the charter was amended, its privileges enlarged, and the name changed to Wake Forest College. The greater part of the endowment was lost during the Civil War, but the college continued its work and regained its financial prosperity. The system of independent "schools" is now an established feature of the college organization; these schools are 15 in number, as follows: Latin, Greek, English, modern languages, mathematics, astronomy, chemistry, biology, physics, moral philosophy, history and political science, the Bible, pedagogy, law, and medicine. There are preparatory courses offered in Latin, Greek, mathematics and English. The college confers the degree of A.B., B.S., LL.B., and A.M. (for graduate work). In the A.B. and B.S. courses a part of the work is elective, the electives being somewhat limited, however, in accordance with the degree to be obtained. For the degree of LL.B. the full course in the School of Law must be completed, also the course in the School of History and Political Science. Students are admitted to the School of Medicine, either as

WAKE ISLAND — WAKEFIELD

medical students or as undergraduates, if taking the B. S. course. The completion of the course admits to the third year of any good medical school. With the aim of encouraging ministerial education, it has been the custom of the college to organize a special class, studying different phases of pastoral work or theology; this is outside the regular work of the School of the Bible, and does not count toward a degree; a pastors' course of one month was inaugurated in 1902 for those pastors who could obtain a month's leave of absence from their churches. The college has a pleasing location on high ground; its buildings include the main building, the Ileck and Williams Building (library), the Wingate Memorial Building (chapel and audience hall), the Lea Laboratory (chemistry) and the Gymnasium. The endowment in 1904 was over \$200,000; the library contained 15,800 volumes, the students numbered 305, and the faculty 17.

Wake Island, an islet of rock in the Pacific Ocean, lying 1,550 miles northeast of Guam, and 3,000 miles east of the eastern coast of Luzon, Philippines. It belongs to the United States as a Pacific outpost of the Philippine Archipelago. It is about one square mile in area, and its importance is due to the fact that it is on the cable route between the United States and the Philippines.

Wakefield, Edward Gibbon, English colonial statesman: b. London 20 March 1796; d. Wellington, New Zealand, 16 May 1862. Educated at Westminster School and Edinburgh High School, he became associated in a subordinate capacity with the legations at Turin and Paris. About 1826 he turned his attention to colonial affairs and worked out the scheme of colonization usually known by his name. Its cardinal features were the abolition of free grants of land for agricultural purposes (then so readily obtained that none cared to remain dependent, and laborers were at once transformed into landed proprietors); and the careful control of emigration. His views were first publicly expressed in 'A Letter from Sydney' (1820). The National Colonization Society was founded in 1830 to carry out his ideas, and in the following year his plan was adopted by the government for New South Wales. The South Australian Association was formed in 1834, and included many eminent men, and under its auspices the colony of South Australia was founded in 1836 on Wakefield's principles. He accompanied Governor-General Lord Durham to Canada in 1838 as adviser, and had an important share in drawing up the report in which Durham embodied his proposals for settling the Canadian difficulty. Wakefield was the moving spirit behind the New Zealand Association of 1837, which forced the British government to annex New Zealand. He was subsequently a prime mover in founding the Anglican settlement in New Zealand, and in 1852 he went to New Zealand and plunged into colonial politics. After the breakdown of his health in 1854 he lived in retirement till his death. All subsequent English colonial development has followed the ideas formulated by Wakefield. He was equally able as a theorist and a director of practical details. Consult: Rusden, 'History of New Zealand' (1883); Gisborne, 'New Zealand Rulers and Statesmen' (1892); Garnett,

'Life' in 'Builders of Greater Britain' series (1898).

Wakefield, Gilbert, English clergyman and controversialist: b. Nottingham 22 Feb. 1756; d. London 9 Sept. 1801. He was educated at Cambridge, took orders, but renounced the Anglican communion after holding two curacies, was classical tutor in nonconformist academies at Warrington (1779-83), and Hackney (1790-1). He was imprisoned two years in Dorchester jail for a so-called seditious libel in answer to Bishop Watson, for which his political friends consoled him with a gift of £5,000. He published editions of Bion and Moschus, Vergil, Horace, and Lucretius; 'Christian Writers of the First Three Centuries on the Person of Christ' (1784), left unfinished; 'Inquiry into the Expediency and Propriety of Social Worship' (1791), the necessity for which he denied; 'An Examination of Paine's Age of Reason' (1794); 'Silvia Critica,' a collection intended to illustrate the Scriptures from the stores of profane learning (1789-95). He was a man of wide learning, but although very amiable in ordinary life extremely bitter as a controversialist. After leaving the Church of England he never attached himself to any other religious society, although practically a Unitarian. Consult his autobiography, entitled 'Memoirs' (1792).

Wakefield, England, an episcopal city, in Yorkshire (West Riding), on the river Calder, nine miles south by east of Leeds. The cathedral of All Saints, founded 1329, is mainly in the Perpendicular style, with a lofty tower and spire, though including work of earlier and later dates. Saint Mary's Chantry, on the ancient bridge across the river, is a decorated structure of the time of Edward III., restored in 1847. Besides several other places of worship, the chief buildings and institutions of the town include: the town-hall, a fine building in French Renaissance style; a large corn-exchange; a market-house and an industrial and fine art institution (1890), containing a museum, laboratory, and lecture-room. The industrial establishments comprise woolen-mills, soap and artificial-manure works, iron-foundries, boiler-works, agricultural implement manufactories, wire-rope works, machine-works, corn-mills, malting-works, breweries, etc. There are many collieries near the town, and market-gardening is carried on in the vicinity. The trade, especially in corn, is very extensive, and is facilitated by railway connections as well as by the river Calder and canals. Wakefield is mentioned in 'Domesday Book.' It was the scene of a Yorkist defeat in the Wars of the Roses on 31 Dec. 1460. In 1888 it was made the seat of a bishopric, formed mostly out of the diocese of Ripon. Pop. (1901) 41,189.

Wakefield, Mass., town in Middlesex County; on the Boston & Maine Railroad; about nine miles north of Boston. It is surrounded by farms, and it has several manufactories, chief of which are iron and brass foundries, piano factory, rattan goods works, shoe factory, flour mill, and machine-shops. In 1900 (government census) Wakefield had 97 manufacturing establishments, capitalized for \$3,209,070. The raw material used each year cost \$1,354,253, and the value of the annual products was \$2,058,656. The town contains the villages of Greenwood, Montrose, and Wakefield, in each of which are graded schools. There is one high school and

a public library containing about 15,000 volumes. There are two banks: the national bank has a capital of \$100,000 and \$444,270 in deposits; the savings bank has (1903) deposits amounting to \$1,053,320. Pop. (1890) 6,982; (1900) 9,290.

Wakefield, R. I., village in Washington County; at the head of Point Judith Inlet, an arm of the Atlantic Ocean, and on the Narragansett Pier Railroad; about 30 miles south by west of Providence. It is in a part of the State devoted to farming and market-gardening. The village has cotton and woolen mills, and several small industries. It has a savings bank and a trust company. Pop. (1890) 2,200. In 1900 the population was included with that of South Kingston town, which had a total of 4,972.

Wake'man, Henry Offley, English historian: b. near Worcester 25 Sept. 1852; d. Basel, Switzerland, 27 April 1899. He was educated at Christ Church, Oxford, was a fellow of All Souls from 1877 to his death, and was admitted a barrister of the Inner Temple in 1877. His publications are: 'The History of Religion in England' (1885); 'What Has Christianity Done for England?' (1886); 'The Church, and the Puritans, 1570-1660' (1887); 'Europe, 1598-1715' (1894); 'Introduction to the History of the Church of England from the Earliest Time to the Present Day' (1896; 5th ed. 1898); and an edition (with Hassall) of a volume of 'Essays Introductory to the Study of English Constitutional History' (1887).

Wakeman, Thaddeus Burr, American philosopher: b. Greenfield Hill, Conn., 23 Dec. 1834. He was graduated from Princeton in 1854, and was admitted to the bar in 1856. He has translated Goethe's religious poems, and has made a specialty of the study of positive philosophy. He is president of the Liberal University of Kansas City, and has published: 'An Epitome of Positive Philosophy'; 'Liberty and Purity' (1881); 'Evolution or Creation'; etc.

Wake'manites, certain fanatics who were supposed to be harmless until they committed a murder at New Haven, Conn., in 1855. Their leader was an old woman named Rhoda Wakeman, supposed to have been insane. Her followers obeyed her as a prophetess and believed she had been raised from the dead. At her bidding they murdered a farmer, Justus Matthews, who, she said, was possessed by an evil spirit. The unfortunate man willingly submitted to the sentence pronounced by the old woman, but the authorities prevented further tragedies by taking prompt action against all concerned in the crime, and the sect became extinct.

Walam Olum, otherwise known as the "Red Score" of the Lenni Lenapé or Delaware Indians, and supposed to be a record of the migrations of the tribe. The word "Olum" signifies a record, and "Walam," painted. Red is the color used. "Olum" was commonly applied to a notched stick, an engraved piece of wood or bark; but it is not unlikely that the engraved stone gorgets, notched along all their edges, or partly so, are to be included as records. The notching is too inconspicuous to be considered as ornamentation, but is so cleanly cut and defined that some serious purpose was evidently in mind in making it. The historic

"Walam Olum," for which we are indebted to Rafinesque, is declared by Antony, a Delaware Indian, to be a genuine composition of a member of that tribe. This composition, or record of events during the wanderings of the people, is asserted by Brinton to be "not of foreign origin, but wholly within the cycle of the most ancient legends of that stock"—the Algonkin. If read aright, it is a record of wanderings from the Labrador region southward and westward, and again eastward to the Atlantic coast of the middle United States. As a record of a migration that was possibly more extensive and fateful to these people than any one other of which they had knowledge, too much value has been placed upon it. Those ethnologists who have strongly leaned to the extreme modernity of man in America have thought they found evidence therein that the whole Atlantic seaboard, and for many leagues inland, was uninhabited and had so remained for all time until this wandering, described in the Walam Olum, took place. This conclusion does not seem to be supported by the results of geological research. Entirely too much has been made also of the assumption that the migration of the Lenni Lenapé, supposedly described in the "Walam Olum," was their only one.

Walcheren, vāl'hēr'ën, Netherlands, an island in the province of Zeeland, at the mouth of the Scheldt, forming an irregularly-shaped circle about 11 miles in diameter. It is well wooded and has fertile meadow lands, yielding corn and other crops in great plenty. Fruit is abundant. It contains the towns of Flushing, Middleburg (the capital), and Veere. It is protected from the sea by strong dikes. The island is noted for the Walcheren expedition of 1809, one of the most complete failures in British military history. The second Earl of Chatham, eldest son of the great Chatham, was despatched to the island in command of a force of about 40,000 for the purpose of capturing Antwerp and destroying Napoleon's arsenals on the Scheldt. Instead, however, of pressing forward against Antwerp, he persisted in the siege of Flushing, which was not captured before the greater port had been reinforced and strongly fortified by the French. Chatham returned to England with the bulk of his force, leaving a garrison of 15,000 on the island of Walcheren. The garrison was attacked by marsh fever and other diseases, about one half dying, and over half of the remainder being permanently disabled. Orders were then received from the government to destroy Flushing and return home.

Walckenaër, vāl-kē-när', Charles Athanase, BARON, French savant and author: b. Paris 25 Dec. 1771; d. there 27 April 1852. At 17 he went to study at Glasgow and Oxford; served as director of transportation in the army of the Pyrénées in 1793; became mayor of Paris in 1816, and prefect of the department of Nièvre in 1824 and of Aisne in 1826. In 1830 he finally left the public service, and in 1840 he became perpetual secretary to the Academy of Inscriptions. He was a voluminous writer on very many subjects. His first publication was an 'Essai sur l'histoire de l'espèce humaine' (1798), and in 1802 he published an 'Histoire abrégée des insectes des environs de Paris' and in 1805 a 'Tableau des aranéides,' an important

WALCOTT — WALDEMAR

contribution to entomology. Among his remaining works may be cited: 'Le monde maritime' (1819); 'Nouvelle collection des relations des voyages' (21 vols., 1826-31); 'Analyse géographique des itinéraires des anciens' (1839); 'Histoire de la vie et des poésies d'Horace' (1840); 'Mémoires sur Madame de Sévigné' (1842-52), which he left incomplete.

Walcott, wŏl'kót, **Charles Doolittle**, American geologist: b. New York Mills, N. Y., 31 March 1850. He made a special study of geology, and in 1876 became assistant State geologist of New York. He was appointed to a like office in the United States geological survey in 1879, became palaeontologist in 1883, chief palaeontologist in 1891 and in 1893 was appointed geologist in charge of geology and palaeontology, assuming the office of director of the geological survey in 1894. He was acting assistant secretary of the Smithsonian Institution in 1897-8, and in 1902 was elected chairman of the board of trustees for the National University founded by Andrew Carnegie. He has made a specialty of Cambrian researches and in 1888 laid the results of his labors before the International Geological Congress in London. In addition to numerous reports his writings include: 'The Trilobite' (1881); 'The Cambrian Faunas of North America' (1885); 'The Taconic System of Emmons' (1888); 'The Fauna of the Lower Cambrian or Olenellus Zone' (1890); 'Correlation Papers, Cambrian' (1891) etc.

Waldeck, vâl'dék or wŏl'dék, Germany, a principality consisting of two distinct portions, Waldeck proper and Pyrmont. Waldeck proper, with an area of 407 square miles, is enclosed by the Prussian provinces of Westphalia and Hesse-Nassau; and Pyrmont, with an area of 25 square miles, is enclosed by Prussia, Brunswick, and Lippe. Both sections are mountainous, and belong to the basin of the river Weser. Waldeck proper is nowhere much under 600 feet above sea-level, and in the western region, known as Upland, it attains in the Ettelsberg an elevation of 2,726 feet. Much of the soil is unsuited for agriculture, but some parts, such as the lower valley of the Eder and the northeast of Waldeck proper, are fairly fertile. The chief industries are agriculture and the rearing of cattle, sheep, pigs, and other animals. Manufactures are of small extent: the most important are tobacco and cigars (Pyrmont), liqueurs (Arolsen), and machines (Wetterburg). There are ironstone mines at Adorf. The constitution bears date 17 Aug. 1852. The princely dignity is hereditary according to primogeniture in the male line, but on the extinction of the male line is falls to the female line. The Diet consists of 15 members elected indirectly for three years. By the Treaty of Accession of 1867, renewed in 1877 and 1887, the internal administration is carried on by a Landesdirektor appointed by the Prussian government with the approval of the prince. Its courts of justice are subject to those of Cassel and Hanover, and its troops form a battalion of a Prussian infantry regiment. Arolsen is the capital and residential town. The Reformation was introduced under Count Philip IV. in 1526. The imperial field-marshal, George Frederick (1664-92), was the first of its rulers to assume the style of prince. In 1712 the ruler Anton Ulrich was created a prince of the empire. Waldeck supported Prussia

in the war of 1866, and entered the North German Confederation in the following year. The Treaty of Accession of 1867, which makes the prince a merely nominal sovereign, was the result of a desire expressed by the Diet for union with Prussia. Pop. (1900) 57,918, of whom 8,636 are in Pyrmont. The inhabitants are nearly all Lutherans.

Waldeck-Rousseau, vâl-dék-roo-sô, **Pierre Marie**, French statesman: b. Nantes 2 Dec. 1846. He studied law, was admitted to the bar at Nantes, was elected deputy for Rennes in 1879, and in 1881 was made minister of the interior in Gambetta's cabinet. This portfolio he held also with great success in the Ferry ministry of 1883-5, in 1886 was called to the Paris bar, and, though he continued to participate until 1889 in the debates of the Chamber of Deputies and in that year published a collection of 'Discours Parlementaires,' he then withdrew temporarily from public life and became one of the foremost of French advocates. His best known case was the defense of De Lesseps (q.v.) in the Panama canal matter. In 1894 he returned to politics as senator for the department of the Loire, in 1895 was an unsuccessful candidate for the presidency, and in 1899 was summoned by Loubet to form a ministry. On the second attempt, he succeeded in assembling in support of the Republic a cabinet including such diverse elements as Millerand, the Socialist, and General de Gallifet, who had so severely put down the Commune in 1871. He himself took again the ministry of the interior, and during the second Dreyfus trial, the strikes at Le Creusot, the prosecution and condemnation of Déroulède, and other troubles, he suppressed the disorder hitherto prevalent and enforced a regard for the law. The Associations bill of 1901, by which he asserted the religious associations were for the first time made subject to the rules governing others, was the principal event of the latter part of his administration. At the general election of 1902, Republican victory was complete, and Waldeck-Rousseau, regarding his service as accomplished, resigned 3 June 1902. He had proved himself one of the strongest figures in recent French politics. He further published: 'Discours Prononcés dans la Loire' (1896); 'Questions Sociales' (1900); 'Associations et Congrégations' (1901); 'La Défense Républicaine' (1902). Consult Ernest-Charles, 'Waldeck-Rousseau' (1902).

Waldemar I., vâl'dé-mär or wŏl'dé-mär (THE GREAT), king of Denmark: b. 1131; d. 1181. He succeeded Eric V. in 1147, was famous for his expeditions against the pirates of the Baltic, and successful in exacting from Magnus VI, king of Norway, a treaty which secured the pre-eminence of Denmark. **WALDEMAR II.** (the Victorious), younger son of the preceding, succeeded his brother Canute VI., in 1202. He made warlike expeditions into Sweden, Norway, and Germany, raised a powerful navy, and revised the laws of his kingdom. He died in 1241. **WALDEMAR III.**, eldest son of the preceding, was regent from 1219 to 1231. **WALDEMAR IV.**, third son of Christopher II., was in Bavaria at the death of his father in 1333. In 1340-4 he recovered part of his kingdom in war, and obtained some further successes against Sweden in 1353 and 1357; eventually, however, he was glad to obtain peace by large concessions.

WALDEN — WALDENSES

Walden, wâl'dën, John Morgan, American Methodist bishop: b. Lebanon, Ohio, 11 Feb. 1831. He was graduated from Farmer's (now Belmont) College, near Cincinnati, in 1852, and afterward engaged in teaching and in journalism. He was a member of the Topeka legislature in 1857 and a delegate to the Leavenworth constitutional convention in 1858, returning in that year to Ohio where he entered the Methodist Conference. He became minister in the Cincinnati Conference Methodist Church in 1858, was one of the publishing agents of the Methodist Book Concern in 1868-84, and in the last named year was elected bishop. He has traveled in every State in the Union and through Europe and Asia in making his episcopal visits.

Walden, Treadwell, American Episcopal clergyman: b. Walden, N. Y., 25 April 1830. He was graduated from the General Theological Seminary in 1853, took priest's orders in the Episcopal Church in 1856 and after holding charges in Newark, N. J., was rector of Christ Church, Norwich, Conn., 1857-63; Saint Clements, Philadelphia, Pa., 1863-8; Saint Paul's Cathedral, Indianapolis, 1869-72; Saint Paul's, Boston, 1873-6, and Saint Paul's, Minneapolis, 1882-5. He published: 'Lays of a Lifetime' (1856); 'The Sunday School Prayer Book' (1860); 'Privations and Sufferings of United States Officers and Soldiers in Confederate Prisons' (1864); 'Our English Bible and its Ancestors' (1870); 'An Undeveloped Chapter in the Life of Christ' (1882); 'The Great Meaning of Metanoia' (1896).

Walden, N. Y., village in Orange County; on the Walkill River, and on the New York Central & Hudson River railroad (Walkill Valley branch); 75 miles north by west of New York, and 13 miles northwest of Newburgh. The date of the first settlement is uncertain, but it was before 1768; the village was incorporated in 1855. It was first known as High Falls, owing to the fall of 40 feet in the river at this point. It is in an agricultural region, noted for its dairy products and in a valley famous for its picturesque scenery. It has large cutlery works, woolen mills, a soap factory, engine works, foundries, and machine shops. There are two banks, one of which is a national bank. Pop (1890) 2,132; (1903) 3,147.

Walden University, an institution for the education of the colored race, located at Nashville, Tenn. It grew out of a school for adults and children established by the Freedmen's Aid Society; in 1866 it was chartered as Central Tennessee College. It is under the control of the Methodist Episcopal Church. In 1900 the name was changed to Walden University in honor of Bishop John M. Walden. The university includes the following departments: (1) Collegiate department; (2) academic department (preparatory); (3) normal department; (4) commercial department; (5) law department; (6) Braden Bible Training School; (7) music department; (8) Meharry Medical College; (9) industrial department. The collegiate department offers two four years' courses, the classical and the scientific; and two corresponding preparatory courses of three years. The normal department offers a course five years in length (instead of four years, as formerly); the first three years are the same in the college

preparatory course; the completion of this course entitles the student to the degree of bachelor of pedagogy. The academic department offers a two years' English course, and a two years' teacher's preparatory course. In all these courses the daily study of the Bible is required. The law department, which was the first law school for colored students established in the South, has a two years' course. The Braden Bible Training School offers a theological course, correspondence courses in theology, and a missionary and deaconess training course. The theological course is two years in length, with a year of post-graduate work; the missionary training course includes studies in industrial department and the medical school. The Meharry Medical College was founded in 1876; it offers a four years' medical course, which may be completed in three years by those holding an A.B. or B.S. degree; the dental college, the pharmaceutical college, and the nurses' training school are also a part of the medical department. The industrial department includes the trade schools, the school of domestic science and art, and the Walden Industrial School. The trade schools instruction and practice in carpentry, sloyd, painting, paper-hanging, calcimining, masonry and plastering, and landscape gardening for men, and in sloyd for women; the school of domestic science provides instruction in cooking, sewing, laundry work, etc., for women; the industrial school is for the industrial training of children, and serves also as a model school for normal department. When the students attain sufficient proficiency in industrial classes, work is furnished them by which they may pay a portion of their expenses. The students maintain two literary societies. The university buildings (1904) on the campus include the administration building, seven other brick buildings, and seven wooden buildings; the medical college is located in another part of the city. The library in 1904 contained 2,500 volumes; students of the law department also have access to the State Law Library. The students in 1903 numbered 755, of whom 339 are in the medical department. Many of the graduates are teachers; and others are successful doctors and lawyers.

Waldenses, wöl-dën'séz. This mediæval sect owes its origin and name to Peter Waldo (Waldo), a rich citizen of Lyons, although some of their writers derive the appellation Waldenses from *vallée* (valley), and called them *Vaudois*, or dwellers in the valleys, whilst others have traced their origin to the earlier sects of Henricians and Cathari. About 1170 Waldo, shocked and moved to repentance for his sins by the sudden death of a friend, came to the determination to imitate the mode of life of the apostles and primitive Christians, gave his goods to the poor, and by his preaching collected numerous followers, chiefly from the class of artisans, who, from the place of their birth, were denominated *Leonists*, or the poor of Lyons: *Sabatati* or *Insabatati*, on account of their wooden shoes or sandals (*sabots*); *Humiliatists*, on account of their profession of humility; and were often confounded with the Cathari, Patarenes, Albigenses, and others, whose fate they shared. Their chief strongholds were, and still are, in the mountain tract of the Cottian Alps, southwest of Turin. In their fanatical contempt of the clergy and their opposition to the Roman priest-

WALDERSEE

hood the Waldenses resembled other sects of like character in the Middle Ages; but, going beyond the design of their founder, which was merely to preach penance and a life of poverty, they made the Bible alone the rule of their faith, and rejecting whatever was not founded on it as not conformable to apostolical antiquity, they renounced entirely the doctrines, usages, and traditions of the Roman Catholic Church, and formed a separate religious society. They were therefore excommunicated as heretics at the Council of Verona in 1184, but they did not suffer a general persecution until the war against the Albigenses, whom they closely resembled in the extravagances of their doctrines and customs, after they had spread and established themselves in the south of France, under the protection of the counts of Toulouse and Foix. At that time (1209-30) many Waldenses fled to Aragon, Savoy, and Piedmont. In Languedoc they were able to maintain themselves till 1330; in Provence, under severe persecution, till 1545, when the parliament at Aix caused them to be driven out of the country, still longer in Dauphiny; and not until the war of the Cevennes were the last Waldenses expelled from France. In the middle of the 14th century single congregations of this sect went to Calabria and Apulia, where they were soon suppressed; others to Bohemia, where they were called Grubenheimer, because they used to conceal themselves in caverns. They soon became amalgamated with the Hussites; and from them the Bohemian brethren derive the apostolical consecration of their bishops. Their doctrines rest solely on the Bible, which, with some catechisms, they have in their old dialect, consisting of a mixture of French and Italian. In this language their worship was performed till their old *Barbes* (uncles, teachers) became extinct in 1603. They then received preachers from France, and since that time their preaching has been in French. These teachers, however, form no distinct priesthood, and are supplied from the academies of the Calvinistic churches. Their rites are limited to baptism and the Lord's supper, respecting which they adopt the views of Calvin. The constitution of their congregations which are chiefly employed in the cultivation of vineyards and in the breeding of cattle, and which are connected by yearly synods, is republican. Each congregation is superintended by a consistory composed of elders and deacons, under the presidency of the pastor, which maintains the strictest moral discipline, and adjusts small differences. After they had entered into a religious communion with the Calvinists, in the 16th century, they were also exposed to the storm which was intended to sweep away Protestantism, and this was the cause of their extirpation in France and their checkered fate in Piedmont. Those who had settled in the marquise of Saluzzo were totally suppressed by 1633; and those in the other valleys, under the jurisdiction of the court of Turin, were subjected to severe persecution, often occasioned by their own aggressiveness. Aided by the mediation of the Protestant powers, they finally procured a new, though more limited, ratification of freedom by the treaty concluded at Pinerolo 18 Aug. 1655. The persecution exercised in 1685 through French influence obliged thousands to emigrate into Protestant countries, including the English col-

onies in North America. In London they united with the French Huguenots; in the Netherlands with the Walloons; in Berlin with the French congregations; and nearly 2,000 went to Switzerland. Some of these returned by force to Piedmont in 1680, and with those who had remained maintained themselves under many restrictions, to which an end was finally put in 1725 in consequence of Prussian mediation.

The Waldenses were not permitted to enjoy full religious freedom and civil rights until the establishment of the kingdom of Italy, but now they do so not merely in their old valleys of Lucerne, Perusa, and Saint Martin, but generally throughout Italy, and they have churches in Turin, Rome, Venice, and elsewhere. Their church service is under the direction of a synod. After long negotiations, in the way of which great difficulties were thrown by the opposition of the Tübingen theologians, several hundreds of the above-mentioned fugitives settled in Württemberg in 1699, where their descendants now form several parishes. They are next to the Calvinists in the simplicity of their worship and in their ecclesiastical constitution, but in intellectual cultivation are behind the other Protestants. (See REFORMATION; RELIGIOUS SECTS.) Consult: Léger, 'Histoire générale des églises évangéliques des vallées de Piémont ou Vaudoises' (1699); Dieckhoff, 'Die Waldenser im Mittelalter' (1851); Herzog, 'Die romanischen Waldenser' (1853); Melia, 'Origin, Persecution, and Doctrines of the Waldenses' (1870); Montet, 'Histoire littéraire des Vaudois du Piémont' (1885); Preger, 'Die Verfassung der französischen Waldenser in der älteren Zeit' (1890); Bompiani, 'Short History of the Italian Waldenses' (1897); Schaff, 'Creeds of Christendom' (1877-8).

Waldersee, vāl'dēr-zā, **Albert**, COUNT VON, German soldier: b. Potsdam, Prussia, 8 April 1832; d. Hanover 5 March 1904. He entered the Prussian artillery of the guard in 1850, and in 1866 was assigned to the general staff and promoted major. During the Bohemian campaign he was connected with the general headquarters, after the peace became a member of the staff of the 10th army corps, and in 1871, at the outbreak of the Franco-Prussian war, was made chief-of-staff to the Grand Duke of Mecklenburg-Schwerin, commander of one of the divisions. Promoted colonel and commander of the 13th Uhlans, his subsequent advancement was rapid. In 1880 he became a general, in 1882 lieutenant-general, in 1888 general of cavalry. Upon von Moltke's resignation as chief of the general staff (1888), Waldersee was chosen as successor; and it was very generally believed that he would follow Bismarck in the chancellorship, for which, however, Count von Caprivi was selected. Waldersee became commander of the 9th army corps in 1891, in 1898 inspector-general, in 1900 field-marshal of the empire. At the time of the Boxer outbreak in China (see BOXERS) he was placed in command of the German forces in that country, and from 27 Sept. 1900 to 4 June 1901, by approval of the powers, commanded the allied armies there. His activities in China contributed largely to a speedy adjustment of difficulties, while he was at the same time successful in preserving harmony among the allies.

WALDIS — WALDSEEMULLER

Waldis, Burkard, vāl'dis, German rhyming fabulist: b. about 1490; d. about 1557. He was a Franciscan friar, but on returning from a pilgrimage to Rome, embraced the doctrines of Luther. He wrote a charming drama in Low German, 'The Parable of the Prodigal Son'; translated the 'Psalter' into German verse; and wrote 'Æsopus,' a collection of about 400 rhymed fables and drolleries.

Waldmüller, Ferdinand, Austrian painter: b. Vienna 1793; d. 1865. He was very successful as a painter of peasant life, and also drew much of his inspiration from the life of childhood. Among his principal works are: 'Two Tyrolese Huntsmen Resting' (1820); 'Beggar Boy on the Bridge' (1830); 'Soup Day at the Convent' (1858); 'After School' (1841); 'Sunday Afternoon' (1846); 'Palm Sunday' (1855); and 'Evening Prayer' (1864).

Waldmüller, Robert, vāld'muhl-ler, pseudonym of Charles Edouard Duboc, a German poet and miscellaneous writer: b. in Hamburg 17 Sept. 1822; d. about 1557. His best work is 'Village Idylls' (1860). Other works are 'Travel Studies' (1860); 'Sorrow and Joy,' a romance (1874); 'Brunhild,' a drama (1874).

Waldo, wōl'dō, Daniel, American Congregational clergyman: b. Windham, Conn., 10 Sept. 1762; d. Syracuse, N. Y., 30 July 1864. He was drafted as a soldier in the army in 1778, and was arrested and captured by the Tories and carried to New York, where he was confined for two months, and then exchanged. After graduation at Yale in 1788 he studied theology, and in 1792 was ordained pastor of the Congregational Church in West Suffolk, Conn. Here he continued till 1809, when he resigned his charge, having for some time acted as a missionary in the States of Pennsylvania and New York. In 1810-11 he preached at Cambridgeport, Mass., after which he served as a missionary in Rhode Island till 1820, and was settled for 12 years at Exeter, Conn.; and afterward resided in the State of New York, without any stated charge. In 1855 he was made chaplain of the House of Representatives.

Waldo, Frank, American meteorologist: b. Cincinnati, Ohio, 4 Nov. 1857. He was graduated from Marietta College, Ohio, in 1878, subsequently studied at Harvard, and in 1882-3 was in Europe on United States government service. Upon his return to the United States he became instructor in astronomy at Radcliffe College, and was later engaged in teaching meteorology at the Corcoran School of Science, Columbian University. He afterward accepted the position of junior professor in the United States Signal Service, and has since become professor. He has published: 'Modern Meteorology' (1893); 'Elementary Meteorology' (1896); etc.

Waldo, Peter, French merchant: b. in the latter half of the 12th century; the date of his death is unknown. Waldo had acquired considerable wealth, when the sudden death of a friend turned his attention to spiritual things. He had translations made of portions of the Scriptures, which he read, and became convinced that he should lead a life of poverty. He gave part of his property to his wife and part to the poor, and began to preach his doctrines in the streets of Lyons. He advocated the study of the Scriptures by the individual Christian, and the right of laymen to teach.

This brought upon him the condemnation of the Church, and the archbishop of Lyons forbade Waldo and his followers to continue their teaching. They appealed to the pope, and at the Lateran Council in 1179 they were condemned. See WALDENSES.

Waldo, Samuel Putnam, American author: b. in Connecticut in 1780; d. Hartford, Conn., March 1826. He wrote: 'Narrative of a Tour of Observation by President Monroe' (1818); 'Memoirs of Andrew Jackson' (1820); 'Life of Stephen Decatur' (1821); 'Biographical Sketches of Nicholas Biddle, Paul Jones, Edward Preble, and Alexander Murray' (1823). He edited 'Journal of the Brig Commerce upon the Western Coast of Africa.'

Waldoboro, wōl'dō-būr-ō, Maine, town, port of entry, Lincoln County; on the Medomak River, and on the Maine Central railroad; about 26 miles southeast of Augusta, and 18 miles west of Rockland. It was settled in 1749 by a colony of Germans, and in 1773 was incorporated. It is in an agricultural section. The chief manufacturing establishments are a shoe factory, machine shop, men's clothing factory, and creameries. Formerly the town was noted for its ship-building. The principal public buildings are the United States custom-house, the churches, schools, and the bank. Pop. (1890) 3,505; (1900) 3,145.

Waldseemüller, Martin, the scholar who gave America its name. He was born at Freiberg, and his name was written in the school-list for the first time at that place 7 Dec. 1490. Assuming that this matriculation occurred when he was 8 or 9 years old, we have as the year of his birth 1481 or 1482. Equally conjectural is the year of his death. In 1522, L. Fries referred to him as deceased, and it has been supposed that the event was then recent. Certain it is that Waldseemüller was canon of St. Dié when he died, and that in the same Vosgian mountain town before 1507 he was regarded as an able young geographer by the little group of learned men there assembled. His 'Cosmographiæ Introductio' and his map of the world (the latter prepared as a globe also: "*tam in solido quam plano*"), both published at St. Dié in the year last mentioned, produced the effect described in our first volume (see AMERICA: a brief account of the derivation and meaning of the word). The name confidently proposed for the transatlantic lands, and at the same time actually conferred upon the new "*quarta orbis pars*," in the little Latin treatise and on the huge wall-map and globe, was so promptly and generally caught up that its originator himself was powerless to recall it. When he issued his 'Carta Marina,' in 1516, he had changed his opinion as to the relative value of the achievements of Columbus and Amerigo Vespucci, for the word America does not appear on the map of 1516. But it was, fortunately, too late to impose a name less significant and less appropriate (see article mentioned above, and contrast the meaning of "America" there given with that of "Columbia," that is, "land of the dove"). Of the Waldseemüller map of 1507, 1,000 copies were printed, yet all were destroyed or lost long ago, and, indeed, the same fate had overtaken the Carta itineraria Europæ of 1511, and the Carta Marina of 1516. The Carta itineraria was the first to be recovered; the more interesting maps of 1507 and

WALDSTEIN — WALES

1516 did not come to light until 1901, when their discovery created a sensation. In 'The Geographical Journal' for February 1902 we read: "Ever since Humboldt first called attention to the 'Cosmographiæ Introductio' no lost maps have ever been sought for so diligently as those of Waldseemüller. It is not too much to say that the honor of being their lucky discoverer has long been considered as the highest possible prize to be obtained among students in the field of ancient cartography. But until the last few months no specimen of either the globe or map has ever been seen or heard of in modern times. A few months ago the geographical world was suddenly startled by a brief announcement that Waldseemüller's long-lost map of 1507, together with another of his of 1516, had been found by Prof. P. Joseph Fischer of Feldkirch, in the library of Prince Waldburg at Wolfegg Castle." In the excellent work by Fischer and Wieser (see below) it is written that "Johann Schöner had the two Waldseemüller maps bound in the form of an atlas. To this circumstance we owe the preservation of the two precious cartographic monuments, while those copies that were mounted as wall-maps perished—as it seems, without exception—in consequence of their enormous size." In conclusion we would invite attention to two points: (1) The assertion so commonly made, that Waldseemüller intended to bestow the name America upon the southern continent only, appears at first sight to find support in the map of 1507, but is disproved by a comparison of the map with the explanatory passages in the 'Introductio'; (2) the Greek form of his own name on the map of 1516 is *Ilaconilus*, showing plainly his preference for that spelling toward the end of a rather short life. The fact that his name does not stand in any form upon the map of 1507 is additional evidence of juvenility. He appears to have been so young that his signature might have made good work seem less authoritative then. He was perhaps 25 years old when he produced a word that was to fill a place in all languages during all later ages.

Consult: Fischer and Wieser, 'Die älteste Karte mit dem Namen America'; Humboldt, 'Kritische Untersuchungen'; d'Arvezac, 'Martin Hylacomylus Waltzemüller'; HARRISSE, 'Bibliotheca'; 'Decouverte,' etc.

MARRION WILCOX,

Author of 'History of War with Spain'; 'Ivar in Philippians,' etc.

Waldstein, wäld'stīn, **Charles**, American archaeologist: b. New York 30 March 1856. Educated at Columbia and Heidelberg universities he became university lecturer in classical archaeology at Cambridge, England, 1880-2. He was appointed director of the Fitzwilliam Museum there 1883-9, a fellow of King's College, Cambridge, 1893, and has been Slade professor of fine arts at same college since 1895. As director of the American School of Classical Studies at Athens (1889-95) and professor (1895-7), he directed excavations with signal success at Plataea, Eretria, etc. He has written: 'Excavations at the Heraion of Aegus'; 'Balance of Emotions and Intellect' (1878); 'Essays on the Art of Phidias' (1885); 'The Work of John Ruskin' (1894); 'The Study of Art in Universities' (1895); 'The Surface of Things' (1899); 'The Jewish Question' (1890); 'The Expansion of Western Ideals and the World's Peace' (1899); 'The Argive Heræum' (1902).

Wales wälz, **Prince of**, title given to the eldest son of the English sovereign since the time of Edward I. In 1902 the Prince of Wales was George Frederick Ernest Albert: b. Marlborough House 3 June 1865. He entered the navy 5 June 1877, spent two years on the training ship *Britannia*, and then accompanied by his brother, the late Duke of Clarence, started on a three years' voyage around the world on board the *Bacchante*. In 1883 he was made a midshipman on the *Canada*, stationed off the North American coast, and in 1885 was promoted lieutenant. He was made commander in 1890 and opened the Jamaica Industrial Exhibition. In 1891 he visited Ireland with the Duke of Clarence, and, on the latter's death in 1892, became heir to the throne and took his seat in the House of Lords as Duke of York. He was married to the Princess Victoria Mary of Teck, at Saint James' Palace, 6 July 1893, the ceremony being attended by the King and Queen of Denmark, the Czarewitch, and other royal and imperial guests. In 1901 he was appointed rear-admiral, and colonel-in-chief of the Royal Marine Forces. On 22 Jan. 1901, by the death of Queen Victoria, he succeeded his father as Duke of Cornwall, and with the duchess made a tour of the colonies, opening the first Parliament of the Commonwealth of Australia, and returning in November.

Wales, Great Britain, a former Celtic kingdom in the central western peninsula, now an administrative division of England, and a principality, which gives the title of Prince of Wales to the heir-apparent of the British crown. It has an area of 7,466 square miles, divided into 12 counties. For the names, areas, and populations of the counties see the article ENGLAND; and for statistical matter see GREAT BRITAIN.

Wales is composed of a peninsula, with the island of Anglesey at its northwest extremity, joined at the Menai Strait by two remarkable bridges; a number of smaller islands lie chiefly at a short distance from the southwest coast. The peninsula, washed north and west by the Irish Sea, and south by Bristol Channel, and bounded west by the four English counties, Cheshire, Shropshire, Hereford, and Monmouth, is 135 miles long; where widest 95 miles, and where narrowest only 35 miles broad. It is very mountainous, particularly in the north division, where Snowdon, the culminating point of South Britain, rises to the height of 3,571 feet; is intersected by beautiful valleys, traversed by numerous streams, including among others the Severn, which has its source within it; and is rich in minerals, particularly copper in the north, and coal and iron partially there also, but much more extensively in the south. The Silurian formation, so called after the Silures, the ancient inhabitants of the principality, covers more than two thirds of the whole surface, extending continuously from the mouth of the Conway to the vicinity of Saint David's Head; but is succeeded in the south by the Old Red Sandstone, above which lies the mountain-limestone and the large and valuable coal-field. Besides the Severn, the principal rivers are the Dee, which has part of its lower course in Cheshire; the Clwyd, in Denbigh and Flint; the Conway, forming the boundary between Denbigh and Carnarvon; the Dovey, and the united Rheidol and Ystwith, which have their mouths near the centre of Cardigan Bay; the Teify, separating Cardigan on the north from Carmarthen and

WALES

Pembroke on the south; the Cleddy and Cleddeu, remarkable chiefly from contributing, by their junction, to form the splendid estuary of Milford Haven; the Towy and Bury, which both fall into Carmarthen Bay; the Ebwy and Taf, which have a common estuary in Bristol Channel; the Romney, which forms part of the boundary between Wales and England; and the Usk and Wye, which, though rising in the principality, have only the earlier part of their course within it. The lakes are numerous, but the largest, that of Bala, is only four miles long and scarcely one mile broad. The climate is on the whole moderate and equable, though somewhat keen in the loftier districts. In all the counties, but more especially in the maritime, humidity is in excess, the average fall of rain in the principality being 34 inches, while that in England is only 22. Both climate and surface render Wales more adapted for pasture than agriculture. The soil, too, seldom possesses great natural fertility, except in some of the vales, of which those of the Clwyd in the north, and of Glamorgan in the south, are celebrated for productiveness. The latter, rather a plain than a vale, is of great extent, and grows excellent wheat. The system of agriculture, however, notwithstanding recent improvements, continues on the whole indifferent. The minerals, as already observed, are very valuable, and the south contains some of the largest coal and iron works in the kingdom, as well as the copper works of Swansea, probably the most extensive in the world. Of manufactures, properly so called, by far the most important are woollens. The principal articles are flannel, for which the principality has long been famous, cloth chiefly of a coarser description, and hosiery. The inhabitants are almost purely Celtic in race, being the descendants of the early Britons, who were able to maintain themselves here when the rest of the country was overrun by the Germanic invaders. One of the most striking native features is the female dress, consisting generally of a plain or checked gown, a mantle, a napkin of gay colors around the neck and shoulders, and a black beaver hat, broad-brimmed and tapering to the form of a truncated cone. All classes are distinguished by civility and hospitality. Many curious superstitions, handed down by immemorial custom, still retain their hold. The Welsh cherish their Brythonic or Cymric language with great affection. They have transplanted it to America, where it prevails in some districts, and is represented by newspapers. In 1891 there were in Wales 508,000 people who knew no English, or at least habitually spoke Welsh. Most of the upper class belong to the Established Church, but the majority are Nonconformists, the most numerous bodies being the Congregationalists, the Calvinistic Methodists, and the Baptists. See CELTS; CYMRIC; and for *Welsh Language and Literature*, see CELTIC LANGUAGES.

History.—Previous to the Roman occupation Wales appears to have been chiefly inhabited by three British tribes, called the Silures, Dimetæ, and Ordovices. During the later period of the Roman occupation, perhaps from the reign of Diocletian, the subject part of the island was divided into four provinces, of which one, including the country from the Dee to the Severn, was called *Britannia Secunda*. It was after the invasion of the Saxons that the country

acquired a distinctive national character, as the refuge of the vanquished Britons who were gradually driven to the west, and many of whom migrated to Brittany (q.v.), France, whence the name, and similarity of the Breton language to the Welsh. From this period till the final conquest of the country by Edward I. there is little but a succession of petty wars between the rival chiefs or kings into which both countries during a great part of the Saxon period were divided, or the more systematic efforts of the larger monarchy to absorb the smaller. Among the greatest of the Welsh heroes of the early period was Cadwallon. After being defeated by Edwin of Deira, or Northumbria, and compelled to flee to Ireland, he returned and defeated the Saxons in numerous battles, but was at last defeated and slain by Oswald of Northumbria in 635. While the border territories continued to be contested in incessant warfare between the two races, Offa of Mercia built the celebrated dyke (see OFFA'S DYKE) known by his name to guard the marches which he had conquered. In the middle of the 9th century Roderick, or Rhodi Mawr, succeeded in uniting the whole of Wales into one principality, but he divided it among his sons into three principalities, called respectively Gwynedd (or North Wales), Ceredigion and Dyved (or South Wales), and Powys (composed of parts of the counties of Montgomery, Salop, and Radnor). Soon after this the Danes began to invade Wales. The country was again re-united in the 10th century under Howel, surnamed Da, the Good; but as the English monarchy also acquired unity it gradually prevailed over the smaller principality, and Athelstane received tribute as the sovereign of Wales, although his sway in the country was only nominal. The claim of the conqueror being resisted, William invaded the country and compelled the Welsh princes to do homage, but they continued in virtual independence, and became troublesome to the succeeding Norman monarchs by allying themselves with their disaffected subjects. William and his successors tried to break their spirit by granting fiefs in Wales to Normans and English on condition of conquest, and Henry I. introduced into the country a colony of Flemings. Henry I., Henry II., John, and Henry III., all made with various success a series of efforts to reduce the Welsh princes to submission. Llewellyn and David, princes of North Wales, successively did homage for that dominion to Henry III. On the death of David, Llewellyn revolted against Edward I., but was defeated by Henry, and in a subsequent revolt was again defeated and slain by the Earl of Mortimer, 1284. His brother David, who followed his example, was taken and executed. Edward I. created his eldest son Prince of Wales, and from this time Wales was united with England.

Wales, University of (in Welsh, *Prifysgol Cymru*), a British institution established by charter in 1893, and formed by the union or association of three existing colleges, the Uni-

versity College of Wales, Aberystwith, founded in 1872; the University College of North Wales, Bangor, founded in 1884; and the University College of South Wales and Monmouthshire, Cardiff, founded in 1883. Each of the colleges has a women's hall of residence, that of the last being known as Aberdare Hall. There are no special university buildings apart from those of the colleges, but there are temporary offices at Newport, Monmouth. The university has power to grant degrees in arts or literature, science, law, theology, and music; but the constituent colleges do not supply a full course of instruction in each of these subjects, the necessary courses for the degrees of B.A. and B.Sc. being at present those chiefly provided. As regards theology, instruction is furnished by a number of theological colleges in the principality, at which students may qualify for the degree of B.D. The classes are open to persons of either sex above the age of 16 years. The first matriculation examination of the university was held in 1895.

Walfish, wöl'fish, or **Walvisch, Bay**, West Africa, a harbor and small territory belonging to Great Britain since 1878, on the coast of German Southwest Africa, close to the parallel of 23° south. The harbor, frequented by whale fishers, is a good one, and is formed by a sandy spit of land which projects northward parallel with the coast, and ends in a point known as Pelican Point. It receives the river Kluiseb at its head, and just beyond the northern frontier of the territory is the mouth of the river Swakop, where the German authorities have constructed a new harbor, known as Swakopmund. The enclave is included in Cape Colony for administrative purposes. The area is 430 square miles, and the population 768, of whom only 31 are white.

Walford, wâl'fêrd, **Lucy Bethia Colquhoun**, English novelist: b. Portobello, Scotland, 17 April 1845. She was married to A. S. Walford of Cranbrooke Hall, Essex, in 1869. Her first novel, 'Mr. Smith,' appeared in 1874, and in certain respects it has not been surpassed by any of her later works, although she has gained in ease of dialogue and description. A sound ethical purpose underlies all her many novels, among the best of which are 'Cousins' (1879); 'Troublesome Daughters' (1880); 'The Baby's Grandmother' (1885); 'The Archdeacon' (1899); 'Sir Patrick, the Puddock' (1900).

Walhall, väl-häl'lä, **Valhal**, or **Valhalla**, the great hall of the Scandinavian gods, the warriors' heaven of the Vikings. Here the heroes slain in battle feasted with Odin, drinking mead from the udder of the goat, lleidrun, and eating the flesh of the boar, Sæhrimnir, which was cooked every day, and became whole again after each daily banquet. The hall was lighted by gleaming swords, roofed with shields, and the seats covered with coats of mail. Apart from feasting, fighting their battles over again was the favorite pastime of the heroes admitted to Walhalla. See SCANDINAVIAN MYTHOLOGY.

Walke, wâk, **Henry**, American naval officer: b. near Portsmouth, Va., 24 Dec. 1808; d. Brooklyn, N. Y., 8 March 1896. He was appointed midshipman in the navy in 1827, was promoted lieutenant in 1839, and in the Mexican

War was executive officer on the *Vesuvius*, engaged at the capture of Vera Cruz. He was promoted commander in 1855 and in 1861 was assigned to duty with the Mississippi flotilla, receiving rank as captain in 1862. He commanded the squad of gunboats which assisted Grant at Belmont; was engaged at the battles of Forts Henry and Donelson, Island No. 10, and Fort Pillow; successfully passed the Vicksburg batteries; and in 1863 was transferred to the command of the Sacramento and sent in pursuit of the Alabama. He was promoted commodore in 1866, rear-admiral in 1870, and in 1871 was at his own request placed on the retired list.

Walker, wâ'kêr, **Amasa**, American political economist: b. Woodstock, Conn., 4 May 1799; d. North Brookfield, Mass., 29 Oct. 1875. A prominent merchant of Boston from 1825 to 1840, he was known also as an abolitionist in 1843, and 1849 visited London and Paris respectively to attend the international peace conventions of those years, and in 1848 took a leading part in the formation of the Free-Soil party. In 1848 he was a representative in the State legislature, in 1849 State senator, in 1851-2 secretary of State, having been elected by the united Free-Soil and Democratic vote. He was a member of the House of Representatives in 1862-3, to complete the unexpired term of Goldsmith F. Bailey. From 1842 to 1849 he was professor of political economy in Oberlin College; and he published: 'The Nature and Uses of Money and Mixed Currency' (1857), and 'The Science of Wealth: A Manual of Political Economy' (1866; 7th ed. 1874).

Walker, Asa, American naval officer: b. Portsmouth, N. H., 13 Nov. 1845. He was graduated from the United States Naval Academy in 1866, received promotion to lieutenant in 1870, and to commander in 1894. He was on duty at the Naval Academy in 1873-6, 1879-83, 1886-90, and in 1893-7. In the last named year he was placed in command of the Concord, and in 1898 was engaged with her in the battle of Manila Bay. He received rank as captain in 1899 and was assigned to duty at the Naval War College, Newport, R. I. He was a member of the naval examining board at Washington in 1900-1 and since 1903 has been in command of the San Francisco.

Walker, Francis Amasa, American economist and soldier: b. Boston 2 July 1840; d. there 5 Jan. 1897. He was the son of Amasa Walker (q.v.), was graduated at Amherst in 1860, began the study of law, which he gave up to enlist in the Union army, and served through nearly the whole of the Civil War. His rank during the greater part of the War was that of lieutenant-colonel, and in 1865 he was brevetted brigadier-general of volunteers. He taught Greek and Latin at Williston Seminary, Easthampton, Mass., from 1865 to 1868, and in the latter year was connected with the staff of the Springfield *Republican*. After serving as head of the Bureau of Statistics of the Treasury Department, in 1870 he was made superintendent of the 19th census, and in 1872 became commissioner of Indian affairs. From 1873 to 1881 he was professor of political economy and history in the Sheffield Scientific School at Yale, and in 1877-9 was lecturer at Johns Hopkins University. He was the representative of the United

WALKER

States at the International Monetary Conference, Paris, in 1878. In 1880 he was appointed superintendent of the 10th census. Accepting the presidency of the Massachusetts Institute of Technology in 1881, he continued in that position till his death. He was president of the American Statistical Association from 1882 to 1897, and of the American Economic Association in 1885-92. He was an earnest advocate of international bimetallism, was deeply interested in all economic questions, particularly those concerning wages and profits, upon which he wrote with effective clearness and force. His work has exerted a marked influence upon economic study. His writings include: 'The Indian Question' (1874); 'The Wages Question' (1876); 'Money' (1878); 'Money in Its Relation to Trade and Industry' (1879); 'Political Economy' (1883); 'Land and Its Rent' (1883); 'History of the Second Army Corps' (1886); 'Life of General Hancock' (1894); 'The Making of the Nation' (1895); and 'International Bimetallism' (1896). Consult 'Publications of the American Statistical Association,' Vol. V. (1896-7), for bibliography and biographical notices.

Walker, Frederick, English painter: b. London 26 May 1840; d. Saint Fillans, Perthshire, 4 June 1875. After an ordinary school education he worked for a time in an architect's office, and then pursued his art studies at the British Museum, in an Art Academy, and in the Royal Academy schools. He became an apprentice to Whymper, the wood engraver, in 1858, and soon afterward began to provide drawings for 'Good Words,' the 'Cornhill Magazine,' and other periodicals. He illustrated the 'Adventures of Philip' and the 'Denis Duval' of Thackeray. He exhibited his first oil picture, 'The Lost Path,' at the Academy in 1863. He was elected an associate of the Old Water-color Society in 1864, and in 1871 he became an associate of the Royal Academy. His principal pictures in oils were: 'Wayfarers' (1866); by some considered his best oil-painting; 'Bathers' (1867); 'Vagrants' (1868), in the National Gallery; 'The Old Gate' (1869); 'The Plough' (1870); 'At the Bar' (1871); 'The Harbour of Refuge' (1872), in the National Gallery; and 'The Right of Way' (1875). Among his more numerous works in water-color the following may be mentioned: 'Philip in Church' (1863); 'The Young Patient'; 'The Shower'; 'The Village School'; 'Jane Eyre'; 'Refreshment'; 'Spring'; 'Autumn' (1865); 'The Bouquet' (1866); 'The Gondola'; 'In a Perthshire Garden'; 'The Housewife'; 'The Rainbow'; and 'The Fishmonger's Shop.' Consult Marks, 'Life and Letters of Frederick Walker' (1896).

Walker, George, Irish Anglican clergyman: b. of English parents in County Tyrone 1618; d. Boyne 1 July 1690. He was educated at Glasgow University, took orders, and in 1674 became rector of Donaghmore, near Dungannon. In April 1689 was made joint governor of the besieged town of Londonderry after the traitorous governor, Lundy, had been allowed to escape, and did much to inspire the heroic defenders in the siege of 105 days. He received the thanks of the House of Commons, and had honorary degrees conferred upon him by Cambridge and Oxford. He fell at the battle of the Boyne, being at the time of his

death bishop-designate of Derry. His 'True Account of the Siege of Londonderry' (1689) and 'Vindication' of it are reprinted in Dwyer's 'Siege of Londonderry' (1893).

Walker, Hugh, Scottish author: b. 7 Jan. 1855. He was educated at the universities of Glasgow and Oxford, and is professor of English literature at Saint David's College, Lampeter, South Wales. He is the author of 'Three Centuries of Scottish Literature' (1893); 'Greater Victorian Poets' (1895); 'The Age of Tennyson' (1897).

Walker, James, American college president and Unitarian clergyman: b. Burlington, Mass., 16 Aug. 1794; d. Cambridge, Mass., 23 Dec. 1874. He was graduated from Harvard in 1814, studied for the ministry, and was pastor of the Unitarian Church, Charlestown, Mass., 1818-39. He was professor of moral and intellectual philosophy at Harvard 1839-53, and president of Harvard University 1853-60. From 1831 to 1839 he edited the 'Christian Examiner.' He edited the works of Dugald Stewart, and Thomas Reid, published a 'Memoir of Josiah Quincy' (1867), and delivered lectures on 'Natural Religion' and 'The Philosophy of Religion.' He was famous as a pulpit orator.

Walker, James, American artist: b. England 3 June 1819; d. Watsonville, Cal., September 1889. He emigrated to the United States and settled in New York city early in life. In 1884 he went to San Francisco to paint a picture for a private gallery. It was a French battle-piece, and his success was so complete that he became widely known as a painter of military pictures. His principal works include: 'The Battle of Lookout Mountain'; 'The Battle of Chapultepec'; and 'The Repulse of Longstreet at Gettysburg.'

Walker, John, English actor and lexicographer: b. Colney Hatch, Middlesex, 18 March 1732; d. London 1 Aug. 1807. He was for a time engaged by Garrick at Drury Lane, was a leading member of the company at Crow Street Theatre, Dublin, 1758-62, and was at Covent Garden 1762-7. In 1768 he left the stage, and, after conducting a school at Kensington for two years, became a lecturer on elocution. His published works include, among others: 'A Dictionary of the English Language, answering at once to the Purposes of Rhyming, Spelling, and Pronouncing' (1775; latest ed., 1888); 'Elements of Elocution' (1781); 'A Rhetorical Grammar' (1785); 'The Melody of Speaking Delineated' (1789); 'A Critical Pronouncing Dictionary and Expositor of the English Language' (1791), his chief work, which was long regarded as a standard for pronunciation and which has gone through many editions.

Walker, John Grimes, American rear admiral: b. Hillsboro, N. H., 20 March 1835. He was graduated from the Naval Academy in 1856, and during the Civil War was employed in the blockading service and in the Mississippi squadron, becoming lieutenant-commander in 1862; in 1866 he was specially promoted to the rank of commander for gallantry in war. He was chief of the bureau of navigation 1881-8, became commodore in 1889, and commanded the squadron of evolution 1889-93. In 1894 he was appointed to protect American interests in the

WALKER

Hawaiian Islands, was commissioned rear admiral the same year, and was retired in 1897. Since 1899 he has been president of the Isthmian Canal Commission.

Walker, Robert James, American financier and political leader: b. Northumberland, Pa., 19 July 1801; d. Washington, D. C., 11 Nov. 1869. He was graduated from the University of Pennsylvania in 1819, studied law, and was admitted to the bar in 1821. He commenced the practice of law at Pittsburg, Pa., where in 1823 he attracted attention as the first to suggest Jackson as a candidate for the Presidency. In 1826 he moved to Natchez, Miss., where he soon acquired an extensive law practice; he also became influential in political life, was active in opposing the Nullification movement in 1832-3, and in obtaining the passage of an act by the State legislature denouncing the South Carolina Nullification Act as treasonable. In 1836 he was elected to the United States Senate as a Democrat, where he introduced the first Homestead Bill, supported the policy of Van Buren in regard to the separation of the government from the banks; and persistently advocated gradual emancipation, having freed his own slaves in 1838. He also introduced the resolution recognizing the independence of Texas, and having obtained a strong influence over President Tyler, induced him to take the steps which resulted in the annexation of Texas. He was active at the Democratic national convention of 1844 in obtaining the nomination of Polk; and during the campaign of that year wrote a letter in favor of the annexation of Texas which had a widespread influence. In 1845 he was appointed secretary of the treasury, conducting the affairs of his office with marked ability; in this position he framed the tariff bill of 1846, and was instrumental in establishing the warehouse system, an independent treasury, and in organizing the Department of the Interior. At the close of his term of office in 1849, he engaged in the practice of law in Washington; in 1857 was appointed governor of the Territory of Kansas, but resigned in 1858, being unwilling to aid in forcing slavery upon the Territory. During the Civil War he warmly supported the Union, was sent abroad as financial agent for the United States in 1863, and succeeded in negotiating a loan, and in preventing the sale of an issue of Confederate bonds. After the war he devoted himself to his growing law practice, but continued to hold a position of influence in public affairs, advocating the purchase of Alaska and opposing the impeachment of President Johnson.

Walker, Sears Cook, American mathematician and astronomer: b. Wilmington, Middlesex County, Mass., 28 March 1805; d. Cincinnati, Ohio, 30 Jan. 1853. He was graduated at Harvard College in 1824, taught school near Boston for two years, and in 1827 removed to Philadelphia, where also he engaged in teaching. His parallactic tables, first prepared in 1834, for the latitude of Philadelphia, reduced the time needed for computing the phases of an occultation to less than half an hour. In 1837 he was invited to prepare a plan for the organization of an observatory in connection with the Philadelphia High School, and from its equipment in 1840 until 1852 he published in the 'Proceedings of

the American Philosophical Society' and the 'American Journal of Science' frequent and copious observations and investigations which he had made. In 1841 he published a valuable memoir on the periodical meteors of August and November. In 1845 he took part in the Washington naval observatory, where on 2 Feb. 1847, four months after the detection of the planet Neptune, he made the discovery that a star observed by Lalande in May 1795 must in fact have been this planet. By subsequent alternating computations of Pierce and Walker, the former investigating the perturbations, and the latter the orbit, the theory of Neptune was at once placed on a footing comparable with that of the other large planets. In 1847 he was invited to take charge of the longitude computations of the United States coast survey, an office in which he continued until his last illness. By the joint labors of Walker and Bache the method of telegraphic longitude determinations was developed and successfully carried out as early as 1849, with greater precision than was attained in Europe ten years later. The introduction of the chronographic method of recording observations belongs to Walker and Bache. The prosecution of the telegraphic method of longitude soon led Walker to the discovery that the time required for the transmission of the galvanic signal was measurable, and the velocity by no means as high as had been supposed.

Walker, William, American adventurer: b. Nashville, Tenn., 8 May 1824; d. Trujillo, Honduras, 12 Sept. 1860. After study of law and medicine, he was a journalist in New Orleans and San Francisco, and practised law in Marysville, Cal. In 1853 he organized a filibustering expedition against Lower California and the Mexican state of Sonora. On 4 November he arrived at La Paz, made the Mexican governor a prisoner, and proclaimed a new régime to the inhabitants of Lower California. In a few weeks difficulties arose. Reinforcements did not appear, desertions greatly reduced his force, and he was obliged to retreat across the border into California and surrender himself and band to a detachment of United States regulars. He was tried (May 1854) at San Francisco, for violation of the neutrality laws, and acquitted. But Walker was soon planning new conquests. Taking advantage of insurrectionary troubles in Nicaragua, and to some extent abetted by American capitalists interested there, he landed at Realejo 11 June 1855; and, having with his followers and a few natives won some trifling battles, managed to accomplish a peace which recognized Rivas, leader of the party favored by Walker, as president, and Walker himself as generalissimo. Many Southerners joined him as recruits, and on 1 March 1856 he had, it is said, 1,200 troops. The Pierce administration proclaimed the neutrality laws, and made attempts at prosecution, but expeditions sailed with comparative freedom from San Francisco and New Orleans to Walker's aid. Finally Vill, a priest, the diplomatic representative of what was really the Walker government, was received 14 May 1856, though the North and many conservative Southerners condemned the action. The envoy did not remain long at Washington. Rivas absconded, and in June Walker got himself elected to the presidency. In September he published a decree repealing all laws against

WALKER — WALL-CREEPER

slavery, which had not existed in Nicaragua for 32 years. Undoubtedly he believed that such a procedure would obtain for him valuable support in the slave States. But the United States government declined to recognize him or his ministers, and his arbitrary acts provoked a native insurrection. At last he was held between Lake Nicaragua and the Pacific by an allied army of native Nicaraguans and Costa Ricans, and on 1 May 1857 he gave himself up to Commander C. H. Davis of the United States sloop-of-war *Saint Mary's*, under a treaty of capitulation obtained from Costa Rica. He was taken to New Orleans, and quickly began plotting to organize a new expedition. Arrested for violation of the neutrality laws, he was released on bail, which he forfeited, going with about 200 followers, arms, and supplies to Greytown, where he arrived 25 November. In early December Commodore Paulding, United States Navy, of the *Wabash*, compelled him to surrender. Walker presented himself as a prisoner of state at Washington in January 1858, but President Pierce declined to hold him as a prisoner, on the ground of his illegal apprehension on foreign soil. A. H. Stephens wrote in 1858 that the reason for the opposition to Walker was that "if successful, he would introduce African slavery there" [Nicaragua]. Walker was received with more or less of an ovation in the Gulf States. In October 1858 he sailed again from Mobile, but was arrested at the mouth of the Mississippi, tried at New Orleans, and acquitted. In June 1860, with a small force, he went to Trujillo to stir up revolution in Honduras. His followers were reshipped to the United States, while he was condemned and shot. He published 'The War in Nicaragua' (1860), in justification of his acts. Consult: Joaquin Miller's poem 'Walker in Nicaragua'; Doubleday, 'Reminiscences' (1886); Roche, 'Story of the Filibusters' (1891).

Walker, William Sidney, English Shakespearean scholar: b. Pembroke, Wales, 4 Dec. 1795; d. 15 Oct. 1846. He was educated at Trinity College, Cambridge, becoming a fellow of his college in 1820. Unorthodox views regarding eternal punishment prevented him from taking orders, and accordingly he had to resign his fellowship in 1829. His friend Moultrie edited in 1852 a collection of his 'Poetical Remains,' and W. N. Lettsom compiled from his papers the works entitled 'Shakespeare's Versification, and its Apparent Irregularities explained by Examples from Early and Late English Writers' (1854); and 'A Critical Examination of the Text of Shakespeare, with Remarks on his Language and that of his Contemporaries, together with Notes on his Plays and Poems' (1860), which are of the utmost value to students of Shakespeare and Elizabethan literature.

Walker, Williston, American church historian: b. Portland, Maine, 1 July 1860. He was graduated from Amherst College in 1883 and from Hartford Theological Seminary in 1886. He was professor of church history at the latter institution 1889-1901, and since 1901 has held a similar post at Yale University. He has published: 'The Creeds and Platforms of Congregationalism' (1893); 'A History of the Congregational Churches in the United States' (1894); 'The Reformation' (1900); 'Ten New England Leaders' (1901).

Walker's Battery, in electricity, a battery in which the electro-negative plate is gas graphite or platinized graphite. It is excited by dilute sulphuric acid. See **BATTERY**.

Walkerton, wà'kér-tôn, Canada, capital of Bruce County, Ontario, 65 miles northwest of Guelph, on the Saugeen River, and on the Wellington, Grey & Bruce railroad. It is a thriving and growing town, with extensive water power, several mills, iron foundry, and other industrial establishments. Pop. (1901) 2,971.

Walkerville, wà'kér-víl, Canada, a town of Essex County, Ontario, on the Detroit River, two miles northeast of Windsor, near the outlet of Lake Saint Clair. It has ship-building yards, a distillery, and other industrial establishments. Pop. (1901) 1,595.

Walkill River. See **WALLKILL**.

Walking Delegate, an official connected with a trade union, whose duty it is to visit the various places at which members of his craft are employed, and personally ascertain that no laws of that particular trade guild are infringed by the workmen; also, in cases where an unexpected strike has been ordered by the executive board, it devolves on him to notify men connected with the union to cease work. See **UNIONISM**.

Walking-fish. See **SERPENT-HEAD**.

Walking-leaf. See *Filicales* (6), under **FERNS AND FERN ALLIES**; **LEAF-INSECT**.

Walking Purchase, The. In 1682 William Penn (q.v.) purchased of the Delaware Indians, a tract of land in the present counties of Bucks and Northampton, Pa., bounded on the east by the Delaware River, and in the interior at a point as far as a man could walk in three days. Penn and a party of Indians started on the walk, beginning at the mouth of Neshaminy Creek. At the end of a walk of a day and a half Penn concluded that it was as much land as he wanted and a deed was given to the lands at that point—about 40 miles from the starting place. In 1737 after Penn's death the tract was increased by a party of expert walkers to a point 70 miles in the interior instead of 40 miles. See **DELAWARE INDIANS**; **PENN, WILLIAM**.

Walking Stick, or **Stick-insect**, a wingless orthopterous insect of the family *Phasmida*, so called because in its slender, elongated form and greenish-gray hue, it resembles a dry twig so closely as easily to be mistaken for one when not moving. This is doubtless of great service to these insects as a protection against birds and other enemies which easily overlook them. Some species are several inches long. They are near relatives of the mantids, and are natives of sub-tropical and the warmer temperate regions, and walk gently among the branches of trees, reposing in the sun, with their long antennæ-like legs stretched out in front. They feed upon the green parts of plants, but are rarely numerous enough to do much damage. Consult Howard, 'The Insect Book' (New York 1901). See **ARALIA**.

Wall-creeper, a small bird (*Tichodroma muraria*) of the European Alps, which frequents walls and perpendicular rocks in preference to trees, on whose rough trunks its relatives, the creepers (*Certhia*) make their living. It is

WALL DECORATION—WALL PAPER

about six inches long; plumage light gray, with bright crimson on the shoulders, the larger wing coverts, and the inner webs of the secondaries; the rest of the wings black; tail black, tipped with white. Called also spider-catcher.

Wall Decoration. See MURAL DECORATION.

Wall-eyed Pike, or **Glass-eye**, one of the pike-perch (*Stizostedion vitreum*) of the central part of the United States, so called in reference to its large staring eyes; also absurdly called salmon or jack-salmon in some parts of the South. Its body is elongate, back arched, head subconic, long; cheeks, gill-covers and top of head more scaly; dorsal spines high; dark olive, mottled with brassy; sides of head vermiculated; first dorsal fin with a large black patch on the hinder margin. Length one to three feet. It reaches its greatest development and abundance in the Great Lakes region and upper Mississippi, but is also found southward, eastward and northward to Georgia, Pennsylvania and Assiniboia, respectively. In lakes it inhabits the deep holes or areas where the bottom has been scoured by inflowing streams. In rivers it loves to hide under logs and rocks in the deep holes beneath dams and falls and amid swiftly flowing waters. It is a predaceous fish and devours all smaller species. The wall-eyed pike is a prolific spawner and great numbers of the fish congregate on shallow, well-cleaned bottoms for this purpose. Because of the fine quality of its flesh and the large size (10 to 30 pounds) which it attains, this fish is highly valued, and in the Great Lakes region ranks next to the white-fish in commercial importance. The smaller sand-pike or sauger (*S. canadense*) has a similar but less extended distribution and similar habits. Consult Jordan and Evermann, 'American Food and Game Fishes' (New York 1902).

Wall-flower, a cruciferous herb (*Cheiranthus cheiri*) of southern Europe, where it blooms on rocky cliffs and walls. The plant itself is not handsome, having crowded, twisted, lanceolate leaves, but is cultivated for the sake of its flowers, which are large and in short, head-like, terminal racemes. The petals are four-clawed and spreading, have a velvety surface, and range in color through all shades of yellow and orange to a rich mahogany-brown. They are frequently variegated with these hues, and might be the "streaked gilly-flowers, which some call nature's bastards," scorned by Perdita, of the 'Winter's Tale.' One of their common names, moreover, is gilly-flowers or wall-gilly-flowers. Wall-flowers are biennials, blooming from early spring until autumn, and are offered for sale in French and English cities during the winter. They have a strong and delicious odor of violets.

The native wall-flower of Australia is a leguminous plant (*Pultenaea daphnoides*). In the United States, a cruciferous plant of dry plains, with orange-yellow large flowers, is known as the western wall-flower (*Erysimum asperum*).

Wall Paintings. See MURAL PAINTINGS.

Wall Paper, or **Paper Hangings**, called by the French *papier teint*, ornamental colored paper affixed to the walls of houses as a substitute for the ancient tapestry hangings. The Chinese appear to have employed paper for this use from time immemorial, and the English claim to have

first introduced the practice into Europe. On the other hand, the French assert that printed paper hangings were first made at Rouen as early as 1620 or 1630 by one François, and that the art was perfected in the latter part of the 18th century by Reveillon in Paris. It has certainly prospered more in France than in any other country; and so much taste and skill have there been developed in the manufacture, that the French papers have been sought for in preference to all others. In Paris are numerous factories of paper hangings, employing more than 3,000 workmen; in Lyons are three establishments, and one each at Mulhouse, Strasburg, and Metz. Others are found in Belgium, Germany, Holland, England, and Russia. In the United States the first wall paper factory was established in 1790 by John B. Howell at Albany, N. Y. Paper was at that time made only in sheets, and had to be joined before being printed. Color was then applied by means of a brush to form the background of the design, and the latter was subsequently printed upon the paper from wooden blocks, as many blocks being used as there were colors in the pattern, each block having a part of the pattern upon it in one color. One block was printed the whole length of the paper before the next color was applied. It should be stated that this method of printing by means of blocks still prevails, but only in connection with designs which, on account of their dimensions, or through some other peculiarity, cannot be printed on the cylinder-machines that have practically supplanted block or hand work, as it is termed. The method of applying color to the background by means of a hand-brush has, however, been done away with altogether. It does not appear that any other factories were established until about the year 1810, at which time a man named Boriken was engaged in the business. The Howell firm had meanwhile sold out their Albany business to Lemuel Steel, and, after a short experience in New York and Baltimore, had finally, in the year 1820, located at Philadelphia, Pa., where they have been established ever since, the present owners comprising the third and fourth generations engaged in the business. It was not, however, until 1844 that any decided advance was made in the growth of the industry. About that time paper in continuous lengths came into more general use, and the necessity of joining sheets together was obviated. In that year, also, the first machine for printing wall paper was imported from England and introduced into the Howell factory. While very crude, as it printed only a single color, it had a stimulating effect on the business, inasmuch as it enabled goods to be produced at a largely reduced price, and increased the volume of the business considerably. As near as can be ascertained, the entire production of wall paper in the United States at that time did not exceed \$250,000. The second printing apparatus was imported from England in 1846, this one printing six colors. Machines were subsequently built in this country, at first by the machinists connected with wall paper factories, but after a time a specialty of this class of work was made by William Waldron of New Brunswick, N. J. The printing-machine of to-day is unquestionably a great improvement on that originally imported into this country, although the princi-

WALL OF SEVERUS — WALLA WALLA

ple of its operation is practically the same. It is cylindrical in shape. The paper passes over the cylinder, the pattern being printed on it by means of rollers on which the design has been placed, each roller representing one of the colors used in the design. These rollers are registered so accurately that as the paper, in passing over the revolving cylinder, reaches one of them, it leaves the impression on the paper, and the succeeding rollers follow in regular order. The paper is hung up by an automatic process as it leaves the machine, and passes into drying-racks which are usually several hundred feet in length, after which it is rolled up in lengths of 8 to 16 yards, and is ready for market.

While the printing-machine is necessarily the most prominent feature of the business, yet other factors have contributed largely to the progress made by this industry. Among them are the grounding-machines, which furnish the background color to the paper; the bronzing-machines, which apply bronze powders to certain of the goods; the embossing-machines, which give various textures to the goods after they have been printed; the pressing-machines, which are used to make goods showing the design in relief; the machine or contrivance that is used to hang up the paper after it leaves the printing-machine; and a host of similar devices that enable the manufacturer to produce novel effects and manufacture the goods more rapidly than before, and at a lessened expense. It is these contrivances that have led to the tremendous progress achieved by this industry in the last 60 years, and more particularly within the last 30 years (the pace having been accelerated each year), which have enabled us to become independent of foreign manufacturers, and, notwithstanding a reduction of duties on wall paper, have caused a continued falling off in imports, so that at the present time importations of wall paper are simply nominal.

The improvements were such as were called for by the exigencies of the moment, slight at the time, but cumulative, and enabling the industry eventually to attain its present state of perfection. The most notable are as follows: (1) Soon after the introduction of the printing-machine one McKernan invented a contrivance for festooning the paper automatically as it leaves the printing-machine and passes on to the drying-racks. This was undoubtedly a long stride in the process of making wall paper, inasmuch as the speed of the printing-machine could be increased to the full capacity of the drying-racks connected with it. (2) The single (or continuous) process of making wall paper was introduced about the year 1870. Formerly the ground color had to be applied by one machine, after which the paper was dried and rolled up and next passed through the printing-machine to receive the impressions of the design thereon. In the continuous process the paper passes through the machine which applies a ground color for the design, and then passes through a drying apparatus that is termed a "hot box," or into drying-racks, and then automatically passes into the printing-machine which applies the colors of the design, saving a double handling of the goods and involving less waste. (3) The method of applying bronze powders to wall paper automatically was introduced about the year 1872, although, as it was conducted in se-

cret for some time by one or two firms, the discovery may have been made at an earlier date. This method reduced largely the cost of making bronze (otherwise termed gold) papers, and led to an increased demand and output of them. (4) The next and most recent discovery was the application to wall paper of bronze powders in a liquid state; that is, mixed with an adhesive material (made from potato-starch) of sufficient density to keep the bronze powders in solution without impairing their lustre. This was first placed upon the market about 1882, and as the new process enabled the use of as many different shades of bronze as there were colors in the design, the opportunity was afforded for producing many new and brilliant effects, and for superseding in a large measure bronze or gold goods made by the former method. While the mechanical part of the business has made vast strides, there is yet another feature that outranks it in importance, and that is the artistic element. The American people have a constant craving for something new, and the manufacturer is taxed to the full extent of his powers to satisfy this demand. On no industry does this demand fall more heavily than on wall paper manufacture, and by no occupation has the demand been more fully satisfied.

Wall of Severus. See **HADRIAN'S WALL**.

Wall Street "Corners". Since 1835 the famous corners in the American stock market have been as follows:

YEAR	Stock	Start'g price	High price

Wall-tiles. See **TILE**.

Walla Walla, wō'ā wō'ā ("rushing water"), a tribe of the Shahaptian stock of North American Indians, formerly occupying the country about the lower Walla Walla River, and along the east bank of the Columbia River from the Snake nearly to the Umatilla, in Washington and Oregon. Their language resembles that of the Nez Percés. By treaty of 1855 they were assigned to the Umatilla reservation in Oregon, where they numbered 525 in 1901. See **SHAHAPTIAN**.

Walla Walla, Wash., city, county-seat of Walla Walla County, on the Walla Walla River, 28 miles east of the Columbia River, and on branch lines of the Northern Pacific and the Union Pacific R.R.'s; 150 miles southwest of Spokane. A United States fort was established near the site of the city in 1857, and around this fort grew up a trading post and settlement; it was first called Steptoeville, but when the town was incorporated in 1859 the name of Walla Walla was adopted. It was first incorporated as a city in 1862, and received a second charter in 1884. The city is situated about 15 miles west of the Blue Mountain range, at an altitude of 1,060 feet; it is surrounded by the beautiful and fertile Walla Walla Valley, over 100 miles in length, forming a part of the "Inland Empire" between the Rocky and Cascade ranges, and

WALLABY — WALLACE

consisting of a belt of agricultural land, the larger part under cultivation, which yields large crops of wheat, oats, and barley, as well as vegetables and fruits. In this valley the city of Walla Walla is the centre of trade, and it has become one of the most important commercial cities of the eastern part of the State. It contains an extensive plant for the manufacture of farm machinery and implements and other manufacturing establishments, including gas and electric power works with important improvements under way (1904), two flouring mills, and lumber mills; and has five banks, of which two are national banks. Among its notable public institutions are the United States Land Office, United States District Court, an Odd Fellows' home for the State of Washington, the Stubblefield home for indigent widows and orphans, with \$135,000 of perpetual endowment, and two hospitals. Fort Walla Walla joins the city on the west, and six miles to the west is the monument to the memory of the martyred pioneer and patriot, Marcus Whitman. Walla Walla is also of importance as an educational centre; it has a public library and an excellent system of public schools, including a large high school, and is the seat of the far-famed Whitman College and Academy, a Roman Catholic seminary for girls and an academy for boys, and the St. Paul's seminary for girls (Protestant Episcopal), while Walla Walla College is located two miles outside the city near the fort. The city has an excellent supply of pure water from mountain streams, and a first-class system of waterworks owned and operated by the municipality. The government is vested in a mayor, elected annually, and a council of seven; the city officials are mostly elected by popular vote. Pop. (1890) 4,709; (1900) 10,049; (estimated, government report, 1903) 11,651. Consult Lyman, 'History of Walla Walla County' (1901).

HOLLON PARKER.

Wal'aby, a native name applied to various small kangaroos (q.v.), especially those called brush-kangaroos, which frequent dense scrub-jungle and have great leaping powers. One of the largest species is the red-necked (*Macropus ruficollis*), which is 40 inches or more long, with a tail 30 inches in length; it is South Australian, and is represented in Tasmania by the smaller Bennet's wallaby. Several other species occur in Australia and Borneo, one of which (*M. thediti*) is very common and known to the colonists as pademelon (q.v.).

Wallace, wŏl'ās, **Alfred Russel**, English naturalist and philosopher; b. Usk, Monmouthshire, 3 Jan. 1823. He was educated at Hertford Grammar School, and afterward articled to a land surveyor and architect. Later when resident at Leicester as English master at the collegiate school he made the acquaintance of Henry Walter Bates, like himself an enthusiastic entomologist, and in April 1848 the two sailed from Liverpool on a journey to the Amazon Valley, which marks an epoch in scientific travel. They ascended the Tocantins in August 1848, and in the following year ascended the Amazon. In March 1850, they separated, Wallace taking the basin of the Rio Negro for his ground and Bates that of the Solimões or Upper Amazon. Wallace returned to England in 1852, and in 1853 published 'A Narrative of Travels on the Amazon and Rio Negro.' An-

other result of this journey was a small work on 'Palm-Trees of the Amazon and their Uses' (1853). Of still greater importance to the progress of modern biological geography and philosophy was his eight years' residence (1854-62) in the islands of the Malay Archipelago, because it led him to the formulation of his theory of natural selection, and produced that scientific classic, 'The Malay Archipelago, the Land of the Orang-Utan and the Bird of Paradise: a Narrative of Travel, with Studies of Man and Nature' (1869). His natural selection theory was contained in a paper 'On the Tendency of Varieties to Depart Indefinitely from the Original Type,' which he sent to Mr. Darwin in 1858, and on 1 July of that year it was read at a meeting of the Linnæan Society with a statement of the practically identical theory which Darwin had been elaborating independently for many years. His work in Malaysia is fittingly commemorated by the application of his name to the imaginary line (Wallace's Line) between Bali and Lombok, which, as he showed, marked the boundary between an Asiatic and an Australian fauna in the archipelago. In 1870 he published 'Contributions to the Theory of Natural Selection,' and in 1876 issued the first thoroughly scientific treatise on zoogeography, 'The Geographical Distribution of Animals, with a Study of the Relations of Living and Extinct Faunas as elucidating the Past Changes of the Earth's Surface.' This subject was further developed in the more popular work, 'Island Life, or the Phenomena and Causes of Insular Faunas and Floras, including a Revision and attempted Solution of the Problem of Geological Climates' (1880). 'Tropical Nature and other Essays' (1878) contains suggestive papers on sexual selection, color in nature, and similar subjects, and was reissued, with modifications and additions, in one volume with 'Contributions to the Theory of Natural Selection' in 1891. In 'Darwinism: an Exposition of the Theory of Natural Selection, with some of its Applications' (1889), he gives a final and masterly statement of the theory of organic evolution as he conceives it, with abundant illustrations from his first-hand knowledge of the facts. He stands by pure Darwinism, refusing to admit the additional elements, such as sexual selection, which Darwin himself adopted in his later works. He refuses to extend evolution to the development of mind, and he adopts Weismann's views on heredity. In short, he holds by organic evolution only in so far as it is consistent with or required by a spiritual interpretation of man and nature.

Wallace's work has been by no means confined to natural history. In 1866 he issued a work on 'The Scientific Aspects of the Supernatural'; and in 1875 gave in 'Miracles and Modern Spiritualism' a full statement of his spiritualistic faith. He issued in 1885 a pamphlet entitled 'Forty-Five Years of Registration Statistics, proving Vaccination to be both Useless and Dangerous.' He gave evidence before the recent Royal Commission on the subject, and in 1898 published 'Vaccination a Delusion, its Penal Enforcement a Crime,' in which he endeavored to prove that the majority report of the commission is opposed to the best evidence laid before it. In 'Land Nationalization: its Necessity and its Aims' (1882) he compares the landlord-and-tenant system of land tenure with

WALLACE

an occupying tenancy under the state, and strongly advocates the latter. A Land Nationalization Society, of which he is president, has been formed to disseminate the principles of his book. 'Bad Times: an Essay on the Present Depression of Trade' (1885) is another contribution to economics. He prepared the volume 'Australasia' (1879) in Stanford's 'Compendium of Geography and Travel,' and to the new issue contributed the first of the two volumes on Australasia, dealing with Australia and New Zealand (1893). In 1898 he published 'The Wonderful Century, its Successes and its Failures,' a review of the 19th century; and in 1901, 'Studies, Scientific and Social.' He was awarded the Royal Medal of the Royal Society in 1868, the Gold Medal of the Société de Géographie in 1870, the Darwin Medal of the Royal Society in 1890, the Founder's Medal of the Royal Geographical Society, and the Gold Medal of the Linnean Society in 1892; and from 1881 received a Civil List pension of £200 per annum.

Wallace, David Duncan, American historian: b. Columbia, S. C., 23 May 1874. He was graduated at Wofford College, Spartanburg, S. C., in 1894, where he became professor of history and economics in 1899. He has published 'Constitutional History of South Carolina, 1725 to 1755' (1899), and several historical monographs.

Wallace, Sir Donald Mackenzie, English writer: b. 11 Nov. 1841. He was educated at the universities of Edinburgh, Berlin, and Heidelberg, and at the Ecole de Droit, Paris. He was private secretary to the viceroy of India in 1884-9, attended the czar's wedding during his tour in India and Ceylon in 1890-1, was director of the foreign department of the *Times* in 1891-99, and was assistant secretary to the Duke of Cornwall and York on his colonial tour in 1901. He has published 'Russia' (1877); 'Egypt and the Egyptian Question' (1883); 'The Web of Empire' (1902); etc.

Wallace, John Findley, American civil engineer: b. Fall River, Mass., 10 Sept. 1852. He was educated at Monmouth College and the University of Wooster, and in 1869-70 was engaged in railway service. In 1871 he became assistant engineer of the United States Engineers, and was appointed county surveyor and city engineer in 1878. He has been engaged as chief engineer and superintendent on various railroads since 1879, and since 1891 has been with the Central Railroad, becoming general manager of the Illinois Central system in 1902.

Wallace, Lewis (better known as 'Lew'), American soldier and author: b. Brookville, Franklin County, Ind., 10 April 1827. He studied law; at the beginning of the Mexican war enlisted as a lieutenant in the 1st Indiana infantry; in 1848 began professional practice, which he carried on at Covington, Ind., and Crawfordsville, Ind., and for four years was in the State senate. At the outbreak of the Civil War he was appointed adjutant-general of Indiana and soon afterward colonel of the 11th Indiana volunteers; on 3 Sept. 1861 was made a brigadier-general of volunteers; and for ability displayed in leading a division at Fort Donelson (q.v.) was made major-general of volunteers 21 March 1862. He participated in the second day's fight at Shiloh, and in the advance on Corinth; was

president of the court of inquiry regarding Don Carlos Buell (November 1862); in 1863 prepared the Cincinnati defenses, and later was made commander of the Eighth army corps, with headquarters at Baltimore. At the battle of the Monocacy (9 July 1864) he was defeated, but detained the enemy until Wright, with reinforcements, could reach Washington before Early. In 1865 he resumed law practice; in 1878-81 was governor of New Mexico, and in 1881-5 was minister to Turkey. His published writings are: 'The Fair God' (1873); 'Ben Hur' (1880), a religious story that has sold very extensively and made him well known in general literature; a 'Life' of Benjamin Harrison (1888); and 'The Prince of India' (1893).

Wallace, William, American manufacturer: b. England 1825; d. Washington 20 May 1904. Early in life he came to the United States with his father and established the firm of Wallace & Sons at Ansonia, Conn., which soon became one of the leading manufactories of copper and brass alloys in the United States, and Mr. Wallace came to be considered one of the leading authorities in the country on the alloys of copper, zinc, and tin. Becoming associated with Moses G. Farmer (q.v.), they began the manufacture of a compound telegraph wire, consisting of a steel core and an electrolytically deposited copper covering, thus giving conductivity and strength, combined with lightness. In 1876, at the Centennial Exhibition, he brought out the Farmer-Wallace dynamo machine, with which the buildings were successfully lighted, being the earliest general electric lighting in this country. A year or two later he devised a plate arc lamp for use with this machine, by means of which a number of arc lights could be placed in series on the circuit, thus originating the series method of arc lighting. For several years before his death he lived at Washington, engaged in scientific investigation, especially in work with the microscope.

Wallace, Sir William, Scottish patriot and hero: b. probably Elderslie, Renfrewshire, about 1272; d. London 24 Aug. 1305. Owing to the want of contemporary Scottish records, the real facts regarding his life and achievements remain in much obscurity, many incidents resting solely on the authority of Blind Harry, who wrote about 200 years later, and can hardly be regarded as a serious historian. Wallace is represented as having been for some years engaged in a partisan war against the English before what is represented by Blind Harry as the turning-point in his career took place, the burning of the town of Lanark and the murder of Hezlerig, the sheriff. This incident is ascribed to May 1297. Soon after, he attacked Ormesby, the justiciar, while holding a court of justice at Scone, and Bek, bishop of Durham, at Glasgow, whom he put to flight. Among the followers of Wallace about this time was William of Douglas, the representative of a great Border family, which subsequently contributed invaluable aid to the war of independence. Sir Henry Percy and Sir Henry Clifford were sent to repress the Scottish rising. Wallace took most of the northern fortresses, and was besieging the Castle of Dundee, when he heard that the enemy was advancing upon Stirling. He took up a position encompassed by a loop of the Forth in front of the Abbey Craig, a hill near the Abbey of Cambuskenneth. Sur-

WALLACE — WALLACK

rey determined to attack him, and the English crossed the Forth on a narrow bridge from early morn till near noon, while the Scots were drawn up as spectators of their passage on the hill (11 Sept. 1297). When Wallace deemed the enemy sufficiently divided he attacked those who had crossed with his whole force, sending at the same time a detachment to secure and hold the head of the bridge. The victory was complete. Cressingham was killed, and Surrey fled to Berwick. After this Wallace appears with the title of guardian of the kingdom, which was temporarily cleared of the English, and is found conducting an invasion, or series of organized raids into England. In 1298 Edward entered Scotland with an army estimated at 7,000 men-at-arms and 80,000 footmen. Wallace retired before him, wasting the country, but was at length overtaken at Falkirk in a position where he was compelled to fight. He drew up his army on an inclined plain with his horsemen, about 1,000, in the rear (22 July 1298). The footmen were arranged in circles, the bowmen in the centre, and the spearmen in the front rank kneeling. In this order they resisted for a time the attacks of the English men-at-arms, but the circles were gradually broken, and the army routed. After this Wallace for a time disappears from the scene. The council of regency which succeeded him carried on the war for some time with spirit; but on 9 Feb. 1304 they and their followers were admitted to King Edward's peace. Wallace was excepted by name. He was then in the country, and every exertion was made to secure his apprehension. It was effected through Sir John de Menteith, governor of Dumbarton Castle. He was conveyed to London, through which he was carried on 22 Aug. 1305. He was put on trial at Westminster before a special commission, and was executed for treason and rebellion, though he had never recognized Edward, and the latter explicitly claimed dominion over Scotland as a conqueror only. He appears in literature in Porter's 'Scottish Chiefs' (1810), and Buchanan's 'Wallace: A Tragedy' (1856). Besides the histories of Scotland and others relating to the period consult the biographies by Carrick (3d ed. 1840); Tytler (2d ed. 1845); Moir (1886), and Muirson (1808); the edition of Blind Harry by Jamieson (1820); and Stevenson, 'Wallace Papers' (1842).

Wallace, William Harvey Lamb, American soldier: b. Urbana, Ohio, 8 July 1821; d. Savannah, Tenn., 10 April 1862. He removed with his father to Illinois in 1833, studied law and in 1846 was admitted to the bar. At the outbreak of the Mexican war he enlisted as a private, later becoming adjutant, and served at Buena Vista and in other operations until the end of the war, when he returned to his law practice. He became district attorney in 1853 and in 1861 he was appointed colonel of volunteers in the Union army. He commanded a brigade at Fort Donelson, February 1862, was promoted brigadier-general, and in the battle of Shiloh commanded Smith's old division. The brigade withstood an assault of six hours and was last to leave the field, Wallace falling, mortally wounded, in the resistance.

Wallace, William Vincent, Irish musical composer: b. Waterford 1 July 1813; d. Château de Bagen, in the Pyrenees, France, 12 Oct. 1865. He gave evidence of great musical ability, be-

came a skilful player on several instruments, and in 1829 was organist in Thurles cathedral. His enthusiasm was stimulated by hearing Paganini play in 1831, and in 1834 he played a violin concerto composed by himself. He went to Australia in 1835 and worked at sheep-farming. But soon returned to music, and traveled to New Zealand, where he had a romantic escape from assassination by the Maoris. His later travels proved very profitable from a financial point of view. He returned to London in 1845, and toward the end of that year his popular opera of 'Maritana' was produced at Drury Lane with great success. 'Matilda of Hungary' (1847) was damaged by an exceedingly bad libretto. After a voyage to America he again settled in England in 1853, and in 1860 'Lurline,' a better work than 'Maritana,' was produced with even greater success at Covent Garden. Other operas were the 'Amber Witch' (1861); 'Love's Triumph' (1862); 'The Desert Flower' (1863); and 'Estrella,' the last left unfinished at his death.

Wallace's Line, an imaginary line, so called in compliment to Alfred Russel Wallace (q.v.), separating the Oriental from the Australian faunas. It passes between the Sulu and Philippine Islands, along the Straits of Macassar and between Lombok and Java. The fauna west of this line is strikingly different from that east of it, although the opposite shores of dividing waters are sometimes only a few miles apart. See ZOOGEOGRAPHY.

Wallachia, wō-lā'kī-a, southern Europe, a former principality, united with Moldavia in 1861 to form the kingdom of Rumania. See RUMANIA.

Wallachian, or **Cretan, Sheep**, a variety of long-haired domestic sheep, bred in Wallachia and its neighborhood, remarkable for the development of the horns. The horns of rams spring almost perpendicularly from the frontal bone, and then take a beautiful spiral form; and those of the ewes protrude nearly at right angles from the head and then become twisted in a singular manner. The disadvantage of such head-appendages has led to the diminution rather than the increase of the breed.

Wallack, wōl'ak, **James William**, American actor: b. London 24 Aug. 1795; d. New York 25 Dec. 1864. He made his first appearance on the stage when a child. In 1813 he began his permanent career, playing as Laertes in 'Hamlet' at Drury Lane. He made his first visit to the United States in 1818, and subsequently for 20 years lived alternately in England and in the United States, playing at different times in all the principal cities of the Union. In 1820 he became stage manager at Drury Lane, and in 1837 opened the National theatre in New York. This was destroyed by fire in 1839, and in 1852 he opened Wallack's Lyceum, rebuilt as Wallack's theatre in 1861. His career as actor and manager was uniformly successful and in the presentation of comedy he had few equals. As a manager he was greatly aided by his knowledge of stage-effects and his artistic adaptation of scenery and costumes. Consult: Lester Wallack, 'Memories of Fifty Years' (1889).

Wallack, John Lester, American actor, son of James William Wallack (q.v.): b. New York 1 Jan. 1820; d. Stamford, Conn., 6 Sept.

1888. He made his début as an actor in New York in 1847, succeeded his father as manager of Wallack's theatre, New York, in 1864, and conducted it with great success. He adapted several French comedies to the American stage, and in 1888 retired after having been identified with the American stage as actor and manager for 40 years. Consult his 'Memoirs of Fifty Years' (1889); Mackay and Wingate, 'Famous American Actors of Today' (1896).

Wallasey, wŏl'a-sī, England, an industrial town suburban to Liverpool, in Cheshire, two miles northwest of Birkenhead, near the seaward extremity of the Wirral peninsula, protected by the notable Wallasey embankment. The town has a workmen's institute, a 16th century reorganized grammar school, and is noted for its municipal ownership of public utilities, water, gas, electric-lighting, street railways, baths, cottage hospital, etc. Pop. (1901) 53,580.

Wallenstein, vāl'lën-stīn or wŏl'ën-stīn (or more correctly WALDSTEIN), **Albrecht Wenzel Eusebius, Von**, duke of Friedland and Mecklenburg, and Prince of Sagan, German soldier: b. Hermanic, Bohemia, 15 Sept. 1583; d. Eger, Bohemia, 25 Feb. 1634. He studied under the Jesuits at Olmütz, and after accepting the Catholic faith finished his studies at the Universities of Altdorf, Bologna, and Padua. In 1717, on assisting the Archduke Ferdinand in the latter's war against Venice, he was raised to the rank of count and made a colonel. When Bohemia revolted, he raised a regiment of cuirassiers for the emperor and fought against Thurn and Bethlen Gabor. When the estates of the vanquished Bohemians were confiscated in 1620 and sold to imperial adherents at nominal prices, he purchased extensive tracts, including the domains of Friedland and Reichenberg. In 1623 he was made Duke of Friedland, and in 1624 his collective estates were elevated to a principality. He now applied himself to the care of these dominions. When the emperor was involved in new troubles by the Lower Saxon league in 1625 he offered to raise 20,000 men for the imperial service by his own efforts. In return, he was to have full control in the hostile provinces. Before he had completed his levy he was named generalissimo and field-marshal, and then set out at the head of 30,000 men to co-operate with Tilly (q.v.). On 25 April 1625, he gained a victory over Count Mansfeld at Dessau, and when that general proceeded at the close of the year to Hungary to join Bethlen Gabor, he followed and brought Bethlen to conclude a truce. In the campaign of 1627 he conquered Silesia, drove the Danish king out of Germany, and forced his way into northern Jutland, bought from the emperor the dukedom of Sagan, at a price in which his military expenses were reckoned. The estates of Mecklenburg having been forfeited in the war, he was invested in them, first as security for his expenses, and afterwards as a regular fief in 1629. The attempt to take Stralsund was wholly unsuccessful (1628). In 1630, owing to the jealousy of the nobles, Wallenstein was deprived of his command.

When Gustavus Adolphus invaded Germany, Wallenstein attempted to negotiate with him on his own account, but the distrust of the Swedish hero frustrating his intentions, he listened to the earnest entreaties of the emperor, and

again took the field, having procured a formal capitulation securing to himself almost absolute power. After some partial successes he encountered the King of Sweden at Lützen, 16 Nov. 1632, in which battle Wallenstein was defeated and Gustavus killed. After the death of the Swedish king he had reopened negotiations with the enemies of the emperor, by whose assistance he hoped to place himself at the head of affairs in Germany. The matter proceeded slowly as his offers were received with much mistrust, especially by the German princes; he resumed hostilities to make his value felt, then reopened negotiations. His proceedings were known at the court of Vienna; but he was at the head of an army largely consisting of foreigners, many of whose leaders were personally pledged to him alone. The emperor was not strong enough to remove him, and was base enough to have recourse to assassination. On 24 Jan. 1634, he signed a secret patent conferring the command of the army on Count Gallas, who was instructed to arrest Wallenstein and his associates, and throw them into prison. On 18 Feb. an open proclamation was made commanding the army to obey only Generals Gallas, Piccolomini, and others named. Wallenstein left Pilsen with some of his confidential associates on the 23d to take refuge in the fortress of Eger, which he reached on the 24th. Here he was assassinated on the evening of the 25th. The plenipotentiary of Saxony and Brandenburg had reached Zwickau, and the plenipotentiary of France Frankfort, on their way to Wallenstein's headquarters, when they received word of his death. The emperor openly rewarded the assassins, among whom were two Scotchmen and two Irishmen, Gordon, Leslie, Butler, and Devereux. Wallenstein's overtures to the enemies of the empire have been represented by his partisans as *ruses de guerre*.

A vigorous controversy has been waged over the matter. As an organizer and leader of armies he must be ranked among the great commanders. In a time of excessive confusion he maintained a statesmanlike control of difficult affairs. His career was made the basis of Schiller's trilogy of 'Wallenstein.' Consult the lives by Forster (1834); von Ranke (5th ed. 1895); Arctin (1846); Hurter (1855); Forster's ed. of the 'Briefe Wallensteins' (1828-9); Schebek, 'Die Lösung der Wallensteinfrage' (1881); Bilck, 'Beiträge zur Geschichte Wallensteins' (1886); Schulz, 'Wallenstein und die Zeit des dreissigjährigen Krieges' (1898). See THIRTY YEARS' WAR.

Waller, wŏl'ér, **Edmund**, English poet: b. Colehill, Hertfordshire (now in Buckinghamshire), 3 March 1606; d. Beaconsfield 21 Oct. 1687. He was educated at Eton and King's college, Cambridge, and is said to have been returned a member of Parliament for Amer-sham in his 16th year. In 1625 he was returned for Chipping Wycombe, and he sat for other places in several parliaments, including the Long Parliament. On the death of his wife in 1634 he courted Lady Dorothea Sydney, whom he celebrated in his verses under the name of 'Sacharissa', and Lady Sophia Murray, whom he distinguished by the name of 'Amoret,' both without success. In Parliament he at first opposed the court party, but retained his place

in the Long Parliament, and openly expressed his royalist sentiments after the Civil War began. He was sent as a commissioner from Parliament to the king after Edgehill, and soon after this occurred the incident called Waller's plot. Its nature is not clearly understood, though Waller made an abject confession of all he knew, including the names of his confederates, some of whom, his near relatives, were put to death. This event in his life is introduced in Beatrice Marshall's story 'An Old London Nosegay' (1904). He was imprisoned for a year, fined £10,000, and exiled. During this exile the first collection of his poems was published in 1645. In 1653 he obtained permission from Cromwell to return to England, and in 1654 he addressed a 'Paenegyric to the Lord Protector.' In 1656 he recommended him in another poem to assume the royal title. Shortly after a poem on the death of the lord-protector, he addressed one to the king on his majesty's happy return. The proceedings of Monk apparently had not been anticipated. He again sat in Parliament, at intervals of cessation, till the reign of James II. Burnet says his popularity in Parliament was great, but he did not take pains to understand its business, but only studied to gain applause, being a vain and empty, though a witty man. His poetry was celebrated for elegance and polish at a time when these graces had been comparatively little studied, but it is destitute of all great qualities. Consult: Gosse, '17th Century Studies' (1897).

Waller, Frank, American artist and architect: b. New York 12 June 1842. He was educated at the Free Academy in New York, studied art in Rome (1870-71), and the next year made a sketching tour in Egypt. He was a founder and the first president of the Art Students' League and since 1888 has devoted his attention to architecture. Among his paintings may be cited 'Tombs of the Caliphs' (1874); 'A Caravan in the Desert' (1878); 'Eventide: Venice' (1883); 'Hop Picking' (1885). He published 'Report on Art Schools' (1879).

Wallin, väl-lên', Johan Olof, Swedish poet and ecclesiastic: b. Dalarna, Sweden, 15 Oct. 1779; d. Upsala, Sweden, 30 June 1839. He studied at Upsala and in 1806 was pastor of the Royal Military Academy. He subsequently held pastorates at Solna, Ulriksdal and Vesteras, and in 1837 was made Archbishop of Upsala. His hymns and religious songs are in high repute in Sweden, and he was called by Tegnér 'David's Harp of the North.' Among his poems are 'The Educator,' a didactic poem in Alexandrines; verses on George Washington, 'Homesickness' and 'The Angel of Death,' one of his best known poems. He was a notable pulpit orator. His collected works in two volumes appeared in 1878.

Wallingford, wöl'ing-förd, Conn., borough, New Haven County; on the Quinipiack River, and on the New York, New Haven & Hartford Railroad; about 22 miles south of Hartford and 12 miles north of New Haven. The borough has broad, regularly laid-out streets, lined with large elm trees. The chief manufacturing establishments are sterling silver, silver-plate and nickel works, rubber goods factory, and brass goods factories. Britannia and iron-ware

are among the manufactures. The government census of 1900 gives the number of industrial establishments of the whole town (which includes two villages, East Wallingford and Yalesville, besides the borough) as 73; the capital in plants, \$5,382,134; the number of wage earners, 2,270; amount paid each year in wages, \$1,160,551; amount paid annually for raw material, \$2,813,410; average annual value of products, \$5,238,280. The town is one of the oldest settlements in Connecticut; it received its present name in 1670. In 1850 a branch of the Oneida Community (q.v.) was located here. The property is now owned by the Free Masons and the State Masonic Home has been erected here. There are two banks; the national bank has a capital of \$150,000, and the two banks have deposits amounting to \$864,890. There are six churches, a public high school, The Phelps School for Girls, a number of graded schools, and a public library. Pop. (1880) 3,017; (1890) 4,230; (1900) 6,737. The population of the town is, (1890) 6,584; (1900) 9,001.

Wallingford, Vt., a town in Rutland County, on Otter Creek and the Bennington & Rutland Railway, 9 miles south of Rutland, 59 miles southwest of Montpelier, and about 11 miles southwest of Killington Peak. Included in it are the villages of Wallingford, South Wallingford, and East Wallingford. It has 2 hotels, 4 churches, a public high-school, and manufactures of harness, tinware, coffins and caskets, and agricultural implements. Pop (1890) 1,733; (1900) 1,575.

Wallis, wöl'is, John, English mathematician: b. Ashford, Kent, 23 Nov. 1616; d. Oxford 28 Oct. 1703. He was educated at Emmanuel College, Cambridge, took holy orders, and in 1641 became chaplain to a Yorkshire baronet. He was one of the first members of the scientific association which became later the Royal Society, and in 1649 was appointed Savilian professor of geometry at Oxford. He was particularly skilful in the art of cryptography, or deciphering; and having by this means been enabled to render considerable service to the royal cause, he was on the Restoration of Charles II. made one of the royal chaplains. In 1661 he was one of the divines appointed to revise the Book of Common Prayer; and when the Royal Society was founded in 1663 his name was included in the list of the earliest members; and he added much to the reputation of that body by valuable contributions to the 'Philosophical Transactions.' Among his mathematical works the most important are: 'Arithmetica Infinitorum'; 'Mathesis Universalis, sive Opus Arithmeticum'; 'Mechanica, sive de Motu Tractatus geometricus'; 'De Sectionibus Conicis Tractatus'; and his 'Algebra.' He also published editions of Archimedes, Ptolemy, Aristarchus, and Porphyry. His complete works, including various treatises on theology, were published at Oxford (1692-9).

Wallis, Sir Provo William Parry, English naval officer: b. Halifax, Nova Scotia, 12 April 1791; d. Funtington, near Chichester, England, 13 Feb. 1892. He entered the British navy as a midshipman in 1804; served against the French, and in the War of 1812 with the United States was second lieutenant on the Shannon. He

WALLIS — WALNUT

was on board this ship in the fight with the Chesapeake and upon the disablement of the captain and death of the lieutenant, Wallis took command and conducted the prize to Halifax, receiving promotion to commander in recognition of his services. He was aide-de-camp to the queen in 1847-51, and in the last named year was promoted rear-admiral. He became vice-admiral in 1857, admiral of the white in 1863, and of the fleet in 1877. Contrary to the usual rule of retirement at the age of 70 Wallis was retained on the active list until his death, and for many years he was the only surviving flag-officer who had fought in the Napoleonic wars and in the war with America in 1812.

Wallis, Severn Teackle, American lawyer: b. Baltimore, Md., 8 Sept. 1816; d. there 11 April 1894. He was graduated from Saint Mary's College, Baltimore, in 1832, and was admitted to the bar in 1837. He became corresponding member of the Royal Academy of History at Madrid in 1843, and in 1849 went to Spain as United States agent to examine the title to public lands in east Florida as affected by the treaty of 1819. He was elected to the Maryland legislature in 1861 and there took a firm stand against action of the North in regard to the Civil War. He was imprisoned by the Federal Government for 18 months together with other prominent Marylanders and then released. He resumed his law practice and in 1870 was elected provost of the University of Maryland. He published: 'Glimpses of Spain' (1849); 'A Discourse on the Life and Character of George Peabody' (1870); etc.

Wallis Archipelago, Pacific Ocean, a group of islands northeast of Fiji, with an area of 40 square miles. They were placed under a French protectorate in 1887, have a French resident, and are in regular communication with Nouméa. Pop. est. 4,500.

Wallkill (wâl'kîl) River, a river taking its rise in Sussex County, N. J., and flowing north and northeast through Orange and Ulster counties, N. Y. About 6 miles from the Hudson it joins the Rondout Creek, and below the junction the stream is sometimes called the Wallkill. The Wallkill is about 120 miles in length and furnishes considerable water-power. Its valley is a well-known dairy section.

Wallon, vâ-lôn, Henri Alexandre, French historian: b. Valenciennes, France, 23 Dec. 1812. He was educated in the Normal School at Paris, and in 1840 was appointed to the chair of modern history and geography at the Sorbonne. He was elected to the Legislative Assembly in 1849 but resigned in the following year; became a member of the National Assembly in 1871; and in 1875-6 was minister of public instruction. The complete establishment of the republic was largely due to his amendment, the 'Amendment Wallon,' carried 30 Jan. 1875, which subsequently gave him the sobriquet 'Father of the Republic.' In 1876 he became a member of the senate. His writings include: 'De l'Esclavage dans les Colonies' (1847); 'Jeanne d'Arc' (2 vols., 1860); 'La Vie de Jésus et son Nouvel Historien' (1864); 'La Terreur, Études Critiques sur l'Histoire de la Révolution Française' (1872); 'Les Représen-

sentants du Peuple en Mission, etc.,' (1793-4; 5 vols., 1888-90): etc.

Walloons, wô-loonz', the inhabitants of the Ardennes plateau, Southern Belgium, who are chiefly of Celtic or Roman extraction, and speak the French language, in distinction to the northern inhabitants of German race and language. The name is probably analogous to that given by the Germans to other foreign races, as the Walachians, Gauls, Welsh, etc. See BELGIUM, *People*.

Walnut, a tree of the genus *Juglans*, and of the order *Juglandacea*. The species, of which about 10 have been described, are natives of the northern hemisphere, being confined to the temperate parts. In America they are found as far south as Mexico. They are characterized by rough bark, compound leaves aromatically fragrant when bruised, staminate flowers in catkins, pistillate flowers in few to many flowered racemes and followed by large drupes with inedible husks and hard nuts, the kernels of which are valued in some species for food, dessert or the oil they yield upon expression. A majority of the species are prized for park planting because of their hardness and the graceful form they acquire when well established. For this purpose the most esteemed in America is probably the black walnut (*Juglans nigra*), which has a range from the New England States to Minnesota and southward to the Gulf States, but has now become rare and costly. It is a graceful and imposing tree which often reaches 150 feet in height, has usually an erect trunk and a broad airy round top. It is also valued to some extent for its rough hard-shelled nuts which are often seen in the markets. Its wood is one of the most highly prized native woods, being used extensively for furniture making, interior finish of houses where "natural woods" are used, its deep brown tint making rich contrasting effects with other woods. Several other species also furnish nuts found in various markets where the trees are native and the husks of several are used for dyeing and tanning. The species most esteemed for its nuts is, however, the Persian or "English" walnut (*Juglans regia*), which is indigenous from China to southeastern Europe. It has been cultivated for centuries in the Mediterranean region, whence it has been taken to mild climates throughout the world. The tree is only about half as large as the preceding species but is much the same in appearance. Its nuts have smoother, softer shells and usually finer flavored kernels. This nut is one of the most important of the world. Only during the closing half of the 19th century, however, has it been grown commercially in the United States, and here only in California. The crop marketed in 1901 from this state was officially estimated at about 6,000 tons, worth a little more than \$1,000,000. Since the planting of orchards has been fairly active in the sections adapted to the tree the yields since that date have increased. In 1903, 825 car-loads were shipped to eastern markets. Besides these home supplies large quantities are imported from the Mediterranean region but these importations will probably dwindle into insignificance when Californian orchards come into full bearing.

Since the trees seem to be exacting in their

demands, the areas in which they can be cultivated are somewhat restricted. They are considered susceptible to frosts after their growth has started though fairly hardy while dormant; they seem to be unable to stand hot weather since the nuts are more or less injured; they seem to fail upon lands in which standing water is nearer the surface than 20 feet, also in soils with hard clay subsoil and in poorly drained soils. They are thus almost restricted at present to the deep alluvial soils of the four southern counties of California, but by planting varieties which vegetate late in the spring and by avoiding the conditions mentioned it is believed that the region of successful cultivation may be extended even into the northern counties. The seeds are planted about 12 inches asunder in nursery rows 4 feet apart, cleanly cultivated, irrigated during midsummer and hardened off by withholding the water in autumn. They will usually be under 2 feet in height when one year old when they are root-grafted to desirable varieties. The grafts will often grow 8 feet during the first year. Either when one year or two years old the plants are set in permanent quarters about 50 feet apart. Little pruning is needed except to correct bad form, the branches being started about 4 feet from the ground. The orchards are kept cleanly cultivated throughout the season, the first plowing in spring being at least 6 inches deep. Irrigation is also given if needed; always during the winter. The trees of even the most precocious varieties rarely produce profitable crops before six years old and ten years is nearer the average age. Trees reach full bearing when about twenty years old and continue for thirty years or more. Some trees in Europe are said to be more than 100 years old. When the nuts begin to fall they are shaken down, gathered by women and children usually and spread on trays to dry for a week. The nuts are then graded into sizes by passing them over sieves after which they are dipped in a bath of soda, chloride of lime and sulphuric acid to bleach the brown shells and give them the ecru tint demanded by the market. After dipping they are rinsed in clear water. Formerly sulphur was used for this purpose but it was found to impair the quality of the nuts and has been abandoned. After drying the nuts are again graded into light and dark. The latter with the broken ones are used by confectioners; the former are shipped to market in sacks holding about 110 pounds.

Consult: U. S. Dept. of Agriculture, Division of Pomology, 'Nut Culture in the United States.'

Walpi. See TUSAYAN.

Walpole, wŏl'pŏl, Horace, EARL OF ORFORD, English wit and letter-writer: b. London 5 Oct. 1717; d. there 2 March 1797. He was the fourth son of Sir Robert Walpole (q.v.). He was educated at Eton and King's College, Cambridge, on leaving which (1739) he traveled two years on the Continent. Returning in 1741 he took his seat in the House of Commons as member for Callington, Cornwall, and he sat for various constituencies up to his resignation in 1767. He always took a lively but superficial interest in politics, inclining sentimentally to extreme opinions. His parliamentary career

requires no particular record, but it may be mentioned that in 1757 he exerted himself earnestly in behalf of Admiral Byng (see BYNG, JOHN). In 1747 he purchased Strawberry Hill, near Twickenham, where he erected a Gothic villa, laid out the grounds with minute ingenuity, and made it a principal business of his life to adorn and furnish it according to a fantastic but refined and educated taste, with objects of curiosity and antiquarian interest, rare prints, pictures, books, and manuscripts. His maintenance was provided for by some sinecure appointments. To his antiquarian taste he added authorship, first in verse and afterwards more extensively in prose, and in 1757 established a private printing-press at Strawberry Hill, at which he printed not only his own works but those of others, his editions often selling at very high prices on account of the small number printed. In 1791 he succeeded his nephew in the peerage. He never took his seat in the House of Lords, and appears to have avoided using his title. His works are numerous. His first publication was a description of Sir Robert Walpole's pictures, printed privately in 1747, under the title of 'Aedes Walpolianæ.' In 1757 a popular satire appeared called 'A Letter from Xo Ho, a Chinese Philosopher at London, to his Friend Lien-Chi, at Peking,' 'Fugitive Pieces in Verse and Prose,' and 'Catalogue of the Royal and Noble Authors of England,' with lists of their works, appeared in 1758. 'Anecdotes of Painting in England' were published in 1762-71. 'The Castle of Otranto' (1764), a romance, regarded as the prototype of the work of the 'School of Terror,' which subsequently became popular, is very variously estimated. Praised by Byron and Sir Walter Scott, it is pronounced by Hazlitt dry, meagre, and without effect. 'The Mysterious Mother,' a tragedy, and 'Historic Doubts on the Life and Reign of Richard III.' appeared in 1768. The works on which his reputation now chiefly rests are his 'Letters,' of which the best edition is that edited by Peter Cunningham (1857-9), and 'Memoirs' and 'Journal,' a series embracing the reigns of George II. and III. from 1751 to 1783. Walpole is almost unanimously pronounced the best of English letter-writers, whose unfailing ease and vivacity in treating of politics, art, foreign affairs and other topics are unlike anything else in English literature. The memoirs are more bitter and cynical, but both are valued as a store-house of the more evanescent traits of contemporary history, being full of passing topics and occurrences, anecdotes, characters, and portraits. Though a keen and able he was not, however, an accurate or impartial observer. Want of depth and earnestness in his own character, his party prejudices, his vanity and love of effect, tempered all he wrote, and detract from the weight of his evidence. Few writers, however, are more uniformly entertaining. Walpole's manners were affected both personally and as a writer. He was as fastidiously aristocratic in his personal notions as he was sentimentally liberal in his political opinions, and in both he was probably conventional rather than sincere. Of the value of his writings as a chronicle of current events much has been made, but there is a tendency to ascribe to him elegance alone, to the neglect of his substantial

WALPOLE

literary merits. The complete works appeared in an edition of 1798. Consult further: Cunningham's edition of the 'Letters' (1857-9); Warburton's of the 'Memoirs' (1851); Robins, 'Catalogue of the Classic Contents of Strawberry Hill' (1842); Macaulay's essay in the 'Edinburgh' for October 1833; Cobbett, 'Memorials of Twickenham' (1872); Seeley, 'Horace Walpole and His World' (1884); and the 'Life' by Austin Dobson (1890; 2d ed. 1893).

Walpole, Sir Robert, EARL OF ORFORD, English statesman: b. Houghton, Norfolk, 26 Aug. 1676; d. there 18 March 1745. He was educated at Eton and King's College, Cambridge, and became a good classical scholar. On the death of his elder brother in 1698 he resigned his scholarship, in 1700 entered Parliament as member for Castle Rising, and in 1702 was elected for King's Lynn. He became a leader of the Whig party, and soon distinguished himself by attention to business, and, though not an orator, by practical debating power. In 1708 he was appointed secretary-at-war, and intrusted with the management of the House of Commons. He was one of the managers of the impeachment of Sacheverell (q.v.) (1710), though privately opposed to that measure. Soon after this the Whigs were dismissed from office. On the meeting of Parliament in 1712 he was convicted of a high breach of trust and notorious corruption, the charge being due wholly to party hostility. He was expelled from the House of Commons, and imprisoned in the Tower. By his party Walpole was regarded as a martyr. He refused to make any submission, and wrote a pamphlet in his own defence. He remained in prison, or held his levee in the Tower, till the prorogation. He was returned again for King's Lynn, after the dissolution in 1713, and resumed his place and influence in the House. In the first ministry of George I. (1714) he was appointed paymaster of the forces. He was also in 1715 made chairman of the committee to impeach the late ministers, Bolingbroke, Ormonde, Oxford, and Stafford. In October he was made first lord of the treasury and chancellor of the exchequer. In April 1717, a split having occurred in the ministry, Walpole resigned, and made himself formidable in opposition. He opposed the quadruple alliance and the South Sea Scheme, in which, however, he did not disdain to speculate and make a fortune. In 1720 he again took office as paymaster of the forces, and was intrusted with the measures rendered necessary by the failure of the scheme. (See SOUTH SEA BUBBLE). On the resignation of Sunderland he again became chancellor of the exchequer and first lord of the treasury, 3 April 1721, and for 21 years held the highest office in the state without interruption. During his long administration the Hanoverian succession, to which he was zealously attached, became firmly established, a result to which his prudence and political sagacity largely contributed. He promoted by an enlightened policy the commercial prosperity of the nation, and relieved the weight of taxation by many improvements in the tariff. He was the first English minister after the Restoration to make particular study of commerce and finance, and it was he who laid the basis for the free-trade

and colonial policies of Great Britain. To the war with Spain he was decidedly averse. In February 1742, two days before his resignation, he was created Earl of Orford. So long a period of office did not of course pass without opposition. In 1733 his important excise bill failed to pass, and during the later years of his ministry he encountered increasing difficulties. When, after successive defeats in Parliament, he resigned, he was consulted by the king as to his successors, and allowed to stipulate for his own immunity. An attack was soon, however, made upon him in Parliament, and a committee of secrecy appointed to inquire into his administration. The committee's report charged him with having used undue influence at elections, with granting fraudulent contracts, and with peculation and profusion in the use of the secret service money. The king exerted himself to frustrate the inquiry, and on the other hand the committee did not gain credit for impartiality. The prosecution against Walpole was dropped for want of evidence. He took little further part in public affairs, but was frequently consulted by the king. Walpole has been characterized by Burke as an "intelligent, prudent, and safe minister." He was ambitious for power, but had above his contemporaries an understanding of true national interests. Consult: Various standard histories of England; Coxe, 'Memoirs of Sir Robert Walpole' (1798); the studies by Ewald (1877) and John Morley (1890); 'Historical Sketches of the Reign of George II.' in 'Blackwood's' for April 1868; 'Original Papers' (ed. Macpherson 1775); King, 'Political and Literary Anecdotes' (1818); Macpherson, 'Annals of Commerce,' vol. iii. (1805); Courtney, 'Parliamentary Representatives of Cornwall' (1889).

Walpole, Sir Spencer, English historian, son of Spencer Horatio Walpole (q.v.): b. England, 6 Feb. 1839. He was educated at Eton and entered the employ of the government as clerk in the war office in 1858. He became inspector of the fisheries in 1867, lieutenant-governor of the Isle of Man in 1882 and in 1893-9 was secretary to the post-office. He was knighted in 1898. He has written 'A History of England from 1815' (1878-86); 'The Electorate and the Legislature' (1881); 'Life of Sir John Russell' (1889); 'The Land of Home Rule' (1893); etc.

Walpole, Spencer Horatio, English statesman: b. 11 Sept. 1806; d. London, 22 May 1898. He was educated at Trinity College, Cambridge, was called to the bar in 1831 and in 1846 became queen's counsel. He was home secretary in 1852 and in 1856-82 sat in Parliament for Cambridge University. He was again home secretary for a few months in 1858, and was an unofficial member of the cabinet in 1867-8. From 1887 until his death he was high steward of Cambridge University.

Walpole, Mass., town in Norfolk County; on the New York, New Haven & Hartford Railroad; about 20 miles southwest of Boston. It contains the villages of South Walpole, Walpole, and East Walpole. It was settled in the 17th century, but was laid out as a town about 1720, and in 1724 was incorporated. The chief manufacturing establishments are a furniture factory, paper mill, and cotton factory. There

are eight churches, a high school, and 15 district schools. Pop. (1890) 2,604; (1900) 3,572.

Walpole, N. H., town in Cheshire County; on the Connecticut River, and on the Fitchburg Railroad; about four miles below Bellows Falls and 19 miles northwest of Keene. It is in an agricultural region, on a high bank which has an almost precipitous descent of several feet. The place was founded in 1745 on a site granted by Massachusetts in 1735, and in 1752 confirmed or re-granted, by New Hampshire. There are six churches, a high school, several graded and district schools, and a public library which contains about 6,000 volumes. The bank has deposits amounting to nearly \$300,000. Pop. (1890) 2,163; (1900) 2,693.

Walpurga, wäl-poor'gä, **Walburga**, or **Walpurgis**, Saint, German abbess: b. England; d. 778. She was sister of Saint Willibald, first bishop of Eichstadt, in Germany, and niece of Saint Boniface, the apostle of the Germans. She went, like her uncle and brother, to Germany as a missionary, and became, about the middle of the 8th century, abbess of a convent at Heidenheim, in Franconia. She must have been a learned woman, as she was considered the author of a Latin description of the 'Travels of Saint Willibald.' After her death she received the honors of a saint, was believed to work many miracles, and chapels in honor of her were built in many places. From the circumstance that in German almanacs the name Walpurgis has been accidentally placed, sometimes alone, sometimes together with the names of the apostles Philip and James, against the first of May, the night previous to the first day of May, so famous in German legends for the assembling of the witches, has been called Walpurgis Night. The first of May is an important day for the German cultivator; many contracts are made at this time; the labors of the field assume new activity, etc. It is not strange that, on so important a day, the devil and the witches were supposed to be more active than usual, and to assemble in a particular place to organize the work of evil. This superstition, however, may have had its origin in the ancient German mythology. Hence straw was burned in many places on the Walpurgis night, with a view of dispersing the malignant beings—a custom still preserved in some places. The chief convocation of the witches was considered to take place on the Brocken. Many customs connected with the first of May in Germany originated in this superstition.

Walrus, or **Morse**, an arctic marine pin-niped mammal of the genus *Odobanus*, of which two species are recognized—the Atlantic (*O. rosmarus*), and the Pacific (*O. pacificus*). The walrus is allied to the hair seals (see SEALS), from which it is distinguished by having the upper canine teeth largely developed, and growing from persistent pulps to form tusks. These may attain a length of 15 inches or more, and grow downwards, and slightly inwards. They serve the animal as weapons, as tools in digging up from the sand of the bottom of the sea the mollusks upon which it mainly subsists, and in climbing out upon ice-cakes or rocks of the shore. They are much larger in the males than in the females. The walrus is ordinarily 10 to 12 feet long, with a girth of nearly as much, but is said sometimes to attain a length of 20

feet. The muzzle is abruptly truncated, with long and remarkably strong bristly moustaches; small eyes; external ear wanting, though the orifice is distinctly visible; hind limbs short, connected by a membrane which covers the tail; fore limbs strong and stumpy, all with five digits. The hide is of a tawny brown color, with difficulty penetrated by bullets, and has been likened to a tough, flexible coat of mail.

Walruses are gregarious, and are found on the seashore and on ice floes. They are said to be monogamous, and the female brings forth at nine months one calf, usually on the ice floes. In disposition they are quiet and inoffensive unless attacked, or during the mating season, or when their young are in danger; when they become desperately aggressive, and furiously attack the hunters on the ice or in boats. The walrus is now confined to the regions within the Arctic Circle, though its extinct ancestors had a much wider geographical range, occurring numerous in ancient times as far south as Denmark and Nova Scotia in the Atlantic, and about the Aleutian islands on the northwest coast. Owing to reckless slaughter by sealers and whalers, they are greatly decreased even in the Arctic seas, and the few remaining seek unfrequented spots in high latitudes inaccessible to sealers. The tusks alone have now any commercial value, but formerly walrus hides were used for various purposes, such as machine bands, etc.

Consult Allen, 'North American Pinnipeds' (Washington 1880); and standard authorities.

Walsall, wäl'säl, England, a manufacturing town of Staffordshire, eight miles north-northwest of Birmingham. The environs present much fine scenery, and the town is handsomely built. The chief buildings and establishments are a modern parish church, with tower terminating in a lofty spire, and other places of worship; a free grammar, blue-coat charity, and other schools; a town-hall and jail; a public library and news-room; county court, a handsome structure with a Doric colonnade; a technical school; and four public parks. The situation of the town gives it great advantages for carrying on the iron manufacture, which forms a leading industry; the chief articles consisting of ironmongery, including coach and carriage harness mountings, buckles, chains, locks, keys, screws, files, edge-tools, gas-tubes, etc. Saddlery and harness are extensively made, and are the staple of the town. There are also brass and iron foundries, machine-shops, tanneries, and establishments for currying, dyeing, and japanning hides, malt-works, and clothing-factories; and in the vicinity extensive lime-works, and both coal and iron pits. Walsall is of considerable antiquity, but the existing town is almost entirely of modern origin. Pop. (1901) 86,440.

Walsh, wölsh, **Robert**, American lawyer: b. Baltimore, Md., 1784; d. Paris, France, 7 Feb. 1850. He was educated at the Roman Catholic College, Baltimore, and at the Jesuit College, Georgetown, D. C., traveled in Europe until 1809, and on his return studied law, was admitted to the bar, and established a law practice at Philadelphia. Later he entered journalism, and in 1811-13 published the 'American Review of History and Politics,' the first quarterly issued in the United States. He edited the 'American Register' in 1817-18, and

WALSINGHAM — WALTER

in 1819 established the Philadelphia 'National Gazette,' which he conducted until 1836. He revived the 'American Review' in 1827 and edited it until 1837. He removed to Paris in 1836, was United States consul there in 1845-51, and continued his residence in that city until his death. He wrote: 'Letter on the Genius and Disposition of the French Republic' (1810); 'Appeal from the Judgment of Great Britain Respecting the United States' (1819); 'Didactics: Social, Literary, and Political' (1836); etc.

Walsingham, wôl'sing-am, **SIR FRANCIS**, English statesman: b. Chislehurst, Kent, in or about 1530; d. London 6 April 1590. He studied at King's College, Cambridge, and traveled on the Continent until early in the reign of Queen Elizabeth. He was introduced to public service by Cecil. His first embassy is said to have been to France about 1561. He resided in France as ambassador from August 1570 to April 1573, and on his return was made principal secretary of state and a privy-councillor, and soon after knighted. In 1578 he was ambassador to the Netherlands, in 1581 to France, and in 1583 to Scotland. After having the chief direction of the measures for the discovery of Babington's conspiracy, he was appointed one of the commissioners for the trial of Queen Mary in 1586. He was afterwards made chancellor of the duchy of Lancaster. He retired from public life some time before his death. It is somewhat remarkable that so little is known of Walsingham's career; but he worked in secrecy and dealt mainly in intrigue. He is said to have had 53 private agents and 18 spies at foreign courts, and many stories are told of his diplomatic profundity. In his private character Walsingham is said to have been ascetically strict in his morals and puritanic in his religious zeal. An account of Walsingham's embassy to France appeared in a work by Sir Dudley Digges, entitled 'The Complete Ambassador,' published in 1655; and a work entitled 'Arcana Aulica' has been wrongly ascribed to Walsingham himself.

Walter, wâl'ter, **JOHN**, English publisher: b. 1739; d. Teddington, Middlesex, 16 Nov. 1812. He was first engaged as a coal merchant, in which business he accumulated a considerable fortune, but lost it in subsequent operations as an underwriter. In 1782 his attention was attracted to an invention of one Henry Johnson, who had patented in 1778 and 1780 a printing device known as logotypes, or fonts containing entire words or syllables instead of letters. In 1784, having purchased the Johnson patents, he opened a printing office in London known as the Logographic Office, and engaged in publishing books. On 1 Jan. 1785 he issued the first number of a small newspaper, 'The Daily Universal Register,' "printed logographically," which was really the first number of the 'Times,' though that name was not assumed until 1 Jan. 1788, when 'The Times, or Daily Universal Register' appeared, the alternative title being dropped in the succeeding March. The 'Times' was not immediately a success, and the logographic process had eventually to be abandoned, but Walter seems to have derived some profit from his book printing, and gradually the 'Times' became a power in the land. In 1786, however,

Walter was convicted of having printed a "libel," the offense having been the statement that the Dukes of York, Clarence, and Cumberland were insincere in their congratulations on the king's recovery. He was sentenced to a year's imprisonment in Newgate, to stand in the pillory for one hour, pay a fine of £50, and to enter into recognizances for his good behavior for seven years. He was subsequently sentenced to a second year's imprisonment before the expiration of the first and further fines of £200 on other libelous charges, but was pardoned after 16 months at Newgate. Broken in health and spirit at his continued misfortunes Walter retired from the management of the business in 1795.

Walter, **JOHN**, English editor and publisher, son of the preceding: b. London 23 Feb. 1776; d. there 28 July 1847. He was studying for the ministry at Oxford, when in 1797 or 1798 his father summoned him to London to assist in the management of the 'Times.' From the date of his assumption of the management a new spirit was manifested in the paper, and in 1803 he became sole manager. He maintained an independent course, which, while it made the reputation of the 'Times,' cost its editor the little official patronage it had enjoyed. For 18 years the firm had been printers for the board of customs, but in 1805, in consequence of criticism of Lord Melville's administration of the admiralty department, he was deprived of the employment. His enterprise had increased the circulation of the 'Times' from 1,000 to 5,000 copies in 10 years, notwithstanding the continued opposition of the government. In 1805 he made arrangements for obtaining foreign news and in 1807 sent Henry Crabb Robinson (q.v.) to Germany, the first of the afterward numerous class of special correspondents; and though every measure possible was used by the government to delay his foreign despatches, Walter frequently published foreign information days before the same intelligence was officially received by the government. He afterward frankly admitted that smuggling was the only means by which he could obtain French journals. Ultimately the 'Times' took its place as the leading English journal, and Walter may be considered as its real creator. On 29 Nov. 1814 he issued his paper printed by König's steam machines, the first paper to be printed by that method. He acted as editor of the paper until after 1810, but from that time entrusted a share of the editorial work to Sir John Stoddart. In 1832-7 he sat in Parliament for Berkshire, but resigned in the latter year because of differences with his constituents; was returned for Nottingham in 1841, but was unseated in the following year. His later years were spent chiefly in retirement.

Walter, **THOMAS USTICK**, American architect: b. Philadelphia, Pa., 4 Sept. 1804; d. there 30 Oct. 1887. His early training was received in the office of William Strickland, and in 1830 he launched out for himself, building the Moyamensing Penitentiary in 1831. In 1847 he completed Girard College from his own designs, a building which has always been admired for the classic purity of its proportions. This classical *motif* he carried out also in his extension of the national Capitol at Washington, D. C., to which he added its noble dome.

WALTERBORO—WALTHAM

He erected many public buildings at Washington, including the Post-office, and the Government Hospital for the Insane. He was one of the original members of the American Institute of Architects, professor of architecture in Franklin Institute, and lecturer on architecture in Columbia College.

Walterboro, S. C., town, county-seat of Colleton County; on the Charleston & Savannah Railroad (Plant System), about 29 miles west of Charleston. It is in an agricultural region, in which cotton is one of the chief products. It has cotton mills, lumber mills, naval stores, lumber yards, and large store houses. The two banks have a capital of \$35,000. Pop. (1890) 1,171; (1900) 1,491.

Walters, wāl'térz, **William Thompson**, American merchant and art collector: b. on the Juniata River, Pa., 23 May 1820; d. Baltimore, Md., 22 Nov. 1894. He was educated to be a civil engineer, but became interested in the coal and iron industry, and while in charge of a smelting establishment in Pennsylvania produced the first iron manufactured from mineral coal in the United States. He removed to Baltimore in 1841, and established himself as a wine merchant there in 1847. He was president of the first steamship line between Baltimore and Savannah and was one of the reorganizers of the Southern lines. In 1861-5 he resided in Europe, where he traveled widely in the interest of art, and purchased numerous additions for his collection. He was United States commissioner at the Paris expositions of 1867 and 1878, and also to that at Vienna in 1873. He was a trustee of the Corcoran Art Gallery at Washington, D. C., and of the Peabody Institute. His private collection was one of the largest and most valuable in the United States, and his annual exhibit of his gallery for charity netted \$30,000 for the poor of Baltimore. He wrote: 'Barye' (1885); 'Notes Upon Certain Masters of the 19th Century' (1886); etc.

Walthall, wól'thal, **Edward Cary**, American soldier: b. Richmond, Va., 4 April 1831; d. Washington, D. C., 21 April 1898. Admitted to the bar in 1852, he began practice in Coffeeville, Miss., and was district attorney for the 10th judicial district of Mississippi 1856-61. He then entered the Confederate army as lieutenant, becoming brigadier-general in December 1862 and major-general in June 1864. He especially distinguished himself at the battle of Missionary Ridge, where he led his brigade over a ridge and held back the Federal troops till the Confederate army made its escape; and he covered the retreat of General Hood's army after the defeat at Nashville. He practised law in Grenada, Miss., 1871-85, when he was appointed a United States Senator to fill out the unexpired term of Lucius Q. C. Lamar. He was elected for full terms in 1888 and in 1892, was chairman of the committee on military affairs, and served on the committees on the improvement of the Mississippi River and on public lands.

Waltham, wól'tham, Mass., city in Middlesex County; on the Charles River, and on the Boston & Maine Railroad; 10 miles west of Boston. It is connected by electric railway with Boston, Newton, and many of the places in the vicinity.

Industries.—The chief manufacturing establishments are the two watch-making works. At the American Waltham Watch Works, the first successful attempt was made to manufacture watch movements, on a large scale, by machinery. It is now the largest watch factory of its kind in the world. In 1814 a cotton mill was erected here, the first in the United States in which, under the same roof, the raw material was put through all necessary forms, even through the bleachery and the dye works, and came out the finished cotton cloth of the market. Other manufacturing are saddlery and harness works, foundry and machine shops, wagon and carriage factories, emery wheel works, lumber mills, furniture factories, and men's clothing factories. In 1900 (government census) Waltham had 275 industrial establishments—employing 5,392 persons, to whom was paid annually \$2,630,929. The cost of the materials used each year was \$2,317,792, and the plants were capitalized for \$9,152,169. The value of the annual products was \$6,934,381.

Public Buildings and Municipal Improvements.—The principal public buildings are the government building, the municipal buildings, banks, churches, and schools. There is one large park and a number of small squares. The waterworks are owned and operated by the city. The main business streets and many of those in the residential sections are paved. The roads leading to the near-by villages and towns are well made and kept in good repair. The pure water, favorable climate, and good sewerage make the place most healthful.

Churches and Schools.—There are 15 churches representing 10 different denominations. The educational institutions are the Massachusetts School for the Feeble-Minded, the Waltham Nurses' Training School, the Notre Dame Normal Training School, a public high school and two private schools doing high school work: Saint Mary's School (R. C.) and Waltham New Church School (New Jerusalem Church). There are several commercial schools and Mellor's Commercial College, public and parish graded elementary schools, public evening schools, several private schools, a public library which contains about 30,000 volumes, and several school libraries.

Banks.—There are two banks, one national and one state bank. The national bank has a capital of \$150,000; and the two banks have deposits amounting to \$4,183,990, the state bank alone has deposits of \$3,459,990. The surplus and profits are \$296,970.

Government.—The government is administered under a charter of 1893 which provides for a mayor elected annually and a common council. The mayor appoints, subject to approval of the council, the majority of the administration officials, but the board of education is chosen by popular vote.

History.—Waltham was settled by farmers in the early days of the colony. The first incorporation was that of Watertown, which then embraced the territory now included in Waltham. In 1738 Waltham was set off from Watertown and incorporated as a town; and in 1884 it was granted a city charter.

Pop. (1890) 18,707; (1900) 23,481.

Consult Hurd, 'History of Middlesex County.'

WALTHAM ABBEY — WALTON

Waltham Abbey, or Waltham-Holy-Cross, England, a market town of Essex, 12 miles north by east of London, on the left bank of the Lea. It consists chiefly of one irregular main street; and has a spacious Norman church, which once formed the nave of the famous abbey church of the Holy Cross, where King Harold is buried. There are here government manufactures of gunpowder and percussion-caps, cordite, and small-arms, besides breweries, flour-mills, etc. The old abbey of Waltham was founded or enlarged by King Harold in 1060, and is said to have once possessed a fragment of the cross on which Christ suffered. In the neighborhood are the village of Waltham Cross, and an "Eleanor cross," recently restored. Pop. (1901) 6,547.

Walther von der Vogelweide, vält'ër fôn dër fô'gël-vî-dê, German lyric poet of the class of *Minnesingers*: b. about 1160; d. about 1227. He was descended from a noble but not wealthy family, whose castle, Vogelweide, is supposed to have been situated in Tyrol. Walther resided at the court of Frederick, the eldest son of Leopold VI., duke of Austria, and on Frederick's death in 1198 left the court of Vienna and entered on a series of wanderings. He remained longest at the splendid court of the Landgrave of Thuringia, who had always around him a circle of poets, and instituted that celebrated poetic contest, the war of the Wartburg (1207), in which Walther took part. Walther shows himself, in his political poems, a warm partisan of the imperial interests against the Papacy. The Emperor Frederick II. was also a patron, and bestowed on him a small fief. His poems, all of which are lyric, have been published by Lachmann (1827). Consult: Milmanns, 'Leben und Dichten Walthers von der Vogelweide' (1882); Schönbach, 'Walther von der Vogelweide, ein Dichterleben' (1895).

Waltner, vält-nâr, Charles, French copperplate engraver and etcher: b. Paris 24 March 1840. He studied painting under Gerome and took up engraving with Martinet and Henriquet-Dupont. In 1868 he carried off the Prix de Rome. As an etcher and engraver he has been very successful in reproducing paintings in black and white. His chief works are 'Portrait of the Baron von Biczq,' after Rubens (1870); 'The Infanta Marguerete,' after Velazquez; 'Rembrandt,' after the portrait by that master himself; 'The Entombment,' after Vandyck; the 'Angelus,' after Millet; 'Christ Before Pilate,' after Munkacsy (1882); 'The Watch,' after Rembrandt (1885); and 'Portrait of a Rabbi,' after Rembrandt.

Walton, wâl'tôn, Brian, English Biblical scholar: b. Yorkshire 1600; d. London 29 Nov. 1661. He was graduated at Cambridge and from a curacy advanced through many preferments to a prebend in Saint Paul's. At the Restoration he was made chaplain to Charles II. and bishop of Chester. His greatest work is 'Biblia Sacra Polyglotta' (6 vols. folio 1,657). This work comprises the Hebrew original of the Old Testament, the Samaritan Pentateuch, the Chaldee, Syriac, Arabic, Persian versions, and the Latin Vulgate with various readings, notes, etc., still thought to be "the most complete Biblical apparatus in any language." He wrote in 1658 his 'Dissertation on the Antiquity and Authority of His Texts,' in later editions called the

'Prolegomena,' under which name it was published in the original Latin (1827-8). 'The Considerator Considered,' etc. (1659), was written in answer to Dr. John Owen's 'Vindication of the Purity and Integrity of the Hebrew and Greek Texts,' etc., a criticism on Walton's great Biblical work.

Walton, George, American patriot: b. Frederick County, Va., 1740; d. Augusta, Ga., 2 Feb. 1804. He was apprenticed to a carpenter, but studied law at night by the light of pine-knots, in 1774 was admitted to the bar, and began practice in Augusta. Together with three others he called a meeting at Savannah 27 July 1774 for the purpose of discussing measures of resistance against the arbitrary proceedings of Great Britain and was one of a committee inviting co-operation from the sister colonies. Later he was one of the committee which prepared a petition to the king and in 1776 was sent as a delegate to the Continental Congress. He was one of the signers of the Declaration of Independence, and continued a delegate to Congress until 1781. He was appointed colonel of militia in 1778 and commanded a battalion under Howe when Savannah was captured by the British in September 1778, was seriously wounded, taken prisoner, and held until September 1779. He was chosen governor of Georgia in the following month, was chief justice of the State in 1783, 1787, and 1793; re-elected governor of Georgia in 1789, and in 1795-6 was United States senator.

Walton, Izaak, English author: b. Stafford 9 Aug. 1593; d. Winchester 15 Dec. 1683. After receiving a school education in his native town he went to London and was apprenticed to an ironmonger. In 1618 he was made free of the Ironmongers' Company and seems to have retired with a competency in 1644. The statement frequently made that he was a sempster or haberdasher is unsupported by recent research. He early became closely acquainted with Dr. John Donne, Sir Henry Wotton, and other famous men; and was a strong royalist and the friend of prominent royalists. Doubtless, after Marston Moor, he devoted himself much to fishing. Walton's fame rests on 'The Compleat Angler, or the Contemplative Man's Recreation: Being a Discourse of Fish and Fishing, Not Unworthy the Perusal of Most Anglers.' It was published in 1653, and went through five editions in his lifetime. The 5th edition, issued in 1676, contained, as a second part, Charles Cotton's treatise on fly-fishing, written to correspond with Walton's, and designated 'Instructions how to Angle for Trout or Grayling in a Clear Stream.' The chief subsequent editions are those by Moses Browne (1750), Sir John Hawkins (1760), Major (1824), Sir Nicholas Harris Nicolas (1836), Jesse and Bohn (1856), Marston (1888), Harting (1893), Lang (1896). There is a facsimile reprint of the first edition by Elliot Stock (1876), republished in 1877, 1880, and 1896. Lowell wrote the introduction for an American edition of 1880. Walton also wrote almost equally famous biographies of John Donne (1630), Sir Henry Wotton (1651, in 'Reliquie Wottonianæ'), Richard Hooker (1665), George Herbert (1670), and Robert Sanderson (1678). The first four were published together in 1670, and have been often reissued, as for instance, under the editorship

WALTON — WAMPUM

of A. H. Bullen (1884) and Austin Dobson (1898). Besides the short pieces of poetry in his works, Walton wrote other occasional and prefatory verses, which are to be found in R. H. Shepherd's 'Waltoniana' (1878). The charm of 'The Compleat Angler' is due to its purity and simplicity of style, the ease and unaffected humor of the dialogue, and its exquisite pictures of natural scenery, combined with the picture that it presents us of the writer's own sunny and benevolent nature.

One Richard Franck, a Commonwealth soldier, displayed his contempt of a royalist angler's practical acquirements in his 'Northern Memoir' (1694). Consult further the lives by Zouch (prefixed to the 'Lives' in 1796; separately printed 1823); Nicolas (prefixed to the edition of the 'Compleat Angler' 1836), the basis of later works; Marston (1888); also Tweddell, 'Izaak Walton and the Earlier English Writers of Angling' (1854), and Blakey, 'Literature of Angling' (1856).

Walton, N. Y., village in Delaware County; on the New York, Ontario & Western Railroad; about 175 miles northwest of New York, and 18 miles southwest of Delhi. It is in an agricultural and dairy region, and the industries are connected with farm and dairy products. It has a foundry, machine shops, novelty works, and furniture factory. There are eight churches, a high school, graded elementary schools, and a school library. There is one national bank capitalized for \$50,000, with deposits amounting to \$450,000. Pop. (1890) 2,299; (1900) 2,811.

Waltz, a dance executed by any number of couples, the gentleman having his arm around his partner's waist, the couple wheeling round on an axis of their own, and at the same time moving round the room. The music is written in triple time in crotchets or quavers. Compositions in waltz form are often not intended for dance tunes. See DANCING.

Walworth, wāl'wérth, **Ellen Hardin**, American writer: b. Jacksonville, Ill., 20 Oct. 1832. She was married to M. T. Walworth (d. 1873) in 1852. She was one of the three founders of the National Society of the Daughters of the American Revolution in 1890: was director-general of the Women's National War Relief Association in 1898; and one of the first three women elected to the school board under the New York law. She has been prominent in various club movements, and has lectured and written extensively. Her writings include: 'Battles of Saratoga' (1891); 'Parliamentary Rules' (1897); etc.

Walworth, **Jeanette Ritchie Hadermann**, American novelist: b. Philadelphia, Pa., 22 Feb. 1837. She was carefully educated and at 16 became a governess, but was shortly afterward married to Douglas Walworth, of Natchez, Miss. She has lived in different parts of the South, but has made her permanent home in New York. Her publications include: 'Forgiven at Last' (1870); 'Dead Men's Shoes' (1872); 'The Bar Sinister' (1885); 'Splendid Egotist' (1889); 'The Silent Witness'; 'An Old Foggy'; 'New Man at Rossmere' (1903).

Walworth, **Reuben Hyde**, American jurist: b. Bozrah, Conn., 26 Oct. 1789; d. Saratoga, N. Y., 21 Nov. 1867. He was mainly self-taught,

was admitted to the bar in 1809 and settled at Plattsburg, N. Y. He became master in chancery in 1811 and soon rose to eminence in his profession. He sat in Congress 1821-3, removing to Saratoga in the last-named year, was a circuit judge 1823-8 and chancellor of New York 1828-48. His decisions as circuit judge are included in 'Cowan's Reports' (9 vols. 1824-30); as chancellor, in 'Paige and Barbour's Reports' 14 vols. (1830-49). He published 'Rules and Orders of the Court of Chancery' (1829); 'Genealogy of the Hyde Family' (1864).

Wampanoag ("Eastern land"), a tribe of the Algonquian stock of North American Indians, closely related to the Massachusetts tribe, whose language they spoke. They were sometimes called Pokanokets, from their principal village, and Massasoits, from a prominent chief. The Wampanoags resided on Narragansett Bay, in Bristol County, R. I., and Bristol County, Mass., but originally they claimed the territory between Narragansett Bay and Pawtucket River and the Atlantic, including the islands of Nantucket and Martha's Vineyard. The Cape Cod branch of the tribe were visited by Gosnold in 1602, and by other whites at an early date. In 1617 many of their number perished from disease, prior to which time they claimed to have had 5,000 warriors, or about 18,000 souls. When the Plymouth Colony was planted in 1620 the Wampanoags inhabited 30 villages; Massasoit was their chief, and the treaty which he made with the colonists was faithfully observed by him until his death. He was succeeded by his son, popularly known as "King Philip," who, chafing under the ill-treatment which his people had suffered at the hands of the whites, aroused the resentment of all the Algonquian tribes from the Merrimac to the Thames (except the Wampanoags of Cape Cod and Martha's Vineyard), and in 1675 began a war against the whites which continued for two years and proved to be the most disastrous Indian conflict in New England history. The Indians were ultimately overcome, but not until Philip and other leading chiefs had been killed, and the Wampanoags and Narragansetts almost exterminated. Those who could, fled to the interior tribes, many captives were sold as slaves, and others joined the various "praying Indians" of southern Massachusetts.

Wam'pum, or **Shell Money**, a general name given to certain shells or shell-beads used as a medium of exchange among the Indians of the Atlantic Seaboard States. Not merely did it serve the Indian as a medium of exchange and a standard of values, but worn as an ornament it was his badge of wealth and position, in the hands of the chiefs his record book and ledger, and through the favor of the Great Spirit its possession became in no small degree the passport to the happy hunting grounds of the future world. The use of wampum constituted a bond of union among the Indians such as was scarcely supplied by language, religion or racial customs. Wampum was made from shells, usually clam or oyster, and it was therefore not surprising that the coast dwellers were the most prolific producers of it. The black beads were made from the dark "eye" of the shell, the scar indicating the point of muscular attachment, while the white ones were taken

WANAMAKER — WANTAGE

from the outer parts. Black beads were known as sacki, white ones as wompi, and the black were usually considered twice as valuable as the white. The beads themselves were simply little shell cylinders about one eighth of an inch in diameter and one fourth of an inch in length. They were polished smooth by being rubbed against stones, and were bored by means of a flint awl, many of which are still to be found in the shell heaps along the New England coast. The English colonists were compelled to use wampum as a medium of exchange with the Indians for over half a century. Rhode Island recognized it officially as late as 1670. In New York it was used until after the end of the century — as for instance in the payment of the ferryage between New York and Brooklyn. It was used in Southern Connecticut as late as 1704, and in the backwoods regions of the northern and middle colonies well down into the 18th century.

Wanamaker, wŏn'a-mā-kēr, John, American merchant: b. Philadelphia 11 July 1838. He received a common school education, and began his business career at 14 as errand boy in a store. In 1861 he established, with his brother-in-law, a clothing store under the firm name of Wanamaker & Brown, which in 1869 became the firm of John Wanamaker & Co. From this beginning he built up a department store which is the largest in the city, and in 1896 established a similar store in New York in the building formerly occupied by A. T. Stewart's firm. In 1903 he began the construction of a larger building in New York, which is to be a station of the subway. He has been active in the public life of Philadelphia, taking a prominent part in the movement to secure pure water for the city, in 1886-87, and in other reform movements, and has taken part in State and national politics as an "anti-machine" Republican. In 1888 he was a presidential elector, and in 1889 entered President Harrison's cabinet as postmaster-general. During his term of office he established the sea post-offices, and strongly favored a postal telegraph system. He has taken an active part in religious work, was for several years president of the Philadelphia Young Men's Christian Association, and in 1858 organized a small Sunday-school which became the Bethany (Presbyterian) Sunday-school, one of the largest in the United States.

Wan'apum Indians ("river people"), a tribe of the Shahaptian stock of North American Indians — the Sokulks of Lewis and Clark. They range along both banks of the Columbia in Washington, from above Crab Creek down to the mouth of Snake River. Having never made a treaty or gone on a reservation, they are not yet officially recognized by the government. Pop. about 200.

Wandering Cells, or **Phagocytes**. See PHAGOCYTOSIS.

Wandering Jew. See JEW, THE WANDERING.

Wandering Jew, a name applied to various plants — in Great Britain to the beefsteak or strawberry geranium (*Saxifraga sarmentosa*) and to the Kenilworth ivy (*Linaria cymbalaria*). *Zebrina pendula*, a leafy rapidly growing plant, with lance-ovate leaves, glossy and bright green or purplish above with broad silvery

stripes, is also known as the wandering jew; it will grow either in sun or shade, or in water alone. Another wandering jew is a spider-wort (q.v.).

Wan'derley, João Mauricio, BARON COTEGIPE, Brazilian statesman: b. Barro do São Francisco, Pernambuco, Brazil, 23 Oct. 1813; d. Rio de Janeiro, Brazil, 13 Feb. 1889. He studied law and soon entered politics, joining the Conservative party, and from 1842 was repeatedly elected deputy. In 1856 he became senator, holding the office until his death and acting as president of the body in 1882 and 1885. He was created a baron in 1868, was minister to the Platine republics in 1870, and concluded the treaty of peace with Paraguay. He was a cabinet officer in nearly all the Conservative cabinets and in 1885 organized the ministry which secured the general emancipation law.

Wanderoo', or **Wanderu**, a large monkey (*Macacus silenus*) of southern India, especially the country bordering the Malabar coast. The wanderoos have long, slim bodies, covered with black hair, and tufted tails. The head looks very large, because of a mane, or ruff, and beard, which sticks out around the face, and is either gray or white, enhancing the sly look of the broad face, dull eyes, and broad muzzle.

The name is also given generally to monkeys of the genus *Semnopithecus*. *S. ursinus* is the great wanderoo of Ceylon, and Eastern zoologists think the term should be restricted to this species alone.

Wandsworth, wānz'd'wérth, London, England, a metropolitan and parliamentary borough on the south side of the Thames; area 9,130 acres. Wandsworth proper is situated close to the Thames, near the mouth of its small tributary, the Wandle, and is built between and on the slopes of two hills. New Wandsworth, a suburb of recent growth, lies to the east and south of both stretches of Wandsworth Common, beside which are the Surrey County prison, the county lunatic asylum, etc. There are many important industrial establishments. Pop. (1901) 232,034.

Wang Shih-fu, wāng'shī'foo, Chinese dramatic poet. He lived in the 13th century, was the creator of the Chinese opera 'Thsa-Khi,' and composed 13 plays, of which only two survive. The 'Hsi Hsiang Chi,' or 'Story of the Western Pavilion' — like all Chinese plays, a sort of novel in dialogue — is his best work and obtained and still holds great popularity with the Chinese. It has been called by Giles "of all plays of the Mongol dynasty, the one which will best repay reading." The other is the comedy, 'The State Minister's Feast.' The former was partly translated into French by Stanislas Julien (q.v.), the eminent French sinologue, in 'Europe Littéraire.'

Wantage, wŏn'tāj, England, a market-town in Berkshire, in the fertile vale of the White Horse, 13 miles southwest of Oxford. There are an interesting old church, a town-hall, corn exchange, grammar school, and cottage hospital. Iron and brass founding, and the manufacture of sacks and similar articles are carried on. King Alfred, to whom there is a statue by Count Gleichen, erected in 1877, was born at Wantage, as was also Bishop Butler. Pop. (1901) 3,766.

WANX RIVER—WAPPINGER

Wanx River. See CAPE RIVER.

Wapakoneta, wä'pa-kön-ët'a, Ohio, village, county-seat of Auglaize County; on the Auglaize River, and on the Cincinnati, Hamilton & Dayton Railroad; about 30 miles north of Piqua and 13 miles south by west of Lima. It is in an agricultural region and in the natural gas and petroleum belt. The place was visited by whites in the early part of the 19th century, and some settlements were made. It was laid out as a village in 1833. Where the village now stands was the site of an Indian village of importance, the meeting place of certain tribes. In 1831 it was the scene of the signing of the treaty whereby the Shawnees and Senecas relinquished their lands to the government. Wapakoneta was the last place in Ohio occupied by the Indians. The chief manufactures are furniture, wheels, machinery, and furnishings for dairies, and a machine shop. There are three banks, two national and one private. The national banks have a combined capital of \$200,000 and deposits amounting to \$1,045,400. Pop. (1890) 3,616; (1900) 3,915.

Wapello, wa-pel'ō, Iowa, town, county-seat of Louisa County; on the Iowa River, and on the Burlington, Cedar Rapids & Northern Railroad; about 31 miles north of Burlington, and 20 miles south of Muscatine. It is in a rich agricultural region in which the principal products are wheat, corn, vegetables, and fruit. Considerable attention is given to stock-raising. The manufacturing establishments are flour and lumber mills, fruit and vegetable canneries, agricultural implement shops, and creameries. The town makes large shipments of grain, canned goods, hay, and live stock. There are two banks, one state and one private. Pop. (1890) 1,009; (1900) 1,398.

Wap'entake, or **Wapentac**, in England, an ancient county among some of the northern shires, still retained in Yorkshire. It corresponds to the "hundred" of the southern counties. The word means "weapon-touching" and refers to the custom of the chiefs of a particular district meeting at a certain day at a specified spot, when the head chief, alighting from his horse, raised his spear in the air, and the inferior chiefs, also on foot, touched this spear with their lances, and so acknowledged their fealty.

Wap'iti, an Indian name of the great North American deer (*Cervus canadensis*) known in the West as "elk," but more like the red deer than the European or true elk (q.v.). It formerly ranged from the mountains of the Carolinas to lat. 56 to 57° N., but now nearly extinct, except in the northern Rocky Mountains. It is closely allied to but considerably larger than the stag, standing about 64 inches at the shoulder; yellowish brown on upper parts; sides gray, long coarse hair in front of neck, like a dewlap; antlers large, often exceeding 4 or even 5 feet in length; brow-tine duplicated. The wapiti resembles the Old World stag or red deer rather than the elk. In the Northwest it is represented by several related species, but the Eastern wapiti seems doomed to extinction as a wild animal. During the winter these noble animals gather in large herds and feed on the open hills. The antlers are shed about March, and the new ones are complete by

September. The bucks fight fiercely and not infrequently with fatal result at the pairing season; and the stronger ones are polygamous, gathering into their herds every available cow and guarding them and the young with jealous care. They eat almost everything of a vegetable nature, leaves and twigs as well as grass and herbs. During the summer, when they are much troubled by mosquitoes and flies, they are fond of entering the water and of wallowing in mud holes. See DEER.

Wappæus, vä-pä'oos, **Johann Eduard**, German geographer: b. Hamburg 17 May 1812; d. Göttingen 16 Dec. 1879. He was educated at the universities of Göttingen and Berlin, and in 1833-4 traveled in Brazil and the Cape Verde Islands. He became a tutor at Göttingen in 1838, was appointed adjunct professor there in 1845, and from 1854 until his death was full professor in that university. His most widely known work is his edition of the Stein-Hörschelmann 'Handbuch der Geographie und Statistik' (1871), of which he wrote the volumes on 'Universal Geography' (1849); 'North America' (1855); 'Central and South America' (1867); and 'Brazil' (1871). His other writings include: 'Untersuchungen über die geographischen Entdeckungen der Portugiesen unter Heinrich dem Seefahrer' (1842); 'Deutsche Auswanderung und Kolonisation' (1846); 'Allgemeine Bevölkerungsstatistik' (1859-61); etc.

Wap'atoo, an aboriginal name of the root of the common arrowhead (*Sagittaria variabilis*) which was a favorite food of the North American Indians.

Wappers, vāp-ār, **Gustav**, BARON, Belgian painter: b. Antwerp 23 Aug. 1803; d. Paris 6 Dec. 1874. Educated at the Art Academy of his native city under Van Bree and Herreyns, he went to Paris and devoted himself to copying the masterpieces of the Venetian School and subsequently studied the style of Rubens, Jordaens and the Flemish painters. He made the first great hit in 1830 by a large picture representing the 'Burgomaster Van der Werf of Leyden in the Spanish Siege.' Wappers surrounded himself with a number of young painters and under the enthusiasm he kindled a new school of Belgian painting came into existence. In 1832 he was appointed professor and eight years later director of the Art Academy of Antwerp; from 1846 to 1853 he was president of the Belgium National Museum and in 1847 was ennobled. Among his principal pictures are 'The People of Brussels Tearing up the Proclamation of Prince Frederick' (1835, in the Museum at Brussels); 'The Entombment' (1836, in Saint Michael's Church, Louvain); 'The Madonna in Clouds Surrounded by Angels'; 'Charles IX. Shooting Down the Huguenots'; 'Anne Boleyn Taking Leave of Elizabeth'; 'Boccaccio Reading His Decameron to Johanna of Aragon'; 'The Capture of Rhodes by the Turks,' etc.

Wappinger ("the east"), a confederacy of the Algonquian stock of North American Indians formerly occupying the territory extending eastward from Hudson River, between the neighborhood of Poughkeepsie and Manhattan Island in New York to the valley of Connecticut River in Connecticut. They were closely related to the Mohicans, and by most authorities

WAPPINGER FALLS — WAR AND PEACE

are regarded as having been a part of them. The component tribes of the Wappinger confederacy were: (1) the Wappinger, which formed the principal tribe and which occupied Dutchess County, N. Y., about Poughkeepsie and Wappinger Kill; (2) the Recgawawancs; (3) Wequaesgeeks; (4) Sintsinks; (5) Kitchawanks; (6) Tankitekes; (7) Nochpeems; (8) Siwanoy; (9) Sequins or Mattabescs. As Connecticut became colonized by the whites, the eastern tribes of the confederacy gradually sold their lands and almost dwindled away, the survivors finally joining the Indians at Scaticook, Conn., and Stockbridge, Mass., while a few went to Canada. The Hudson River tribes became involved in war with the Dutch colonists in 1640, which continued for five years, the Indians losing 1,600 of their number and the Wappingers being the chief sufferers. The survivors retained their tribal customs until 1756, and continued to occupy a tract in Westchester County, when most of them joined the Nanticoques, then living under Iroquois protection at Chenango, near Binghamton, N. Y., and finally became merged with the Delawares. Some of them also joined the Moravian and Stockbridge Indians, while a few still resided in Dutchess County just before the American Revolution.

Wappinger (wōp'in-jér) Falls, N. Y., village, Dutchess County, on Wappinger Creek, about two and one half miles from its mouth at New Hamburg, and seven miles south of Poughkeepsie. It is connected with Poughkeepsie by an electric line, and has the advantage of the steamer traffic on the Hudson. The river port used by the village is New Hamburg. The name of the village is that of a tribe of Indians who once inhabited this section. The creek here falls over a series of high ledges which form picturesque cascades, and also furnish water power for several manufactories. The chief industrial establishments are print-works, established in 1834; overall and sheeting factory, machine shop, grist mill, and creameries. The village has a union school, public and parish elementary schools, and a school library. There is one state bank, having deposits amounting to \$463,100. Pop. (1890) 3,718; (1900) 3,504.

War. The last resort for the settlement of disputes is the appeal to physical force, whereby the weaker is either compelled to yield to the demands of the stronger, put to flight, or, in the last extremity, slain. War is resorted to either for advantage or for vengeance. The one party possesses something which the other has resolved to seize, or has inflicted some real or supposed injury on the other, which he determines to punish by the infliction of a corresponding chastisement. War and law are quite opposed to each other, but while opposed they are also related. The ultimate means of enforcing law is by physical force, but in every society the aim of law is to put down every appeal to force except on the part of the magistrate, and equally to restrict his use of it to the enforcement of the law. Where there is no organized society, every individual family, or group, enforces its own claims, and appeals to force are consequently frequent, but as society extends its organization these partial appeals to force are declared illegal and put down. But the society, however extended, is still partial; out-

side of it exist other societies with independent laws and different interests. Between these, disputes are liable to arise, which, failing mutual accommodation, can only be settled by force. In each society, moreover, the central authority is liable to vicissitudes of strength. When it is active and vigorous, the whole society is kept in equilibrium and repose; when it is weak or idle, private or party interests assert themselves, the laws are disobeyed and the central authority may be defied and overthrown. Thus, three conditions of warfare arise according to the degree of organization of society: the state of private war, when no great central authority has been established, or when it has been wholly destroyed; the state of civil war, when such an authority, having been established, has decayed, and the society arranges itself in different parties for the purpose of maintaining the old, or establishing a new central authority; and the state of international war, when states sufficiently powerful to control their own subjects quarrel among themselves. In each of these states war is conterminous with and opposed to law.

The aim of law is always to control war, and either suppress it or render it subservient to its own enforcement or re-establishment; the aim of war is either to supplement the impotence of law, or accomplish some object forbidden by it. Hence the peculiarity of all laws relating to war. They are fluctuating in their nature, because the power to enforce them is frequently wanting; yet they are necessary, and in the end efficacious, because force can be applied in favor of law as well as against it, and it commonly becomes the interest of society in the long run so to apply it. It follows also from these conditions that as there are three states of warfare, so there are three relative states of law opposed to them: international law is opposed to international war, national law to civil war, and natural law to private war. In each case, law forms the boundary of war and war of law, so that where one is strong the other is weak. International law may thus be defined as consisting of those common principles which still continue to be recognized and observed by belligerents. The persistent disregard of any principle of law by a belligerent would annihilate it as a principle of international law, and as the belligerent has already set the power of its immediate antagonist at defiance, the only considerations which can enforce its observance of an international law are its own respect for its principle, or its fear of the power of neutrals. In like manner national law is opposed to and limits civil war. In as far as either party sets the national law at defiance the law is abrogated and can only be re-established by force; in as far as it is observed it controls the action of both parties. Private war is opposed by natural law because there is no positive law recognized by the parties. Violence is limited only by the power or conscience of the belligerents. See INTERNATIONAL LAW.

War and Peace, a novel by Count Lyof Tolstoi (1865-68). It deals with the stirring conflict between Napoleon and France, and Koutouzoff and Russia, and covers the period from 1805 to 1815. War is here treated not alone as a dramatic spectacle, but as a symbol of great social forces striving for expression.

WAR, CIVIL — WAR TARIFF

War, Civil. See UNITED STATES — CAUSES OF THE CIVIL WAR; MILITARY EVENTS OF THE CIVIL WAR; POLITICAL EVENTS OF THE CIVIL WAR; ETC.

War College. See ARMY WAR COLLEGE.

War Dance, among the American Indians, the name given a dance engaged in by the warriors of a tribe before a warlike expedition; a dance simulating a battle.

War Department, one of the executive divisions of the United States government, located at Washington, D. C. The department is under the supervision of a secretary of war, who is a member of the President's cabinet. The department has entire control of all matters relating to the equipment and discipline of the military forces of the United States, and is charged with the duty of carrying into effect all laws relative to the army and militia enacted by the Congress. The secretary's authority in military matters is second only to the President. The first secretary of war was Henry Knox of Massachusetts, whose term of office began with that of Washington. During the Civil War Edwin M. Stanton (q.v.) was the secretary of war. For a complete list of the successive secretaries of war see the article UNITED STATES — CABINET OFFICERS, ETC. See also ARMY OF THE UNITED STATES.

War-eagle, any eagle connected with war or the idea of war in symbolism or otherwise, as the imperial eagle (*Aquila mogolnik*) adopted as a standard first by a favorite legion and later by Roman troops generally; whence the symbol spread to the national insignia of many European countries. The war-eagle of the North American Indians, whose feathers ornamented their war-bonnets and other accoutrements, was the golden eagle (*A. chrysatus*). See EAGLE.

War God. Most ancient religions had their war gods, and in America, before the Spanish conquest, the Mexican war god was specially worshipped, with human sacrificial rites. Ares and Mars were the war gods of Greece and Rome respectively. The Jews evidently regarded Jehovah as presiding over their battles, and David is represented in 1 Samuel xvii. 45, as telling the Philistine that he comes "in the name of the Lord of hosts, the God of the armies of Israel." The same conception exists in some degree among Christians.

War Indemnity, the sum of money paid by the defeated country in an international war to the victorious government. The largest amount ever demanded in this way was \$1,000,000,000, which France was compelled to pay Germany after the war of 1870-71. In the war of 1866 Prussia took from Austria and her allies a war indemnity of \$41,750,000, besides \$3,750,000 requisition during the campaign. The war between Japan and China covered about nine months and the amount paid by the latter nation was \$185,000,000. For the Turko-Russian war of 1877, Russia demanded \$701,000,000, but her claim was reduced to \$160,000,000. Great Britain has received two indemnities from China, the first, in 1840, being \$25,000,000, and the second, in 1860, about \$10,000,000. The Sultan of Turkey was forced by the powers to reduce his claims of \$50,000,000 on Greece at the close of the war of 1897 to \$10,000,000. The settlement of war claims between the United States

and Spain at the end of the war of 1898 was unique. The American-Spanish War lasted four months, and cost the United States \$150,000,000. The Spaniards were defeated in every battle on sea and land, and finally sued for peace. A treaty was signed by President McKinley and by the Queen Regent of Spain in 1899 by the terms of which the United States relinquished all claims for indemnity of any kind, and agreed to send back to Spain, at its own cost, all Spanish soldiers taken prisoners, with their arms. The United States further agreed to pay to Spain the sum of \$20,000,000. On her part, Spain was to relinquish all claim of sovereignty over Cuba; to cede to the United States the island of Porto Rico, and other islands then under Spanish sovereignty in the West Indies; the island of Guam, in the Ladrões; and the archipelago known as the Philippine Islands. In this case it would appear that the victors paid for their success. At the close of the trouble between China and the powers, growing out of the Boxer uprising in 1900, it was agreed that China pay the powers 450,000,000 taels as an indemnity.

War Office, in Great Britain, the department of government which controls all matters connected with the army. The head of the department is the secretary of state for war. He has a seat in the cabinet, and a salary of \$25,000 a year is attached to his office. In the administration of the department he is assisted by a permanent under-secretary, who receives \$10,000 per annum; by a parliamentary under-secretary, a financial secretary, and other officials. The heads of the different army departments, both military and civil, are responsible to him. The commander-in-chief has command of all troops, and is responsible for their discipline and efficiency; he is the chief adviser of the secretary of state; has to prepare schemes of offense and defense, and recommends officers for promotion, appointments, and honors or rewards. The chief secretary alone is responsible to Parliament.

War of the Pacific, a name given to the war between Chile and Bolivia and Peru in 1879-83. See BOLIVIA; CHILE; PERU.

War Paint, among the American Indians, paint put on the face and other parts of the body on going to war, with the object of making their appearance more terrible to their enemies.

War Path, among the American Indians, the route or path taken on going to war; a warlike expedition or excursion. On the warpath, means on a hostile or warlike expedition; hence, colloquially, about to make an attack on an adversary or measure.

War Tariff, a general name applied to various tariff measures passed by Congress during the Civil War. These bills included a bill raising the tariff of 1857 about one-third, passed 2 March 1861; amended tariff act raising duties passed 5 Aug. 1861; act increasing tariff

WAR TOKENS—WARBLERS

on tea, coffee and sugar, passed 24 Dec. 1861; act raising tariff duties temporarily, passed 14 July 1862; act raising all duties 50 per cent for 90 days, passed 29 April 1864; general revision of tariff, increasing duties, passed 30 June 1864. See U. S.—TARIFF IN THE.

War Tokens. See TOKEN MONEY.

Warbeck, wâr'bĕk, **Perkin**, a pretender to the throne of England in the reign of Henry VII.: b. Tournay about 1475; d. London 28 Nov. 1499. He was the son of a Jew of Tournay and appears in history in 1490, when he was attached to the court of Margaret, dowager duchess of Burgundy. At this court he was taught to represent Richard, duke of York, younger brother of Edward V., one of the princes generally supposed to have been murdered by their uncle Richard of Gloster in the tower. In 1492, when there was prospect of a war between France and England, Warbeck landed at Cork, and was joined by numerous partisans. At the invitation of Charles VIII. he went to the court of France, where he was acknowledged as duke of York, received a pension, and was attended by a body guard. At the peace of Estaples he was dismissed from France and went to Flanders, where he was received by the duchess of Burgundy as her nephew. The belief in the truth of his claim was shared by the populace of England, and certain of the nobility, and some of them openly declared for him. He was, however, taken prisoner after an invasion of Cornwall 1497, tried for high treason and hanged at Tyburn.

Warblers, a popular name applied in different countries to a variety of small insectivorous birds belonging to quite distinct families, but resembling one another in habits and appearance. The American warblers, to which the book name "wood-warblers" is often given, belong to the extensive family *Mniotiltidae* and include a varied assemblage of generic types somewhat closely related to the tanagers (*Tanagridae*). They are small birds, with one or two exceptions about five inches in length. Their colors are bright and varied, yellows often predominating, with patches of red, blue, brown, black or white in conspicuous places; but the females are often plain and often closely resemble one another in the different species. The bill varies, but is generally rather slender, pointed, slightly curved and without a hooked tip, a tooth, or a deep notch; the feet are rather small with scutellate tarsi and present no positive characters; the primary wing-quills are 9, the secondaries are not elongated and the tail-quills are 12 in number. Owing to the great diversity of the genera it is practically impossible to give any brief definition covering all. Various groupings of the genera into sub-families have been proposed, but with the exception of the well marked *Icteriinae*, which are decidedly aberrant, they all intergrade more or less easily. A division such as follows, is convenient and fairly natural. The typical warblers (*Sylvicolinae*) have the wings nearly always longer than the tail, the bill slender and conical, with the commissure slightly curved and the rictal bristles short or wanting. The fly-catching warblers or (*Scotophaginae*) have similar wings and tail, with the bill broad and flattened at the base, the commissure slightly curved, and the

rictal bristles numerous and very long. The chats (*Icteriinae*) have the wings shorter than the tail, the bill high, compressed and stout, with strongly curved commissure and no rictal bristles. They are much larger than any of the members of the other subfamilies.

There are, in round numbers, about 130 species of known warblers, strictly confined to America; the flycatching warblers being found in greatest variety and abundance in northern South America, Central America and the West Indies, while the *Sylvicolinae* are pre-eminently characteristic of North America. Warblers are all insectivorous and migratory, chiefly inhabitants of the woods and thickets, and because of their varied habits and great abundance among the most interesting of our birds. They build on the ground, in bushes, in crevices or high up in tall trees, nests exhibiting a great diversity in material and architecture. The name warbler probably alludes to their constancy rather than to their ability as musicians, for their songs, though attractive and interesting, are, with a few exceptions, not highly melodious. The varied role played by warblers in nature has been well expressed by Dr. Coues in the following poetic passage: "The warblers have we always with us, all in their own good time; they come out of the South, pass on, return, and are away again, their appearance and withdrawal scarcely less than a mystery; many stay with us all summer long, and some brave the winters in our midst. Some of these slight creatures, guided by unerring instinct, travel true to the meridian in the hours of darkness, slipping past 'like a thief in the night,' stopping at daybreak from their lofty flights to rest and recruit for the next stage of the journey. Others pass more leisurely from tree to tree, in a ceaseless tide of migration, gleaming as they go; the hardier males, in full song and plumage, lead the way for the weaker females and yearlings. With tireless industry do the warblers befriend the human race; their unconscious zeal plays due part in the nice adjustment of Nature's forces, helping to bring about that balance of vegetable and insect life without which agriculture would be in vain. They visit the orchard when the apple and pear, the peach, plum and cherry are in bloom, seeming to revel carelessly amid the sweet-scented and deliciously tinted blossoms, but never faltering in their good work. They peer into the crevices of the bark, scrutinize each leaf, and explore the very heart of the buds, to detect, drag forth and destroy those tiny creatures, singly insignificant, collectively a scourge, which prey upon the hopes of the fruit-grower, and which, if undisturbed, would bring his care to naught. Some warblers flit incessantly in the terminal foliage of the tallest trees; others hug close to the scored trunks and gnarled boughs of the forest kings; some peep from the thicket, the coppice, the impenetrable mantle of shrubbery that decks tiny water courses, playing hide-and-seek with all comers; others, more humble still, descend to the ground, where they glide with pretty mincing steps and affected turning of the head this way and that, their delicate flesh-tinted feet just stirring the layer of withered leaves with which a past season carpeted the ground. We seek warblers everywhere in their season; we shall find them a continual surprise."

WARBLERS

Of the Sylvicolinæ 9 genera and 46 species are North American, the principal genera being *Dendroica*, the largest by far, *Helminthophila* and *Geothlypis*. The diagnostic colors of many are sufficiently indicated by their vernacular names, which, however, are generally descriptive of the full-plumaged males only. The black and white creeping warbler (*Mniotilta varia*) has the sexes similarly colored and is a common migratory woodland species throughout eastern North America, breeding from Virginia northward and wintering from the Gulf coast into South America. In feeding habits it resembles the brown creeper rather than the other warblers, climbing the tree trunks and larger branches by clinging to the bark, searching the crevices for insects and their eggs, but not using the tail as a prop. The song is a feeble unmusical trill, but the call notes are varied. A simple nest on the ground of bark, moss, grass, etc., contains 4 or 5 eggs, white with profuse reddish brown spots. *Protonotaria* includes only *P. citrea*, the prothonotary warbler, a beautiful species whose prevailing color in both sexes is golden with olivaceous and bluish above and the tail-quills largely white; the bill is unusually long, acute and black. It breeds in most of the United States east of Nebraska, but is rare in the east north of Virginia. It haunts swampy woods and thickets and nests in holes of trees. An interesting species of striking aspect is the worm-eating warbler (*Helminthorus vermicivorus*), with a stout acute bill without bristles, a very short tail and strong feet. In both sexes the back is olivaceous, the under parts buff, and the head conspicuously marked with four longitudinal black stripes. A common bird of the eastern United States west to Nebraska and north to southern New England, breeding over this range and wintering in the Antilles and northern South America. It is a bird of the woodland undergrowth and nests on the ground, the 4 or 5 eggs being brilliant white with fine dots of reddish brown. The popular name is a misnomer as it does not feed on worms but chiefly on caterpillars and spiders. The best known of the *Helminthophila* is the blue-winged yellow warbler (*H. pinus*) having about the limits of range of the last and much resembling it in habits though they are more active and arboreal and often frequent the shrubbery of parks and well-kept grounds. The Nashville warbler (*H. ruficapilla*) is a plain species; the males in breeding, dress olive above, yellow below, the latter remaining even in the duller autumn colors and the female. Except in the extreme northern States this species is a migrant only, but very common in the United States, breeds in the British provinces and winters in Mexico and Central America. This genus also includes the golden-winged, Tennessee, and orange-crowned warblers of the eastern United States, and several western species, besides some rarities which are supposed to be hybrids. No warbler is better known than the little gaily-dressed parula or blue yellow-backed warbler (*Compothlypis americana*) which breeds in the United States and lower Canada west to the great plains and winters in the West Indies and Central America. They are very common in open woods during the migrations and distributed more locally in swampy districts and river valleys during the breeding

period, probably attracted by the abundance of the long stemmed *Usnea* or "Spanish moss," of which their beautiful, usually globular hanging nests, are in chief part constructed. Like the *Dendroica* these are true tree-warblers, incessantly flitting about the outermost twigs, turning and hanging in every conceivable attitude and often taking short flights in pursuit of flying insects.

Dendroica comprises 24 species of the warblers found within our limits. Most of them glean for their food in the terminal twigs of trees much as does the parula, and like it their songs are simple feeble trills. They come in troops when the forest trees are bursting into leaf in May and most of them pass to the British provinces or at least to the northern woods and high mountain ridges to breed, but a few, like the yellow warbler, remain through the summer. With few exceptions they never nest on the ground. The males in breeding plumage are handsomely and variously colored, but nearly always have much white on the tail quills, the female, young and male autumn plumage is generally very different. One of the best-known but hardly a good representative example is the yellow or summer warbler (*D. aestiva*), one of the few species which has an extensive breeding range in the United States. It is abundant almost everywhere in North America and its warm glowing yellow color and the absence of white from the tail are diagnostic. It is less of a woodland bird than many of the others and frequents orchards, parks and roadside thickets, building a pretty nest, compactly felted of soft vegetable fibres, bits of wool, paper, etc., securely wedged in the upright fork of a bush or low tree. More than one brood of 4 or 5 young is sometimes raised and these birds often outwit the cowbird which drops an egg in their nest, by covering the intruder with a false floor and hatching their own brood above it. The spring song of the yellow warbler is very sprightly. Other species which breed over considerable areas in the United States are the cerulean warbler (*D. carulea*, chestnut-sided warbler (*D. pennsylvanica*), yellow-throated warbler (*D. dominica*), pine warbler (*D. vigorsii*), and prairie warbler (*D. discolor*) in the east, and the black-throated gray warbler (*D. nigrescens*), Townsend's warbler (*D. townsendi*), hermit warbler (*D. occidentalis*) and golden-cheeked warbler (*D. chrysoparia*) in the west. Well-known migrant species, which breed in Canada and more or less in our northern border States and along the high mountain ridge southward even to North Carolina and Georgia, are the Cape May warbler (*D. tigrina*), black-throated blue warbler (*D. carulescens*), yellow-rumped or myrtle warbler (*D. coronata*), which lingers into the winter even in the latitude of Philadelphia, magnolia warbler (*D. maculosa*), bay-breasted warbler (*D. castanea*), the beautiful black and orange Blackburn's warbler (*D. blackburnia*), black-throated green warbler (*D. virens*), and the eastern palm warbler (*D. palmarum hypochrysea*).

Very distinct in appearance from all of the above are the members of the genus *Sciurus*, of ground-loving habits and thrush-like plumage, brownish above and streaked or spotted below. We have three species. The golden-crowned thrush or oven-bird (*S. aurocapillus*) slightly exceeds six inches in length, and both sexes

WARBLERS

are of a rather bright olive color above, with a golden crown-streak bounded by black. It inhabits the greater part of North America and breeds from Virginia and Kansas northward, building its over-arched nest of leaves and grasses on the ground and laying therein 4 to 6 white eggs thickly speckled with brown and lilac. The oven-bird is very common in the summer in the New England and Middle States, inhabiting low damp woods and living mostly on or near the ground, searching for its chiefly insect food among the fallen leaves. Besides its ordinary loud clear whistled song, it has an exquisitely sweet nuptial song seldom heard. The common water-thrush or water-wagtail (*S. noveboracensis*) is slightly smaller and of a nearly uniform rich olive-brown above, pale yellow, streaked with brown below. Its breeding range is northerly in the eastern United States to Illinois, and to the Arctic, and it winters in middle America. The water-thrush inhabits woodlands in the vicinity of streams and swamps and resembles the wagtails in its habit of wading and raising the tail to balance the body on its insecure footing. The nest of leaves, grasses and fine roots is built on the ground in the shelter of a log and the crystalline white eggs profusely speckled with brown number 4 to 6. A related species of similar habits, the large-billed or Louisiana water-thrush (*S. motacilla*), is more southern in range but very similar in appearance. Both are exquisite songsters.

Geothlypis contains a group of ground-warblers with the feet stout and the wings generally very short and exceeded in length by the tail. A typical very common, and wide ranging species is the Maryland yellow-throat (*G. trichas*) which breeds from Georgia to Labrador. The male is a handsome bird, olive above, chiefly clear yellow below, the face with a broad rich black mask which the female lacks. It lives in thickets and shrubbery, especially where the ground is low and wet. The nest is skilfully concealed in tufts of herbage on the ground and is constructed of leaves, twigs, grass, rootlets, etc. The 4 to 6 eggs are white and rather sparingly spotted about the large end with brown. The song is a loud, clear, lively whistle sung with great energy. A related species is the Kentucky warbler (*G. formosa*), which differs in having in place of the black mask a black crown and a black bar running obliquely downward and backward from the eye and between them a yellow superciliary stripe. It is more southern than the yellow-throat, but breeds throughout the eastern United States. Much less common than the yellow-throat its habits are essentially similar, but it is a bird more of the woodland borders and underbrush than of the swampy thickets. Other species are the mourning warbler (*G. philadelphia*), the Connecticut warbler (*G. agilis*), and several southern and western species closely similar to the Maryland yellow-throat.

Coming now to the *Setophagina*, we find five genera and 10 species recorded as North American, six of which are Mexican and scarcely or not at all cross the borders of the United States. The remaining four are generally common eastern birds. Typical of the subfamily is the redstart (*Setophaga ruticilla*), not at all related to the redstart of Europe. The male is a handsome bird of lustrous black plumage, the belly white, and the wing lining,

a patch on the primaries and one on each side of the tail quills of rich orange which appears and disappears as the bird opens and closes these parts in its never ceasing activity in the pursuit of insects among the outer foliage of trees and the surrounding air. As a catcher of flying insects the redstart is very skilful; its song is lively and pleasing and its nest a neatly felted cup of soft vegetable fibres in an upright fork of a small tree. It is found throughout most of North America and breeds in the northern half of the United States and in Canada. The Canadian fly-catching warbler (*Sylvania canadensis*) is bluish ash above, rich yellow below, with numerous small black streaks on the crown and more distinct ones on the throat, and a black band running backward from the eye. This handsome species is found from the base of the Rocky Mountains eastward and breeds from southern New England and New York to Newfoundland. It is abundant during the migrations and spends much of its time making short flights to secure passing insects, from which it immediately returns to its unending activity in the higher branches of the trees. The nest is on the ground and the eggs of the usual warbler type. Two related species are the hooded warbler (*S. mitrata*) and the black-capped warbler (*S. pusilla*), both chiefly yellow, the first with a black cap and throat and a rich yellow face mask, the last smaller and with the black confined to the crown. The hooded warbler is chiefly southerly and hardly reaches the northern limits of the United States, but breeds southward to the Gulf coast, building its nest in low bushes. The black-cap, on the other hand, is even more northerly and has a wider western range than the Canadian warbler, but like it nests on the ground.

Of the *Icterina* our fauna contains but a single genus and species, the yellow-breasted chat (*Icteria virens*), isolated in structure and standing quite apart from the other warblers; and in manners equally unique. The length is about $7\frac{1}{2}$ inches, the color clear olive-green above; the throat, breast and sides bright rich yellow; the belly, superciliary and maxillary stripes and a spot below the eye, white; the cheeks and lores black, and the bill blue-black. The form is stout and the wings much shorter than the tail. In two subspecies the yellow-breasted chat inhabits the entire United States except the northern tier. It is locally abundant, living in tangled thickets on warm hillsides and sheltered valleys, and building a loose but pretty nest of leaves, plant stems, strips of bark and grass in the thickest patches of briers, often in association with many of its fellows. The eggs, which are about an inch long by four fifths of an inch in diameter, are usually 3 or 4 in number, variously spotted and blotched with brown and lilac. The chats are among the most remarkable of our songsters, but have no definite song, producing a constant succession of extraordinary sounds with much force and expression. Some are clear whistles endlessly modulated and combined, some are hoarse guttural notes, some sharp coughing sounds, some cat-like mews, some are original, others imitated, but all are uttered with a vehemence and abandon that is quite inimitable. Few birds surpass the chat in imitative or ventriloquistic powers and few combine their nuptial song, which is heard both

by night and day, with such a series of grotesque aerial antics.

The warblers of Europe belong to the family *Sylviidae*, related to the thrushes and by many ornithologists combined with these and other birds in the family *Turdidae* used in a wide sense. The *Sylviidae* have the bill of moderate length and slender form, broad at the base and tapering towards the extremity. The tip of the upper mandible is curved downwards, and is slightly notched. The wings are elongated with ten primaries and the tail has often only 10 quills, the tarsi long and slender. The family includes a variety of sub-families and a large number of genera, presenting quite as varied an array of structures and habits as do the *Mniotiltidae* and quite as difficult to classify. All are small insectivorous and mostly plain-colored birds. They are especially characteristic of Eurasia, though some breed in Australia, New Zealand and the Polynesian Islands. *Regulus* and *Phylloscopus* inhabit North America. To this group belongs the genus *Sylvia*, represented by such forms as the white-throat (*Sylvia undata*), garden warbler (*S. hortensis*), chiff-chaff (*S. rufa*), and other equally notable species elsewhere described.

Besides an Asiatic species (*Phylloscopus borealis*) which extends its breeding range into Alaska the only North American representatives of this very extensive family are four species of *Regulus*, diminutive little birds known as kinglets (q.v.). The dainty little gnatcatchers (q.v.) of which three species are North American, and which with their allies form the family *Poliophtidae*, are very closely related to the *Sylviidae*. Some of the flycatching *Muscicapidae* are called warblers in Australia.

Warburton, wâr'bér-tôn, William, English prelate: b. Newark-upon-Trent, Nottinghamshire, 24 Dec. 1698; d. Gloucester 7 Jan. 1779. He studied law and practised in Newark, but soon gave up this profession and in 1723 took orders in the English Church, becoming rector of Brant Broughton, Lincolnshire, in 1728. In 1726 he formed an acquaintance with Theobald, to whose edition of Shakespeare he contributed. In 1727 he began to distinguish himself as an original writer by his inquiry into the 'Causes of Prodiges and Miracles,' and in 1736 appeared his 'Alliance between Church and State, or the Necessity and Equity of an Established Religion and Test Law.' The first volume of his chief work was published in 1737, entitled 'The Divine Legation of Moses demonstrated on the Principles of a Religious Deist from the Omission of the Doctrine of a Future State of Rewards and Punishments in the Jewish Dis-

pensation.' This paradoxical performance met with adversaries among all parties, who concurred in criticising and censuring the theory on which it is founded, and he replied to his critics in a vindication of his opinions. Having published in the journal called the 'Works of the Learned,' in 1739 and 1740, a defense of the 'Essay on Man' against the remarks of De Crousaz of Geneva, Pope acknowledged his obligations to Warburton, and an intimacy was established. On his death in 1744 Pope bequeathed to Warburton half his library, and the copyright of such of his works already printed as were not otherwise disposed of. In 1747 Warburton appeared as the editor of Shakespeare, and proved himself to be but a poor commentator. In 1750 appeared 'Julian, or a Discourse concerning the Earthquake and Fiery Eruption which defeated that Emperor's Attempt to rebuild the Temple, elicited by Middleton's Inquiry concerning the Miraculous Powers of the Christian Church.' In 1757 he became dean of Bristol, and two years after bishop of Gloucester. In 1768 he established a lecture at Lincoln's Inn on the evidence in favor of Christianity from the prophecies of the Old and New Testaments. His collected works were published by Hurd in 1788. Consult the biography of Watson (1863); and Mark Pattison, 'Essays' (1889).

Ward, wârd, Adolphus William, English historian: b. Hampstead 2 Dec. 1837. He was graduated from Peterhouse College, Cambridge, and became a fellow of his college. In 1866 he was appointed professor of history and English literature in Owens College, Manchester, an institution of which he was principal from 1888 till his resignation in 1897. He took a leading part in the movement for the foundation of Victoria University, and in 1900 became master of Peterhouse. He published a translation of Curtius' 'History of Greece' (1868-73), and in 1875 his valuable 'History of English Dramatic Literature to the Death of Queen Anne' appeared (new ed. 1899). Among his other works are: 'The House of Austria in the Thirty Years' War' (1869); 'Chaucer' (1880), and 'Dickens' (1882) in 'English Men of Letters' series; 'The Counter-Reformation' (1888); 'Sir Henry Wotton' (1897); 'Great Britain and Hanover' (1899); and numerous contributions to the 'Encyclopædia Britannica' and the 'Dictionary of National Biography.'

Ward, Artemas, American general: b. Shrewsbury, Mass., 1727; d. there 28 Oct. 1800. He was graduated at Harvard College in 1748; early entered public life as a representative to the general court; became a member of the executive council and a justice of the court of common pleas of Worcester County. In the French and Indian War he served as lieutenant-colonel under Abercrombie and at the opening of the Revolutionary War was in command of the besieging forces at Boston till the arrival of Washington, after which he was stationed with the right wing on Roxbury Heights. He resigned his commission of major-general, in April 1776, but at the request of Washington continued to serve till the end of May. He was president of the Massachusetts executive council in 1777, a member of the legislature for 16 years, and sat in Congress 1780-1 and 1791-5.

WARD

Ward, Artemus. See BROWNE, CHARLES FARRAR.

Ward, Edgar Melville: b. Urbana, Ohio, 24 Feb. 1839. He was graduated at Miami University; proceeded to study art at the National Academy of New York 1870-1 and subsequently spent six years in France (1872-8). He is a favorite genre painter and among his pictures are: 'The Sabot Maker'; 'Brittany Washwoman'; and 'The Quilting Party.' He has been a National Academician since 1883 and subsequently was elected professor in the National Academy.

Ward, Edward Matthew, English painter: b. Pimlico, London, 14 July 1816; d. Slough 15 Jan. 1879. His first studies were pursued in the studio of John Cawse, London, and in 1835 he entered the Royal Academy schools. During the three years 1836-9 he was in Paris, Venice and Rome; and studied fresco-painting with Cornelius at Munich. His first noteworthy picture was 'Cimabue and Giotto,' exhibited at the Royal Academy (1839). From that time he was a regular contributor to the Academy's annual exhibition, and in 1855 was elected academician. In 1853 he was commissioned to paint eight pictures for the corridor of the House of Commons, their subjects being: 'The Execution of Montrose'; 'The Last Sleep of Argyll'; 'Alice Lisle concealing Fugitives'; 'Monk declaring for a Free Parliament'; 'The Escape of Charles II. with Jane Lane'; 'The Landing of Charles II.'; 'The Acquittal of the Seven Bishops'; and 'William and Mary receiving the Lords and Commons.' He died from the effects of a self-inflicted wound. His numerous oil paintings were historical and genre, and among the best of them are: 'Dr. Johnson reading the Manuscript of the Vicar of Wakefield' (1843); 'A Scene from the Early Life of Goldsmith' (1844); 'A Scene in Lord Chesterfield's Ante-room in 1748' (1845), now in the Tate Gallery; 'Charles II. and Nell Gwyn' (1848), in the South Kensington Museum; 'The Royal Family of France in the Temple' (1851); 'Charlotte Corday going to Execution' (1852); the 'Ante-chamber at Whitehall during the Dying Moments of Charles II.' (1861); 'Hogarth's Studio, 1739' (1863); 'Luther's First Study of the Bible' (1860), now owned by the British and Foreign Bible Society; 'The Eve of Saint Bartholomew' (1873); 'Marie Antoinette in the Conciergerie' (1874); etc. Many of these are well known in engravings. Consult: Dafforne, 'Life and Works of E. W. Ward' (1879).

Ward, Elizabeth Stuart Phelps, American novelist and poet, daughter of Austin Phelps (q.v.): b. Andover, Mass., 31 Aug. 1844. In 1888 she was married to H. D. Ward (q.v.), with whom she has sometimes collaborated. Her first work to attract attention was 'The Gates Ajar' (1868), which had a very wide reading and was instrumental in substituting reasonable healthy views concerning a future existence in place of the vague and conventional ideas on the subject then prevalent in religious circles. She has been a voluminous writer, among her later works being: 'Men, Women, and Ghosts' (1869); 'The Silent Partner' (1870); 'Hedged in' (1870); 'The Story of Avis' (1877); 'Beyond the Gates' (1883); 'Dr. Zay' (1884); 'The Gates Between' (1887); 'Poetic Studies,' verse (1875); 'Songs of the

Silent World' (1884); 'The Struggle for Immortality' (1889), a volume of essays; 'A Singular Life' (1895); 'The Story of Jesus Christ' (1897). Her work is marked by originality as well as intensity of feeling and strength of moral purpose, but the note sounded is sometimes too shrill for the occasion.

Ward, Henry Augustus, American naturalist: b. Rochester, N. Y., 9 March 1834. He was educated at Williams College, and at the Lawrence Scientific School at Harvard, where he was assistant to Prof. Agassiz in the museum of comparative zoology. He studied in Paris and traveled through Europe and the Orient in 1855-9; occupied the chair of natural sciences at Rochester University in 1860-5; and in 1866-9 was manager of gold mines in Montana and South Carolina. He was engaged in traveling in various countries of the world in 1870-1900, collecting cabinets of mineralogy and geology, which he distributed among the colleges and universities of the United States. He founded at Rochester Ward's Natural Science Establishment, was naturalist to the United States expedition to Santo Domingo in 1871, and has written: 'Notices of the Megatherium Cuvieri'; and 'Description of the Most Celebrated Fossil Animals in the Royal Museum of Europe.'

Ward, Herbert Dickinson, American author, son of W. H. Ward (q.v.): b. Waltham, Mass., 30 June 1861. He was graduated from Amherst and in 1888 was married to Elizabeth Stuart Phelps (q.v.) with whom he wrote 'The Master of the Magicians' (1890); and 'Come Forth' (1890). Among works of which he is sole author are 'The New Senior at Andover'; 'The Burglar who Moved Paradise' (1897); 'The White Crown and Other Stories' (1894).

Ward, Mrs. Humphry. See WARD, MARY AUGUSTA ARNOLD.

Ward, James, English artist: b. London 23 Oct. 1769; d. Cheshunt, Hertfordshire, 23 Nov. 1859. He studied the engraver's art in his boyhood and also early turned his attention to painting, in which he was a pupil of Morland who married his sister. He was elected R.A. in 1811. His first painting was exhibited in 1790, and from that time to his death he produced numerous pictures of different types, though his best work was done in the painting of animals. His most important works are: 'Bull-baiting' (1797); The 'Alderney Bull, Cow, and Calf in a Meadow' (1820-2), his masterpiece, now in the National Gallery, painted in rivalry with Paul Potter's celebrated picture; 'Allegory of Waterloo' (1817), a sketch for the British Institution which he afterward painted larger with less success; 'Gordale Scar, Yorkshire,' in the National Gallery (this great picture with its noble group of cattle which was presented by Lord Ribblesdale to the British Museum with a view to its transference to the British Museum was rolled up and consigned to a cellar until 1858, though it eventually reached its destination in 1878); 'Harlech Castle,' also in the National Gallery; 'Regent's Park in 1807'; 'A Cattle Piece,' also in the National Gallery; 'Bulls Fighting in a Landscape,' a work of great merit, now in the South Kensington Museum; 'Donkey and Pigs,' also in the museum at South Kensington; 'Pigs,' and 'A Chinese Sow,' in the same collection;

WARD

'The Council of Horses,' in the Manchester Gallery; and 'De Tabley Park,' in the Oldham Gallery. Among his engravings the most noteworthy are after Rembrandt, Hoppner, Rubens, Northcote, Morland, and Reynolds. As an engraver he was not less successful than as a painter and a complete set of impressions of all his plates, in their different states, 300 in all, was presented by him to the British Museum before his death.

Ward, John Henry Hobart, American soldier: b. New York 17 June 1823; d. Monroe, N. Y., 25 July 1903. He entered the United States army in 1841, was appointed sergeant-major in 1845, served through the Mexican War, and was afterward successively assistant commissary-general and commissary-general of New York. He organized a regiment of volunteers at the outbreak of the Civil War, was appointed colonel, and was engaged at the first battle of Bull Run. He later participated in the Peninsular campaign, in the second battle of Bull Run, and on 4 Oct. 1862 was promoted brigadier-general of volunteers. He was subsequently engaged with the Army of the Potomac and was in command of a brigade at Fredericksburg, Chancellorsville, Gettysburg, the Wilderness, Spottsylvania, and other important battles. He was honorably mustered out of service 21 July 1864 and from 1870 until his death was clerk of the superior court of New York city.

Ward, John Quincy Adams, American sculptor: b. Urbana, Ohio, 29 June 1830. In 1850 he entered the studio of Henry K. Browne, where he studied six years. In 1861 he opened a studio in New York, where as the fruits of his residence in the Indian country, he modeled his 'Indian Hunter.' This was followed by 'The Good Samaritan,' 'Commodore M. C. Perry,' with reliefs and 'The Freedman.' Among his best known work in later years he produced the 'Citizen Soldier,' and statues of 'Shakespeare,' 'General Reynolds,' 'General Washington,' 'General Israel Putnam,' 'General Thomas,' 'General Daniel Morgan' and 'Lafayette.' He subsequently modeled the colossal statue of 'Washington' for the New York sub-treasury building, a colossal statue of 'President Garfield' and 'The Pilgrim.' The crowning group of 'Victory' in the arch for the Dewey reception in New York in 1899 was also his work. For three years he was vice-president, and for one term president of the National Academy of Design, and is a trustee of the Metropolitan Museum of Art.

Ward, Lester Frank, American geologist: b. Joliet, Ill., 18 June 1841. Graduated from Columbian University in 1869, he was assistant-geologist in the United States geological survey in 1881-8, and geologist in 1888. He made especial investigations in the field of palaeobotany. Among his publications are: 'Guide to the Flora of Washington and Vicinity' (1881); 'Sketch of Palaeobotany' (1885); 'Types of the Laramie Flora' (1887); 'Geographical Distribution of Fossil Plants' (1888); 'Outlines of Sociology' (1898); and 'Pure Sociology' (1903).

Ward, Lydia Avery Coonley, American writer: b. Lynchburg, Va., 31 Jan. 1845. She was married in 1867 to J. E. Coonley (d. 1882)

and in 1897 to H. A. Ward, and was president of the Chicago Woman's Club 1895-6. She has published 'Under the Pines and Other Verses' (1895); 'Our Flag,' a cantata, with music by G. F. Root (1896); 'Singing Verses for Children' (1897); 'Love Songs' (1898).

Ward, Mary Augusta Arnold, English novelist: b. Hobart, Tasmania, 11 June 1851. She is a daughter of Thomas Arnold (q.v.), second son of Dr. Thomas Arnold of Rugby and in 1872 was married to Thomas Humphry Ward. Her father, having become a Roman Catholic, gave up his educational post in Tasmania and returned to England in 1856 and there his daughter was educated. The father held appointments at Dublin and Birmingham, and after 1885 resided at Oxford, where she also lived with her husband till they removed to London in 1880. Her long residence in Oxford and consequent familiarity with the intellectual atmosphere of the university no doubt gave her that inclination toward ethical discussion which has so markedly influenced the character of her writing. In 1890 she was one of the principal founders of University Hall, a settlement among the poor in the Saint Pancras district of London, and since 1897 occupying a spacious building near Tavistock Square, erected for that purpose by Passmore Edwards. In the work of this settlement Mrs. Ward has put a vast amount of personal endeavor and thought, and its influence has been commensurate with the pains that have been taken in its behalf. Mrs. Ward's first important literary work was a translation of 'Amiel's Journal' (1885), but prior to this she had published 'Milly and Olly,' a child's story. These were followed by 'Miss Bretherton,' a story (1886); and 'Robert Elsmere' (1888), which brought her almost immediately a world wide fame, being translated into several languages, and having an immense sale. Later works of hers are 'The History of David Grieve' (1892); 'Marcella' (1894); 'Sir George Tressady' (1896); 'Helbeck of Bannisdale' (1898); 'Eleanor' (1900); 'Lady Rose's Daughter' (1902). She has also published 'Unitarianism and the Future' (1894). All of Mrs. Ward's novels display much intellectual power and intensity of moral purpose, and her influence upon the social and ethical thought of the last 10 or 15 years in England and the United States has not been inconsiderable. Her novels are of varying degrees of excellence, but while all are worthy of serious attention, 'Helbeck of Bannisdale' is perhaps the most powerfully conceived since 'Robert Elsmere.'

Ward, May Alden, American writer and lecturer: b. Cincinnati, Ohio, 1853. She was graduated from the Ohio Wesleyan University in 1872 and in 1873 was married to W. G. Ward (b. 1848) (q.v.). She has been president of the Massachusetts State Federation of Woman's Clubs from 1901, has lectured widely and is the author of 'Life of Dante' (1887); 'Petrarch: His Life and Works' (1891); 'Old Colony Days' (1896); 'Prophets of the 19th Century' (1900).

Ward, Nathaniel, English Puritan divine: b. Haverhill, Suffolk, 1578; d. Shenfield, Essex, 1652. He was educated at Emmanuel College, Cambridge, traveled widely on the Continent, took orders in 1618, and from 1620 to 1624

WARD

appears to have been chaplain to the colony of British merchants at Elbing, Prussia. On his return to England, he was curate of Saint James', Piccadilly (1626-8), and subsequently rector of Stondon Massey, Essex. On account of his Puritan views he was frequently cited before Laud, who finally (1633) deprived him of the living. He emigrated in 1634 to Massachusetts, and became minister to a settlement at Agawam, later called Ipswich. This post, because of ill-health, he resigned in 1636. In 1639 he was appointed, with the Rev. John Cotton (q.v.), to frame the first code of laws for the colony,—the 'Body of Liberties,' passed by the general court in 1641. This compilation is in many respects a remarkable one, and displays wide knowledge of law. Ward was influential in the colonial government; in 1645 he became a member of the committee for the revision of the Massachusetts laws. But he is chiefly known as the author of the "most eccentric and amusing" work written in colonial America. This book, 'The Simple Cobbler of Agawam,' was printed at London in 1647, and passed through four editions in that year. It appeared under the pseudonym of Theodore de la Guard—Theodore being the Greek equivalent of the Hebrew Nathaniel, de la Guard the French for Ward—who turns from his humble last to satirize England old and new. Amid some curious syntax, there is in it an abundance of eloquence and wit, making it still very readable. There is, too, much of the intolerance of the place and time. Ward went back to England in 1646. His 'Cobbler' had gained him some notice, and he preached before the Commons in 1647 and received the living of Shenfield, Essex, in 1648. Among his further publications were the sermon above noted (1647); 'A Religious Retreat Sounded to a Religious Army' (1647); 'To the High and Honorable Parliament, Humble Petitions, Serious Suggestions, and Dutiful Expostulations' (1650); and probably, 'Mercurius Anit-mechanicus' (1648), denouncing the execution of Charles. Consult: Dean, 'Memoir of Nathaniel Ward' (1868); Tyler, 'A History of American Literature' (1878); the 'Collection of the Massachusetts Historical Society, 3d ser., I, VIII.; 4th ser. VII.

Ward, Susan Hayes, American author, sister of W. H. Ward (q.v.): b. Abington, Mass., 26 Nov. 1838. She was educated at Wheaton Seminary, Mass., under Lucy Larcom (q.v.), studied art in New York, Boston, Dresden, and Paris, and later studied at the Woman's Medical College in Boston. She afterward engaged in lecturing on art; was art-critic on the New York 'Independent' in 1883-93; and office editor in 1892-8. Her writings include: 'Christ at the Door' (1872); 'Sabrina Hackett'; 'History of the Broadway Tabernacle' (1901); 'George Hepworth,' a biography (1903); etc.

Ward, Thomas Humphry, English author and journalist: b. Hull 9 Nov. 1845. He was educated at Oxford, and was married to Mary Augusta Arnold, since widely known as Mrs. Humphry Ward, in 1872. He edited 'Ward's English Poets' (1881-2); 'English Art in the Public Galleries of London' (1888); 'The Reign of Queen Victoria' (1887); 'Men of the Reign' (1885); 'Men of the Time' 12th ed.

Ward, Wilfrid Philip, English author, son of W. G. Ward (q.v.): b. Ware, Hertfordshire, 2 Jan. 1856. He was educated at Ushaw College, Durham; and the Gregorian University at Rome, and was lecturer at the former in 1890. He has been a member of the Council of the Catholic Union of Great Britain since 1886, and has published 'The Wish to Believe' (1884); 'The Clothes of Religion' (1886); 'William George Ward and the Oxford Movement' (1889); 'William George Ward and the Catholic Revival' (1893); 'Witnesses to the Unseen' (1894); 'Life and Times of Cardinal Wiseman' (1897).

Ward, William, English Baptist missionary: b. Derby 20 Oct. 1769; d. Serampore, India, 7 March 1823. He was a printer who was licensed as a preacher and going to India in 1799 settled at Serampore. Besides printing various religious works in the Bengali language, he wrote 'An Account of the Writings, Religion and Manners of the Hindoos including Translation from their Principal Works' (1811, 5th ed. 1863), which was long the principal authority upon Indian affairs.

Ward, William G., American educator: b. Sandusky, Ohio, 5 Nov. 1848. He was graduated at Ohio Wesleyan University in 1872, studied theology at Drew Theological Seminary, was president of Spokane College in 1890-2, and professor of English literature at Syracuse University 1893-8. In the last named year he became professor of English literature at the Emerson College of Oratory, Boston, Mass. He has published 'Tennyson's Debt to Environment' (1898); 'The Poetry of Robert Browning' (1898); 'Art for Schools' (1899); 'Studies in Literature' (1901).

Ward, William George, English Tractarian leader and Roman Catholic theologian: b. London 21 March 1812; d. Hampstead, London, 6 July 1882. Educated at Winchester College, he entered Christ Church, Oxford, in 1830, obtained a scholarship at Lincoln College in 1833, was graduated in 1834, and about the same time secured election to a fellowship at Balliol. He then took orders, and was a lecturer in mathematics and logic. He soon became a powerful influence in Oxford life, especially on its religious side, among those more or less affected by him being Archbishop Tait, Benjamin Jowett, Dean Stanley, and the poet Clough. He in turn was profoundly influenced by John Henry Newman, whose famous 'Tract 90' he defended in two pamphlets. The publication, in 1843, of William Palmer's 'Narrative of Events connected with the Publication of Tracts for the Times' produced from Ward in reply his famous work 'The Ideal of a Christian Church considered in comparison with existing Practice' (1844), and the formal condemnation of this book by the university authorities precipitated Ward's reception into the Roman Catholic Church (1845), where he was soon followed by Newman and other Tractarians. In 1851 he became lecturer in moral philosophy in Saint Edmund's College, Ware, and in 1854 the pope gave him the diploma of Ph.D. He resigned his lectureship in 1858, and in the 'Dublin Review,' which he edited 1863-78, contended vigorously on behalf of ultramontane principles. He was founder and leading member of the

WARD — WARDLAW

Metaphysical Society (1869) which included such opposites as Huxley and Martineau. In addition to the works already mentioned Ward wrote: 'On Nature and Grace' (1860); 'Essays on the Philosophy of Theism' (1884), a work of great ability; and many smaller works. Consult: 'William George Ward and the Oxford Movement' (1889); and 'W. G. Ward and the Catholic Revival' (1893), both by his son Wilfrid. See OXFORD MOVEMENT.

Ward, Willian. Hayes, American Congregational clergyman and Orientalist: b. Abington, Mass., 25 June 1835. He was graduated from Amherst in 1856, from the Theological Seminary there in 1859, and was ordained to the ministry in the last named year. He engaged in pastoral work and in teaching, and in 1860-8 he was pastor of the Congregational Church and professor of Latin at Ripon College. He joined the editorial staff of the New York 'Independent' in 1868 and since 1870 has been editor of that publication. He was in charge of the Wolfe exploring expedition to Babylonia in 1884, concerning which he published a 'Report' (1885); and has also written: 'World's Christmas Hymn' with his sister, S. H. Ward (1883); 'Biography of Sidney Lanier' (1885); etc.

Warde, wârd, Frederick, American actor: b. Warrington, Oxfordshire, England, 23 Feb. 1851. He made his first stage appearance in 1867, acted in English cities until 1874, then came to the United States, and for three years was leading man at Booth's Theatre, New York. He afterward supported Edwin Booth and John McCullough, and since 1881 has starred as a tragedian, also lecturing often on Shakespearean and other subjects.

War'den, David Adams, American musician: b. London 1815; d. Philadelphia, Pa., 4 Feb. 1902. He came to the United States before the Civil War and was engaged as organist in various Episcopal churches. During the Civil War period he composed the music for many patriotic songs, among which were 'The Flag's Come Back to Tennessee' and 'All Quiet Along the Potomac.' Both words and music of 'Mother, Don't Weep for Your Boy' and 'Tell Me, Ye Winged Winds' were his and he was also author of a book of chants.

Warden, David Baillie, American scholar: b. Ireland 1788; d. Paris, France, 8 Oct. 1845. He came to the United States when very young, received a classical education, was graduated from the New York Medical College; and in 1804 he was appointed secretary of the United States legation at Paris. He subsequently became consul and continued in that office until his death. His 'Statistical, Political, and Historical Account of the United States of North America' (3 vols. 1819) was later published in both French and German, and his other writings include: 'Inquiry concerning the Intellectual and Moral Faculties and Literature of the Negroes' (1810); 'Recherches sur les antiquités de l'Amérique septentrionale' (1827); 'L'Art de vérifier les dates, chronologie historique de l'Amérique' (10 vols. 1826-44); 'Bibliotheca Americana' (1831); etc.

Warden, Florence. See JAMES, FLORENCE.

Warden, the title in the United States of certain public officers, such as game-wardens,

who enforce the game laws, port-wardens, who are harbor officers, and the wardens of prisons.

In the Protestant Episcopal Church the church-wardens are two parochial officers, chosen annually at the Easter vestries, one by the minister, and one by the parishioners. Their duties are to protect the church-building and its appurtenances, to superintend the ceremonies of divine worship, and generally to act as the legal representatives of the parish.

In England the heads of All Souls, Keble, Merton, Wadham, and New colleges at Oxford are known as wardens. The Lord Warden of the Cinque Ports is an official with merely nominal duties now, though he was formerly of much importance. Lord Wardens of the Marches were formerly appointed to keep the disturbed border counties of England in a state of defense against the Scotch.

Wardha, wûr'dâ, or Wurdha, India, (1) the chief town of the district of the same name, Central Provinces, on the left bank of the Wardha River, 40 miles southwest of Nagpur and 471 east of Bombay. It was founded in 1866; as a junction station on the railway it has become a centre of the cotton trade. (2) The district, which was formed out of Nagpur in 1862, has an area of 2,401 square miles. The staple crops are millet, cotton, wheat, and rice. Here is produced the well-known Hinganghat cotton, which is exported to the amount of 25,000 bales a year. The breed of cattle is good, especially the trotting bullocks. A railway crosses the centre of the district. (3) The Wardha River rises in the Satpura hills, and flows southeast for 254 miles to join the Weingunga; the united stream, under the name of the Pran-hita, ultimately falls into the Godavery at Sironcha.

Wardian Cases are boxes covered with tight-fitting frames of glass, under which plants are successfully raised that could not be grown in the vitiated atmosphere of some cities or dwellings. They were invented by N. B. Ward, a surgeon of London, in 1836. Plants have been successfully transported long distances packed in these cases.

Ward'law, Elizabeth, LADY, Scottish poet: b. 1677; d. 1727. She was the daughter of Sir Charles Halkett, of Pitfirrane, and in 1696 married Sir Henry Wardlaw, of Pitreavie, near Dunfermline. Her ballad, 'Hardyknute, a Fragment,' was first published in 1719 as an antique, and after enlargement from 216 to 336 lines, had been several times reprinted, when Percy in the second edition of his 'Reliques,' revealed its authorship. To Lady Wardlaw has also been ascribed, 'Sir Patrick Spens,' 'The Douglas Tragedy,' and many more traditional Scotch ballads. This is highly improbable. "Hardyknute," says Sir Walter Scott, "was the first poem I ever learnt, the last I shall ever forget."

Wardlaw, Ralph, Scottish Congregational clergyman: b. Dalkeith 22 Dec. 1779; d. near Glasgow 17 Dec. 1853. He at first studied divinity with the view of becoming a minister of the Associate Secession Church, but having been led to change his views on the subject of ecclesiastical polity, he was settled in charge of a congregation in Glasgow, where he continued to officiate to the close of his life.

WARD'S ISLAND — WARE

In 1811 he was appointed professor of systematic theology in the Congregational seminary in Glasgow. Both as a lecturer and as a preacher his abilities were of the first order. Of his numerous publications may be cited: 'Discourses on the Socinian Controversy' (1814); 'Essays on Assurance of Faith, and Extent of the Atonement and Universal Pardon' (1830); 'Christian Ethics' (1832); 'National Church Establishments Examined' (1839); 'Lectures on Female Prostitution' (1842); 'Congregational Independency' (1847).

Ward's Island, an island in East River, lying northeast of the Borough of Manhattan, New York city, and forming the northern boundary of Hell Gate. It is roughly circular in shape, and includes about 200 acres. It is the property of the city of New York, and contains a State Insane Asylum, a home for invalid soldiers, a home for children, and the State Emigrant Hospital.

Ware, wār, Henry, American Unitarian divine: b. Sherburne, Mass., 1 April 1764; d. Cambridge, Mass., 12 July 1845. He was graduated at Harvard in 1785, for two years studied theology, and in 1787 became pastor of the First Church at Hingham, Mass., where he remained until 1805, and then accepted the Hollis professorship of divinity at Harvard. At this time Unitarian views were beginning to cause dissension in the New England churches, and the appointment of Ware, a leader of Unitarian thought, to this position in the college brought on a memorable controversy, in which he took a prominent part, particularly in his 'Letters Addressed to Trinitarians and Calvinists' (1820), in answer to the 'Letters to Unitarians' by Leonard Woods, a professor at the Andover Theological Seminary. Ware also published 'An Answer to Dr. Woods' Reply' (1822); 'A Postscript to an Answer,' etc. (1823); 'Foundation, Evidences, and Truth of Religion' (1842); and other writings. He resigned his professorship in 1840, but was at the head of the Harvard Divinity School from its establishment in 1826 until his death.

Ware, Henry, Jr., American Unitarian divine and author, son of Henry Ware (q.v.): b. at Hingham, Mass., 21 April 1794; d. Framingham, Mass., 22 Sept. 1843. He was graduated at Harvard in 1812; was instructor at Phillips Exeter Academy, 1812-14; studied theology at Harvard under his father, and in 1817 became minister of the Second Church, Boston. From 1830 to 1842 he was professor of pulpit eloquence and pastoral care in the Harvard Divinity School, and in 1819-22 was one of the editors of the 'Christian Disciple,' afterward the 'Christian Examiner,' an organ of Unitarian thought. He took an active part in the organization of the Unitarian movement. Among his writings are: 'Hints on Extemporaneous Preaching' (1824); 'On the Formation of the Christian Character' (1831); 'Life of the Saviour' (1832); 'Scenes and Characters Illustrating Christian Truth' (1837); various memoirs; and compositions in verse.

Ware, William, American Unitarian clergyman and author: b. Hingham, Mass., 3 Aug. 1797; d. Cambridge, Mass., 19 Feb. 1852. He was graduated at Harvard in 1816, studied theology under his father, Henry Ware (q.v.) at

Cambridge, held pastorates at Northboro, Mass., Brooklyn, Conn., and Burlington, Vt., and from 1821 to 1836 was minister of the First Unitarian Church, New York. He afterward preached for short periods at several other places, all near Boston, was proprietor and editor of the 'Christian Examiner' (1839-44), and published: 'Letters from Palmyra' (1837), first published in the 'Knickerbocker Magazine,' subsequently republished as 'Zenobia, or the Fall of Palmyra' (new ed. 1868); 'Probus, or Rome in the 3d Century' (1838), republished as 'Aurelian' (new ed. 1868); 'Julian, or Scenes in Judea' (1841); 'Sketches of European Capitals' (1851); 'Lectures on the Works and Genius of Washington Allston' (1852); and a 'Life of Nathaniel Bacon,' in Sparks' series. He edited 'American Unitarian Biography' (1850).

Ware, William Robert, American architect, son of Henry Ware, Jr. (q.v.): b. Cambridge, Mass., 27 May 1834. He was graduated at Harvard (1852) and at the Lawrence Scientific School (1856). He practised architecture at Boston (1860-81). In 1865 he was appointed professor of architecture in the Massachusetts Institute of Technology and since 1881 has filled the same chair in Columbia University. Among his writings are 'Modern Perspective'; 'The American Vignola.'

Ware, Mass., town in Hampshire County; on the Ware River, and on the Boston & M., and the Boston & A. R.R.'s; nearly in the centre of the State, about 25 miles northeast of Springfield, and about the same distance west of Worcester. It was settled in 1673 by Jabez Olmstead, and on 25 Nov. 1761 was incorporated as a precinct, and in 1775 was made a town. The town has a general elevation of about 550 feet above sea-level. The waterworks are owned and operated by the town. The chief manufacturing establishments are cotton, woolen, and hosiery factories, shoe factories, and machine shops. The government census of 1900 gives the number of manufacturing establishments 100; the number of employees in manufactories, 2,777; the amount of wages paid annually, \$979,930; the total cost for material used during the year \$2,119,178; and the value of the products \$3,681,069. From 1900 to 1904 there has been considerable increase of industrial interests and the number of employees are now (1904) about 3,500. The surrounding farms and the nearby manufacturing villages contribute to Ware's industrial prosperity. There are seven churches, a public high school, established in 1850, public and parish graded schools, and a public library which contains about 12,000 volumes. There is one national and one savings bank; the national bank is capitalized for \$300,000 and has deposits amounting to \$321,730. The savings bank, a State institution, has deposits amounting to \$4,009,350 (1 Jan. 1904). The government is administered by means of town meetings, at which, by popular vote, the town officers are elected. Nearly one third the population are of foreign birth, chiefly French Canadians and Poles. Pop. (1890) 7,329; (1900) 8,263. Consult Gay, 'Gazetteer of Hampshire County.'

R. E. CAPRON,
Editor 'Ware River News.'

WAREHAM — WARFIELD

Wareham, wār'am, Mass., town in Plymouth County; on Buzzard's Bay, and on the New York, New Haven & Hartford Railroad; about 50 miles southeast of Boston and 15 miles northeast of New Bedford. It has steamer connections with many of the coast cities and towns. The town contains the villages of Wareham, East Wareham, West Wareham, South Wareham, and Onset. The chief industries are iron manufacturing, and the cultivation of cranberries. The town has five churches, one high school, elementary schools public and private, and a public library. There are two banks, one national, capitalized for \$100,000, and a savings bank with deposits amounting to \$878,470. Pop. (1890) 3,451; (1900) 3,432.

Warehouseman, in law, one who receives goods of any kind for the mere purpose of storage. He is a bailee, and, his contract with the owner being one for their mutual benefit, is held only to ordinary care and diligence; and if loss or injury happen to the goods, he is not responsible without the absence of this care or diligence on his part, unless he expressly assumes a greater responsibility. There is nothing, however, to prevent warehousemen receiving goods on whatever terms or contract they see fit to make with the owner. Persons may become warehousemen, and subject only to the law of that relation, whose general position is quite different. Forwarding merchants in the United States are generally regarded as warehousemen, unless they take upon themselves the duty and the responsibility of common carriers, which they do when they begin to act in that character. On the other hand, common carriers, as railroad companies or expressmen, lie only under the less responsibility of warehousemen when they cease to be carriers of the goods they have transported, or have not yet begun to carry those they have taken for future transport. It is sometimes difficult to draw the line in particular cases, and say whether a person or company is liable without fault because the goods were then in his or its possession as carrier, or liable only for fault because the transit had not begun, or had terminated. The general principle is quite certain, although the authorities are far from uniform in their application of it. If the carrier receives them to carry at once or as soon as he can, he holds them as carrier; if he is to keep them until a distant period of transit, until then he is only a warehouseman. If the actual transit have ceased, some courts hold that his liability ceases at once; and it undoubtedly does so when, after he is ready to deliver them, they are left on his hands and he awaits the call of the owner or consignee. A warehouseman has a lien on goods in his care for the storage of them. He may deliver a part and retain his lien on the residue for all his charge for all the goods, if all were delivered to him as one bailment. But he has no general lien on any goods for all demands against the owner, or for the storage of other goods.

Warehousing System, the system by which goods liable to excise or customs duty are kept in warehouses without the duty being paid on them till they pass to the consumer or the retail dealer. Goods liable to duty are warehoused in a bonded warehouse, and are called goods in bond. The ports at which par-

ticular kinds of goods may be warehoused are determined; but the system has been gradually relaxed so as to admit of every important port being used for warehousing, and even important inland towns are admitted as warehousing centres. The warehouse is kept by a bonded store-keeper, who gives a bond of sufficient value, and with satisfactory security to the government for the performance of his duties. When goods are warehoused by an importer in a bonded store they may be transferred by an order, addressed by the importer to the store-keeper, to any other person, the new owner assuming the responsibilities of the importer. Goods in a bonded store are always open to the inspection of the officers of customs, and can only be inspected by the owner in the presence of the proper officer. Any importer who fraudulently gains access to goods stored by him without the presence of the proper officer is liable to a penalty of \$500. Goods must be stored and remain in store in their original packages, unless when permission is given before or after storing to sort or repack them. Any infringement of this regulation, or of the regulations for storing or removing goods, subjects to heavy penalties, commonly to the forfeiture of the goods. Goods under bond may on application be removed at the expense of the owner as often as required from one warehouse to another, or by coast, or inland carriage, from one port to another, being stored on the same terms in the new port or warehouse as in the old. The warehouse-keeper is bound to store the goods so that easy access can be had to each package. The keeper of the warehouse is liable for the duty on any goods taken out of the warehouse without proper authority; but if goods are improperly removed by a customs-officer no duty is exigible. Goods which have been in warehouse for five years must be re-warehoused, or they will be liable to be sold.

Warfield, wār'fēld, **Benjamin Breckenridge**, American educator: b. Lexington, Ky., 5 Nov. 1851. He was graduated from Princeton in 1871, from the Princeton Theological Seminary in 1876, and studied at the University of Leipzig in 1877. The next year he became instructor in New Testament literature and exegesis at the Western Theological Seminary, Allegheny, Pa. He was appointed professor of those branches in 1879, and in 1887 he resigned to accept the chair of didactic and polemical theology at Princeton, which he still occupies. He edited the 'Presbyterian and Reformed Review' in 1890-1902, and has written: 'The Divine Origin of the Bible' (1882); 'Augustine's Anti-Pelagian Treatise' (1887); 'The Right of Systematic Theology' (1897); 'Acts and Pastoral Epistles' (1902); 'The Power of God, Unto Salvation' (1903); etc. He is prominent as a conservative leader in his denomination.

Warfield, **Ethelbert Dudley**, American college president, brother of B. B. Warfield (q.v.): b. Lexington, Ky., 16 March 1861. He was graduated from Princeton in 1882 and from the Columbia Law School in 1885. In 1886-8 he was engaged in law practice at Lexington, but in 1888 accepted the chair of history and the presidency of Miami University, Oxford, Ohio, resigning in 1891 to accept a like position at Lafayette College, Easton, Pa., where he

WARHAM — WARM-BLOODED ANIMALS

still remains. He was ordained to the Presbyterian ministry in 1809 and has published: 'The Kentucky Resolutions of 1798' (1887); 'At the Evening Hour' (1898); 'Memoir of Joseph Cabell Breckenridge, U. S. N.' (1898); etc.

Warham, wâr'am, **William**, English prelate, archbishop of Canterbury: b. Hampshire about 1450; d. 22 Aug. 1532. He was educated at New College, Oxford, of which he became a fellow in 1475. He acted for a time as advocate in the Court of Arches and moderator of the civil law school at Oxford, and in 1493 was ordained subdeacon. He was granted the living of Barley, Herts, in 1495, and that of Cottenham, near Cambridge, in 1500, and held both till 1502, when he was consecrated bishop of London. He was formally installed as archbishop of Canterbury in 1504, and about the same time he was appointed lord-chancellor after 17 months' service as keeper of the great seal. From 1506 till his death he was chancellor of Oxford University. He performed the ceremony of coronation in 1509, after the accession of Henry VIII., and in 1515 was succeeded by Wolsey in the lord-chancellorship. When Wolsey had been raised to the dignity of papal legate there was much friction between him and Warham in their official capacities. Warham's action in regard to the divorce question was weak and subservient, but shortly before his death he made a protest against the acts of the parliament undermining the papal authority. In his earlier years he was much employed on foreign embassies. Consult: Campbell, 'Lives of the Lord-Chancellors' (1845-6); Hook, 'Lives of the Archbishops of Canterbury,' new series, Vol. I. (1868).

Waring, wâr'ing, **George Edwin**, American sanitary engineer: b. Poundridge, N. Y., 4 July 1833; d. New York 29 Oct. 1898. He was a pupil in agriculture of James J. Mapes, in 1853-5 lectured in Vermont and Maine on improved farming methods, and in 1855 was made by Horace Greeley manager of the latter's well-known experimental farm at Chappaqua, N. Y. In 1857-61 he was agricultural and drainage engineer of Central Park, New York, whose drainage system he planned. Having entered the Federal army in 1861 as major of the 39th New York volunteers (Garibaldi Hussars), he fought at the first Bull Run, was transferred to the Department of the Southwest, recruited a battalion of cavalry (Frémont Hussars) at St. Louis, and when these were consolidated with other troops to form the 4th Missouri cavalry, he was made colonel of that regiment. He served as such until mustered out of the service in 1865. In 1867-77 he was manager of the Ogden Farm, Newport, R. I., writing during that time the 'Ogden Farm Papers' for the 'American Agriculturist.' At the time of the yellow-fever epidemic in Memphis, Tenn., in 1878, he was appointed to alter the drainage system there; and subsequently he devoted himself to sanitary engineering. In 1882 he was appointed a member of the National Board of Health, with which he remained connected for several years; and in 1894 he became assistant-engineer of New Orleans. From 1895 to 1898 he was street-cleaning commissioner of New York; during his administration he thoroughly reorganized his department and brought it to a high state of efficiency. In 1898 he was

selected to be head of a commission for the improvement of sanitary conditions in Havana, Cuba, with the purpose of eradicating yellow fever. He prepared a detailed report of great value, but died of the fever not long after his return to the United States. He was a member of the Institution of Civil Engineers, Great Britain, fellow of the Sanitary Institute of Great Britain, honorary member of the Royal Institute of Engineers, Holland, and corresponding member of the American Institute of Architects. Among his published works are: 'The Elements of Agriculture' (1854); 'Whip and Spur' (1875); 'A Farmer's Vacation' (1876); 'Village Improvements and Farm Villages' (1877); 'Sewerage and Land Drainage' (1889); and 'Modern Methods of Sewage Disposal' (1894).

Wark, David, Canadian legislator: b. near Londonderry, Ireland, 19 Feb. 1804. In 1825 he emigrated to New Brunswick, and there he took up shipbuilding, bookkeeping, and teaching until 1836, he turned to mercantile life at Richibucto, later adding to his interests milling and lumber-trade, and managing a large model farm near Kingston. He held office as a county magistrate and judge of the court of common pleas, in 1842 was elected from the county (Kent) to the provincial legislature, and in 1846 re-elected. From 1851 to 1867 he was a representative of the county in the legislative council, being in 1858-62 in the executive council, and for a time holding the post of receiver-general. In 1867 he was one of the original senators appointed to the Senate of Canada under the British North America act. Throughout his political career he was identified with the Liberal party. In the development of agriculture, the extension of trade, and the promotion of education, he was prominently concerned. He undertook in 1847 the furtherance of legislation favoring reciprocal trade between the provinces, and such legislation eventually proved of influence in connection with the reciprocity treaty of 1854 between Canada and the United States. The perfected system of the New Brunswick savings bank was largely due to his initiative; and he was chiefly instrumental in bringing about the movement which in 1847 resulted in the constitution of the provincial board of education of New Brunswick, with the attendant changes, and in the reorganization of King's College as the University of New Brunswick (1859). His centenary was formally observed in 1904 by the presentation of addresses, it being claimed for him that he was the world's oldest legislator; and on 28 April a portrait of him by W. Forbes, A.R.C.A., was unveiled in the Senate. Consult an article by Crockett in the 'Westminster Magazine' (Toronto) for June 1903.

Warkamoo'wee, in Ceylon, the name of a canoe used with outriggers. It is generally manned by four or five Lascars, who sit grouped together for hours at the end of the lever, adding or taking away a man according to the strength of the wind. These canoes often sail 10 miles an hour.

Warm-blooded Animals, the name given to mammals and birds, in contradistinction to fishes, amphibians, and reptiles, and to all invertebrate animals. See **ANIMAL HEAT**.

WARMAN—WARNER

War'man, Cy, American journalist: b. Greenup, Ill., 22 June 1855. He engaged as a farmer and wheat broker in Illinois until 1880 when he removed to Colorado. He became editor of the 'Western Railway,' Denver, Colo., in 1888; of the *Creede, Colo., 'Chronicle'* in 1892; and in 1892 was introduced to the public as the "Poet of the Rockies" by the *New York Sun*. He went to New York in 1893 and has since been engaged in literary work. He wrote the words of the popular song 'Sweet Marie' and has published: 'Tales of an Engineer' (1895); 'Snow on the Headlight' (1899); 'Short Rails' (1900); a volume of verse; etc.

Warming and Ventilation. See HEATING AND VENTILATION.

War'moth, Henry Clay, American politician and soldier: b. McLeansboro, Ill., 9 May 1842. He was admitted to the bar in 1861 and became district attorney of the 18th judicial district of Missouri in 1862, but resigned to enter the Union army. He was appointed lieutenant-colonel, was engaged in the assaults on Vicksburg of 19-22 May 1862, and was present at the battles of Lookout Mountain and Missionary Ridge. He served in the Texan campaign and was afterward judge of the military court of the Department of the Gulf until the close of the war. He became military governor of Louisiana in 1868 and was inaugurated civil governor upon the adoption of its new constitution, an office he occupied until 1873. He was a member of the Louisiana legislature in 1876-7 and collector of customs at New Orleans in 1889-93. He was one of the builders of the New Orleans, Fort Jackson & Grand Isle Railroad, of which he is president.

Warner, wâr'nér, Anna Bartlett ("AMY LOTHROP"), American novelist, sister of Susan Warner (q.v.): b. New York 1820. She collaborated with her sister in writing the novels: 'Say and Seal' (1860); 'Wych Hazel' (1876); and 'The Gold of Chickaree' (1876). Her own publications include: 'Dollars and Cents' (2 vols., 1853); 'My Brother's Keeper' (1855); 'Stories of Vinegar Hill' (1871); 'The Fourth Watch' (1874); 'The Light of the Morning' (1882); 'Cross Corners' (1887); etc.

Warner, Beverley Ellison, American Protestant Episcopal clergyman: b. Jersey City, N. J., 14 Oct. 1855. He was educated at Princeton and Trinity colleges and at Berkeley Divinity School, Middletown, Conn., took orders in 1879, and is now rector of Trinity Church, New Orleans, La. He is author of 'Troubled Waters,' a novel (1885); and has also written: 'English History in Shakespeare's Plays' (1894); 'The Young Man in Modern Life' (1902); etc.

Warner, Charles Dudley, American editor and author: b. Plainfield, Hampshire County, Mass., 12 Sept. 1829; d. Hartford, Conn., 20 Oct. 1900. Graduated from Hamilton College in 1851 and from the law school of the University of Pennsylvania in 1856, he was admitted to the bar in the latter year at Philadelphia, and practised his profession at Chicago in 1856-60. In 1860 he became assistant editor of the *Hartford (Conn.) Evening Press*, and in 1861 its editor-in-chief. This newspaper was consolidated in 1867 with the *Courant*, a morning journal, and Warner was a part-owner and long

assistant editor of the latter, though eventually his connection with the paper was largely that of a literary contributor. Some letters of travel in America and Europe in 1868-9, printed in the *Courant*, were widely copied, and his articles published in book-form in 1870 as 'My Summer in a Garden,' placed him high in the list of American humorists. From 1884 to 1892 he was in charge of the 'Editor's Drawer' department of 'Harper's Magazine,' and in 1892 was transferred to that of the 'Editor's Study' in the same magazine. He was particularly successful in the essay, in which he combined shrewd observation and cultured humor in a manner in many ways resembling that of Washington Irving. He was a discerning critic as well; and in addition to his literary activities was identified with various philanthropic work. His further publications include: 'A Book of Eloquence' (1853); 'Saunterings' (1872); 'Backlog Studies' (1872); 'The Gilded Age' (with S. L. Clemens, 1873); 'Baddeck, and That Sort of Thing' (1874); 'Mummies and Moslems' (1876—reissued as 'My Winter on the Nile'); 'In the Levant' (1877); 'Being a Boy' (1877); 'In the Wilderness' (1878); 'The American Newspaper' (1879); 'Studies of Irving' (with W. C. Bryant and George P. Putnam, 1880); 'Life of Washington Irving' (1881); 'Captain John Smith, Sometime Governor of Virginia, and Admiral of New England: A Study of His Life and Writings' (1881); 'A Roundabout Journey' (1883); 'Papers on Penology' (with others, 1886); 'Their Pilgrimage' (1886); 'On Horseback: A Tour in Virginia, North Carolina, and Tennessee, Published with Notes of Travel in Mexico and California' (1888); 'Studies in the South and West, with Comments on Canada' (1889); 'A Little Journey in the World: A Novel' (1889); 'Looking Forward: The Dual Government Realized' (1890); 'Our Italy, Southern California' (1890); 'As We Were Saying' (1891); 'Washington Irving' (1892); 'The Work of Washington Irving' (1893); 'As We Go' (1893); 'The Golden House: A Novel' (1894); 'The Relation of Literature to Life' (1896); 'The People for Whom Shakespeare Wrote' (1897). He also edited the 'American Men of Letters' series and 'A Library of the World's Best Literature' (1896-8).

Warner, Olin Levi, American sculptor: b. Suffield, Conn., 9 April 1844; d. New York 14 Aug. 1896. He studied in the *Ecole des Beaux Arts* in Paris and subsequently entered Carpeaux's studio. In 1872 he opened a studio in New York, where his work came under the eye of several critics whose commendation secured his success. In 1877-8 he modeled 'Twilight,' which established his reputation. Among other well known works of his may be mentioned 'The Dancing Nymph'; 'Cupid and Psyche'; reliefs of Joseph and other Indian chiefs; statues of Governor Buckingham of Connecticut, William Lloyd Garrison, General Devens, etc.

Warner, Seth, American soldier: b. Roxbury, Conn., 17 May 1743; d. there 26 Dec. 1784. Having removed in 1763 to Bennington, he was prominent in the dispute between New York and the "New Hampshire Grants" (afterward Vermont), and was outlawed (1771) with Ethan Allen (q.v.) and others. He took part

in the capture of Ticonderoga, and 12 May 1775 effected the surrender of Crown Point with its garrison and 113 cannon. On 16 Sept. 1775 he was made by Montgomery, in whose Canadian expedition he participated, colonel of a regiment of Green Mountain rangers, though the provincial congress of New York withheld his commission. On 5 July 1776 he was commissioned by Congress the colonel of a regiment formed in pursuance of a resolution passed on that day; and on 7 July 1777 was defeated by Fraser at the battle of Hubbardton (q.v.). At the battle of Bennington, 16 Aug. 1777, he arrived with his regiment in time to meet the enemy's reinforcement and secure a victory. In 1782 he withdrew from the service. Consult Chipman, 'The Life of Col. Seth Warner, with an Account of the Controversy between New York and Vermont from 1763 to 1775' (1858).

Warner, Susan, American author: b. New York 11 July 1819; d. Highland Falls, Orange County, N. Y., 17 March 1885. For a number of years she resided on Constitution Island in the Hudson River, opposite West Point. Her first essay in literature was a novel entitled 'The Wide, Wide World,' published in 1850 under the pseudonym of Elizabeth Wetherell. This book was in its day next to 'Uncle Tom's Cabin' the most successful work of fiction in America in point of sales, and was popular also in Europe. In cheaper editions it still finds readers. It was mediocre in style and unduly pietistic in its manner; and, says Richardson, "all literature cannot show so lachrymose a book." It was succeeded by 'Queechy' (1852), which had also a large circulation, and 'The Hills of the Shatemuc' (1856), containing many glimpses of American scenery. She was also the author of 'The Law and the Testimony' (1853), in which the texts proving the great doctrines of Christianity are brought together under their appropriate heads; 'The Old Helmet' (1863); 'Melbourne House' (1864), and other works.

Warning Coloration, in zoology. See COLORATION, PROTECTIVE.

Warō'ra, or **Wurora**, India, a town in the district of Chanda, Central Provinces, on the left bank of the Wardha River, 40 miles south-east of Wardha. Here is one of the largest coal fields in the peninsula. A shaft passes through a coal seam 15½ feet thick at a depth of 176 feet, and a little lower through another seam 11 feet thick. The field is estimated to afford an output of 100,000 tons per annum for 100 years. A narrow gauge line connects Warora with Wardha station on the Great Indian Peninsula Railway.

Warp. See WEAVING.

Warping, in agriculture, a mode of fertilizing poor or barren land by means of artificial inundation from rivers which hold large quantities of earthy matter, or warp, in suspension. The operation, which consists in enclosing a body or sheet of water till the warp has deposited, can only be carried out on flat low-lying tracts which may be readily submerged.

Warrant, as a legal term, is used to denote various judicial writings which authorize officers of the court to act in aid of justice such as to make arrests, search or seizures, and has been defined as "an order in writing in the name

of the people signed by a magistrate commanding the arrest of the defendant." The power is conferred upon justices of the peace, judges, of certain courts, and corporation officers who are clothed with powers of justice of the peace. The warrant is addressed to a sheriff, constable, or other officer, commanding him to arrest the body of the person named and bring him before the magistrate or court to answer or be examined regarding some offense which he is charged with having committed; it is not issued without probable cause, and is secured on the complaint of a person who thinks that a public offense has been committed and who appears before the justice of the peace and requests that a warrant be issued. A warrant must give the name of the accused or sufficient data to establish his identity. It must state the offense in respect to which the magistrate has authority to issue the warrant. A return must be made by the officer of his doing under it, but as there is no set time for a return, a warrant remains in force until it is executed. There are various other forms of warrant, such as search warrant of commitment, death warrant, extradition warrant, dividend or interest warrant, land warrant, landlord's warrant, tax warrant, warrant in bankruptcy, and municipal warrants.

Warrant Officer, a rank in the navy divided into three classes—gunners, boatswains, and carpenters, the gunners taking precedence of the other two. Formerly, before ironclads superseded wooden ships, there was only one officer of this rank of each class carried on board even the largest ships. Now, in addition to the officer of each class appointed to carry out the special duties of gunner, boatswain, and carpenter on board every ship, there are usually three or four junior gunners or boatswains appointed to battleships and some of the larger of other classes of ships to perform what are called quarter-deck duties, in addition to which in many of the larger ships an extra gunner or boatswain is appointed for torpedo duties. See NAVY OF THE UNITED STATES.

War'ranty, as a legal term is used as a promise or covenant or an undertaking on the part of one person to answer for the statements made of the thing warranted to be as represented, and to indemnify against loss, in case of failure. There are two general classes, express and implied. An express warranty is one made expressly in given terms, such as, in insurance, to indicate that an undertaking on the part of the insured that certain alleged facts are as he represents them to be; in real estate, that the grantor has a legal title to the lands conveyed; in sales, that the seller assures the quality, or the title to the property sold. A warranty in a sale of personal property is a statement made at the time of, and as part of the sale, that the goods or article sold is as represented. A warranty is implied when the law derives it by implication or inference from the nature of the transaction. No particular form of words is necessary to create a warranty. It is the subject matter of a statement and the circumstances under which it is made that are considered rather than the form.

A warranty is not valid unless supported by a consideration. In case of a breach of warranty the vendee may sue for the purchase price

WARREN

or may claim damages, and is not bound to return the goods. Proof of a warranty in a written contract must be shown in writing. Oral warranty cannot be admitted as evidence to vary the terms of a written contract except where the warranty is an independent agreement and where the writing does not embrace the whole contract.

Warren, wōr'ēn, Sir Charles, British general: b. Bangor 7 Feb. 1840. He received a military education at Sandhurst and Woolwich, joined the Royal Engineers in 1857, and in 1861-5 was engaged in a survey of Gibraltar. During the three years following 1867 he carried out exploring work in Palestine for the Palestine Exploration Fund, and in 1876 was a commissioner for settling the western boundary of the Orange Free State. He commanded the Diamond Fields Horse in the Kaffir war of 1878, and during the immediately succeeding Griqua and Bechuana campaigns was commander of the field force. He returned to England in 1880, and during the next four years was attached to the Chatham school of military engineering as instructor in surveying. He commanded the Bechuanaland expedition of 1884-5, and was in command at Suakim. From 1886 till his resignation in 1888 he was chief commissioner of the metropolitan police of London, and for five years from 1889 was in command of the troops in the Straits Settlements, with the temporary rank of major-general. He was commander of the Thames district 1895-8; commanded a division in the South African war of 1899-1902, and co-operated with Sir Redvers Buller in that attempt to relieve Ladysmith with which the occupation of Spion Kop is prominently associated. He was afterward appointed military governor of Griqualand West. He has published 'Underground Jerusalem' (1876); 'The Temple or the Tomb' (1880); and, with C. R. Conder, 'Jerusalem' (1884).

Warren, Francis Emroy, American legislator: b. Hinsdale, Mass., 20 June 1844. He served in the Civil War as a non-commissioned officer in 1862-5 and received a Congressional medal for gallant conduct at Fort Hudson. He removed to Wyoming in 1868, became active in politics, was a member and president of the council, mayor of Cheyenne, treasurer of the Territory, and in 1885-6 was governor. In 1889 he again became governor and upon Wyoming's admission to statehood in 1890 was elected first governor of the State; before the expiration of his term, however, he was elected to the United States Senate, of which body he is still a member.

Warren, Frederick Morris, American philologist: b. Durham, Maine, 9 July 1859. He was graduated from Amherst in 1880 and engaged as instructor in modern languages at Johns Hopkins in 1886-91. In 1891-1901 he was professor of Romance languages at the Western Reserve University, and since 1901 has been professor of modern languages at Yale. He has published: 'A Primer of French Literature' (1889); 'History of the Novel Previous to the Seventeenth Century' (1895), etc.; and has also edited: 'Selections from Victor Hugo' (1893); 'French Prose of the Seventeenth Century' (1899); Lamartine's 'Graziella' (1900); and 'Racine' (1903); etc.

Warren, Gouverneur Kemble, American military officer: b. Cold Spring, N. Y., 8 Jan. 1830; d. Newport, R. I., 8 Aug. 1882. He was graduated from West Point in 1850, was assigned to the engineering corps, and until 1859 was engaged in making river and railway surveys between the Mississippi River and the Pacific Ocean. He was assistant professor of mathematics at West Point from 1859-61, when he became lieutenant-colonel and later colonel and captain of volunteers. For service at Gaines' Mills in 1862 he was promoted brigadier-general, and he became chief of topographical engineers in 1863, rising to chief of engineers in the Army of the Potomac in that year. He was on the staff of Gen. Meade at the battle of Gettysburg, where on 2 July he seized and held Little Round Top, the key to the Federal position. He was promoted major-general of volunteers in May 1863 and in 1864 assumed command of the Fifth corps in the Army of the Potomac. He was subsequently placed in command of the Department of the Mississippi and in 1865 was mustered out of the volunteer service as brevet brigadier-general of regulars. He continued in the army, engaged in various surveys, and in 1879 was promoted lieutenant-colonel. A statue was unveiled to his memory on Little Round Top, Gettysburg, 8 Aug. 1888. He published various reports and 'An Account of the 5th Army Corps at Five Forks' (1866).

Warren, Henry Kimball, American college president: b. Cresco, Iowa, 31 May 1858. He was graduated from Olivet College in 1882, was principal of the public schools of Mount Pleasant, Mich., 1882-3, and of those at Hannibal, Mo., 1883-9. He was president of Gates College, Nebraska, 1889-94, of Salt Lake College, Utah, 1894-5, and has been president of Yankton College, South Dakota, from 1895.

Warren, Henry White, American Methodist bishop: b. Williamsburg, Mass., 4 Jan. 1831. He was graduated from Wesleyan University in 1853 and in 1855 was admitted into the Methodist Conference. He was engaged for 15 years in various pastorates in Massachusetts; served in the Massachusetts house of representatives in 1861-2; was pastor of the Arch Street Church in Philadelphia in 1871-4, and in 1877-80; and in 1880 was elected bishop. He has traveled in almost all parts of the United States in the performance of his episcopal duties and visited Japan for inspecting the Methodist Church missions in 1888. He edited 'The Study' in 1896-1900, and has published: 'Sights and Insights' (1874); 'Recreations in Astronomy' (1879); 'The Bible in the World's Education' (1892); 'Among the Forces' (1898); etc.

Warren, James, American Revolutionary leader: b. Plymouth, Mass., 28 Sept. 1726; d. there 27 Nov. 1808. He was graduated at Harvard in 1745, and for several years was engaged in mercantile pursuits at Plymouth. He was elected a member of the general court from Plymouth in 1766, was uniform in his support of the rights of the colonies, and remained in that assembly until it was dissolved in 1774. In 1772 he took a leading part in the establishment of committees of correspondence for the different colonies, a measure generally adopted. He became president of the Massa-

WARREN

chusetts provincial congress in 1775, was paymaster to the Continental army while it was at Cambridge, after the adoption of the Massachusetts State constitution was for several years speaker of the House, and held also a seat in the navy board.

Warren, Sir John Borlase, English naval officer: b. Stapleford, Nottinghamshire, 1754; d. Greenwich 27 Feb. 1822. He entered the navy as midshipman and after serving in that capacity for some time studied at Emanuel College, Cambridge, and took his degree in 1776. In 1774 he entered parliament as member for Marlow, and in 1775 was created a baronet. In 1793, on the commencement of the war with France, he was appointed to the *Flora* frigate, and in 1795 commanded the expedition to Quiberon Bay to assist the insurrectionists of *La Vendée*, which was unsuccessful. On 11 Oct. 1798 he fell in with a French squadron off the coast of Ireland destined for the invasion of that country, and captured the *Hoche* line-of-battle ship and three frigates. For this he was subsequently made rear-admiral of the blue. He continued in the navy until the peace of Amiens, when he was made privy councillor and sent to Russia as ambassador extraordinary and minister plenipotentiary, and there managed some delicate negotiations with regard to the retention of Malta with great ability. On his return he again entered into service, subsequently became vice-admiral, and in 1812 received the chief command in North America and the West Indies. He is the supposed author of an anonymous work entitled '*A View of the Naval Force of Great Britain*' (8 vols., 1791).

Warren, John Byrne Leicester, 3D BARON DE TABLEY, English poet: b. Tabley House, Cheshire, 26 April 1835; d. Ryde, Isle of Wight, 22 Nov. 1895. He was educated at Eton and Oxford, was called to the bar, and after a short diplomatic experience, devoted himself to literature. His life was passed in retirement, although he was the personal friend of Tennyson, Browning, Gladstone, and other eminent men of his day. His poetry, which reveals many excellencies of style as well as depth of thought, appeals to the cultivated few, but not to the general public. His earliest work appeared with the signature "G. F. Preston" (1858-62), and later he used the pseudonym "William Lancaster." After 1873 his work appeared with his own name, John Leicester Warren. In 1893 he published '*Poems Dramatic and Lyrical by Lord De Tabley*,' which met with qualified success, and in 1895 a second series appeared. Among his other volumes of verse are '*Præterita*' (1870); '*Philoctetes*' (1867); '*Orestes*' (1868); '*Rehearsals*' (1870); and '*Searching the Net*' (1873). He also wrote two novels, '*A Screw Loose*' (1868); '*Ropes of Sand*' (1869).

Warren, Joseph, American patriot: b. Roxbury, Mass., 11 June 1741; d. Charlestown, Mass., 17 June 1775. He was graduated from Harvard in 1759, studied medicine with Dr. James Lloyd of Boston, entered the practice of his profession in 1764, and from the time of the Stamp Act (q.v.) (1765) contributed to the press. On the occasion of the Townshend revenue acts (see TOWNSHEND, CHARLES, 1725-67), imposing duties on paper, glass, painter's colors,

and tea, legalizing writs of assistance, and forming a board of customs, Warren printed in the Boston 'Gazette' over the signature "A True Patriot," a letter which caused Governor Francis Bernard to attempt the prosecution of the publishers on the ground that the article tended to bring the royal government into contempt. The attorney-general began proceedings, but the grand-jury refused to find a bill. In 1770 Warren was one of the committee of safety appointed after the "Boston massacre" of 5 March, and in 1772 he pronounced the memorial oration at the anniversary of that event. With Samuel Adams (q.v.) and James Otis (q.v.) he was recorded in November 1772 as a member of the first committee of correspondence, and during the next two years busily co-operated with Adams. When the latter left Boston, 10 Aug. 1774, to attend the meeting of the Continental Congress at Philadelphia, Warren became the leading figure in Massachusetts political movements. When the towns of Suffolk County assembled in convention at Milton, 9 Sept. 1774, Warren read a set of resolutions, drawn up by himself and since known as the "Suffolk resolves," which declared that a king who has violated the chartered rights of subjects forfeits their allegiance; that the "Regulating act," which had deprived Massachusetts without a previous notice and without a hearing of most important rights and liberties, was null and void; and directed tax-collectors to refuse to pay the moneys collected to Gates' treasurer, warned Gates that if patriots were arrested for political reasons royal officers would be held as hostages, and counseled the towns to choose their own officers of militia. After the meeting of the Provincial Congress in October 1774, Warren was chairman of the committee of safety for collecting military stores and organizing a militia, and on 5 March 1775 delivered his second oration on the anniversary of the "massacre." He was unanimously elected president of the Provincial Congress at its Watertown meeting, 31 May, being thus made chief executive under the provisional government. On 14 June he was chosen second major-general of Massachusetts forces, and on 17 June went to Bunker (Breed's) Hill, where he told Putnam and Prescott that he had come to serve as a volunteer aide. At the final conflict near Prescott's redoubt he was shot and killed. Webster's apostrophe to him in the 'Bunker Hill Oration' as "the first great martyr in this great cause" is well known. The biography by Everett in Sparks' '*American Biography*,' Vol. X. (1838) has been superseded by that of Frothingham, '*Life and Times of Joseph Warren*' (1865).

Warren, Mercy Otis, American patriot: b. Barnstable, Mass., 25 Sept. 1728; d. Plymouth, Mass., 19 Oct. 1814. She was Mrs. James Warren (see WARREN, JAMES), and James Otis (q.v.) was a brother. An ardent patriot, she corresponded with the leaders of the Revolution, among them Samuel and John Adams, and Thomas Jefferson. She wrote some dramatic works which were included in her volume of '*Poems, Dramatic and Miscellaneous*' (1790). Of these attempts in drama the best is the metrical 'Group,' satirizing British and Tory leaders. The chief of her writings, however, is the three-volume '*History of the Rise, Progress, and Termination of the*

WARREN

American Revolution, Interspersed with Biographical, Political, and Moral Observations' (1805). Tyler admits the "tone of undisguised partisanship ringing through the book," but calls it a "powerful delineation of a great period," and says its character-sketches may still be found of interest.

Warren, Richard Henry, American musician: b. Albany, N. Y., 17 Sept. 1859. He studied under his father and others in this country, and then (1880 and 1886) in Europe. In 1877-9 he was organist and director of music at the church of Saint John the Evangelist, New York, and in the same city has held similar positions at the Reformed Episcopal Church (1879-80), All Souls' (Author Memorial) Church (1880-6), and Saint Bartholomew's Church (since 1886). In 1889-96 and again in 1904 he was conductor of the Church Choral Society, during the same time conducting other organizations. Besides many church anthems and services, songs, etc., his compositions include 'Igala' (1880); 'All on a Summer's Day' (1882), and 'Magnolia' (1896), operettas; 'Phyllis' (1897), a romantic opera, produced at the Waldorf-Astoria Theatre 7-21 May 1900; 'Ticonderoga,' a string quartette; and a cantata.

Warren, Samuel, English novelist: b. Denbighshire, Wales, 23 May 1807; d. London 29 July 1877. He studied medicine at Edinburgh and law at the Inner Temple, was called to the bar in 1837, and was made queen's counsel in 1851. He was recorder of Hull (1854-74), represented Midhurst in Parliament (1856-9), and was appointed master in lunacy in 1859. His earliest work, 'Passages from the Diary of a Late Physician' (1832), appeared in several editions in both England and the United States, but his most popular work was 'Ten Thousand a Year' (1841), which has passed through many editions. It appeared in an abridged form in 1903. He published various other works, including 'Now and Then' (1847); 'The Lily and the Bee' (1851); and several law books.

Warren, William Fairfield, American educator: b. Williamsburg, Mass., 13 March 1833. He was graduated from Wesleyan University in 1853, ordained in the Methodist ministry in 1855, and for several years was professor of systematic theology at the Mission Institute, Bremen (now Martin Institute, Frankfurt) Germany. In 1866 he became acting president of the Boston Theological Seminary, and from 1873-1903 he was president of Boston University, occupying, also, during that time, the chair of philosophy of religion and comparative theology. His writings include: 'The True Key to Ancient Cosmology' (1882); 'Paradise Found,' published also in Japanese, Chinese, Spanish, and German (1885); 'The Story of Gottlieb,' translated into German and Arabic (1890); 'Constitutional Law Questions in the Methodist Episcopal Church' (1894); 'The Religion of the World and the World's Religion' (1900); etc.

Warren, Ill., village in Jo Daviess County; on the Illinois C., and the Chicago, M. & St. P. R.R.'s; about 26 miles east by north of Galena and 25 miles northwest of Freeport. It is in an agricultural and stock-raising region, and near

the lead mines of the Galena district. A good quality of tobacco is grown in the vicinity. The chief industrial establishments are flour mills, creameries, and tobacco factories. The village has a high school, graded schools, a public library, and a state bank. Pop. (1890) 1,172; (1900) 1,327.

Warren, Ind., town in Huntington County; on the Salamonie River, and on the Toledo, Saint Louis & Kansas City Railroad; about 75 miles north by west of Indianapolis and 15 miles south of Huntington, the county-seat. It is in a region of good farm lands and in a natural-gas and petroleum belt. The chief manufacturing establishments are flour and lumber mills, cooperage, and machine shop. There are large shipments of hay, grain, and live stock. Pop. (1890) 1,120; (1900) 1,523.

Warren, Maine, town in Knox County; on Saint George's River, and on the Maine Central Railroad; 60 miles northeast of Portland. It was first permanently settled in 1736, though it was known as a trading post as early as 1631; it was incorporated as a town in 1776. There are large deposits of limestone in the town; and the river affords power for manufacturing; the town contains cotton and shoe factories, and a powder mill. There is a public high school. Pop. (1890) 2,037; (1900) 2,069.

Warren, Mass., town in Worcester County; on the Chicopee River, and on the Boston and Albany Railroad, 18 miles west of Worcester. It includes the villages of Warren and West Warren. It was first settled in 1731, and in 1741 was incorporated as a town under the name of Western. In 1834 the name was changed to Warren. It contains cheese factories, cotton and woolen mills and manufacturing of steam pumps and engines. It has a public high school established in 1870, and a public library of about 10,000 volumes (1904) founded in 1876 by a library association. Pop. (1890) 4,681; (1900) 4,417.

Warren, Ohio, city, county-seat of Trumbull County; on the Mahoning River, and on the Pennsylvania, the Erie, and the Pittsburgh & W. R.R.'s; about 50 miles southeast of Cleveland and 15 miles northwest of Youngstown. It is a region where much of the land is good for farming, but the chief industries of the city are connected with manufacturing iron products. Some of the principal manufactures are rolling mill products, flour, lumber products, automobiles, tubing, bath tubs, electric lamps, foundry and machine-shop products. In 1900 (government census) there were 110 manufacturing establishments, capitalized for \$2,952,697, and employing 2,081 persons to whom was paid annually the sum of \$997,455. The principal public buildings are the county court-house, the municipal buildings, churches, and schools. There are a high school, public graded schools, and a public library containing about 10,000 volumes. There are five banks, capitalized for \$500,000 and having deposits amounting to \$2,949,940. Warren was founded in 1799; incorporated in 1834. Pop. (1890) 5,973; (1900) 8,529.

Warren, Pa., borough, county-seat of Warren County; on the Allegheny River, and on the Pennsylvania, the Western N. Y. & P., and the Dunkirk, A. V. & P. R.R.'s; about 120 miles northeast of Pittsburgh and 20 miles south

WARREN — WARRNAMBOOL

of Chautauqua Lake, N. Y.; long 79° 15' W., lat. 41° 50' N. It is in an agricultural and oil region, but the chief industries are connected with oil products and manufacturing. The principal manufacturing establishments are iron works, lumber mills, oil and gas engine factories, boiler works, piano factories, and furniture factories. Other manufactures are wood alcohol, oil and the by-products, glue, barrels, machinery used with oil wells and for manufacturing. In 1900 (government census) there were 119 manufacturing establishments, capitalized for \$2,869,020, and employing 1,270 persons to whom was paid annually the sum of \$585,590. The raw material used cost \$2,357,681, and the value of the total annual products was \$4,152,859. The principal public institutions are the county court-house, the State Hospital for Insane, the churches and educational institutions. There are 15 churches representing seven different denominations. There are seven public schools, one R. C. parish school, four private schools, a public library containing about 12,000 volumes. The five banks (November 1903) had a combined capital of \$575,000 and deposits amounting to \$4,534,350. The government is administered according to the Pennsylvania statutes for boroughs, which provides for a burgess and a council of 14 members who hold office three years.

Warren was settled in 1795 by Daniel McQuay, and was incorporated in 1832. The village of Gade was annexed in 1895. There are a large number of foreign-born inhabitants, chiefly Germans and Scandinavians. Pop. (1890) 4,332; (1900) 8,043.

JAMES H. BERGER,

Secretary Board of Trade.

Warren, R. I., town in Bristol County, on the Warren River and Narragansett Bay, and on the New York, New Haven and Hartford railroad; 10 miles southeast of Providence. It was the old Indian town of Sowamset; a trading post was established there by white men as early as 1632, but permanent settlement was later. It was in the territory in dispute between Rhode Island and Massachusetts, and originally formed a part of the town of Swansea, Mass.; after the boundary was settled and Warren came under the jurisdiction of Rhode Island it was incorporated as a town (1747); in 1770 the town of Barrington was separated from it. From 1764-70 it was the seat of the College of Rhode Island (now Brown University). During the Revolutionary War the town was pillaged by the British, and a number of houses burned. It is now largely a manufacturing town, its manufactures including cotton goods, braid and twine. It has a public high school, and the George Hall Free Library. Pop. (1890) 4,489; (1900) 5,108. Consult Fessenden, 'History of Warren.'

Warren, (1) A tract of ground appropriated to the breeding and preservation of game or rabbits; also, a preserve for fish in a river.

(2) In English law, a franchise or place privileged by prescription or grant from the crown for keeping beasts and fowls of warren, which are hares, rabbits, partridges, and pheasants, though some add quails, woodcocks, and water fowl. The warren is the next franchise in degree to the park, and a forest, which is the highest in dignity, comprehends a chase, a park, and a free warren.

Warrensburg, wör'enz-bürg, Mo., city, county-seat of Johnson County; on the Black River, and on the Missouri Pacific Railroad; about 65 miles southeast of Kansas City. It is in a fertile agricultural region, and in the vicinity are large sandstone quarries. It has several mineral springs, noted for their medicinal properties. The springs and climate have much to do with making the city a favorite pleasure and health resort. The chief manufacturing establishments are flour mills, foundry and machine shops, wagon and carriage factories, and woolen mills. It has grain elevators, coal and stock yards. The city has the State Normal School for the Second District, a high school, and graded elementary schools. The three banks have (1903) a combined capital of \$100,000 and deposits amounting to \$837,440. Pop. (1890) 4,049; (1900) 4,724.

Warrenton, Va., town, county-seat of Fauquier County; on the Southern Railroad; about 50 miles southwest of Washington, D. C. It is in the region of the foot-hills of the Blue Ridge, and its picturesque scenery and cool climate in summer have made it a favorite summer resort. It has seven churches, a high school, Fauquier Institute, private select schools, a national bank and a private bank. The town has gravity waterworks. Pop. (1890) 1,346; (1900) 1,627.

Warrington, wör'ing-tón, England, a manufacturing town in Lancashire, on the river Mersey and the Manchester Ship Canal, near the Sankey and Bridgewater Canals, 15 miles east of Liverpool. The Latchford locks are notable features of the ship canal at Warrington. The public buildings and institutions include: the restored parish church of St. Elphin, in Decorated style; other modern parish churches; Nonconformist and Roman Catholic churches; the town-hall, in classical style; the museum, containing a free library and municipal art-gallery; the grammar school, blue-coat school, clergy orphan daughters' school, St. Elphin's schools, a training college for school mistresses, a municipal school of art, technical schools, and other educational institutions; post-office; public baths; new police premises; the market-hall; municipal gas works, waterworks, tramways, electric light works, and works for the treatment of night-soil; an infectious diseases and a smallpox hospital, and an infirmary; a gymnasium; a public cemetery; public parks and gardens; and military barracks. Of the numerous industries of the town the most important are the manufacture of iron and iron goods, wire, leather, soap, and beer. Warrington is an ancient town, and had at one time a house of Augustinian friars. The famous academy, which existed here from 1757 till 1783, had among its teachers Dr. Joseph Priestley, Dr. William Enfield, Dr. Aikin, Dr. John Taylor, the Rev. Gilbert Wakefield, and other eminent men; it is now represented by Manchester College, Oxford. Pop. (1901) 64,241.

Warrnambool, wâr'nam-bool, Australia, a seaport town in Victoria, on Warrnambool or Lady Bay, 166 miles southwest of Melbourne. The principal public buildings are the Episcopal, Roman Catholic, and other churches, various banking and insurance offices, mechanics' institute, the Odd Fellows' and the volunteer artillery halls, a hospital, and benevolent asylum,

WARS OF THE WORLD

etc. Steamers ply regularly several times a week to Melbourne, and a good trade is done from the port in wool and other agricultural produce. The town contains a flour mill, biscuit factories, boot factories, tanneries, breweries, etc. Pop. (1901) 6,410.

Wars of the World. The story of the wars of the world, if told in anything like its entirety, would be practically a history of the human race, for wherever nations have risen to greatness and have bred men capable of performing great deeds the records of these acts of heroism have almost invariably been made on those fields of battle upon which the supremacy of the nation itself has been accomplished. In the record of the wars of the world the student may read the tale of human progress—the story of the advance of civilization—for it cannot be denied that man's high place in the world to-day is largely a reward bestowed upon him in return for the brutality and bloodshed of the battlefields upon which his ancestors fought. That there have been wars that have been unnecessary is a fact that cannot be questioned, any more than one would deny that warfare has often been unnecessarily brutal, and yet, from a logical point of view, these are merely incidents which reflect upon but do not detract from the integrity of the original propositions: that war is the means by which superior nations have attained their superiority; that by war civilization was extended, and that in the winning process afforded by such international conflicts the fittest alone have survived and all that which was opposed to human progress or contrary to the best interests of civilization has been cast aside, to be lost and, eventually, forgotten by all save the historian who does not deign to record the most ignoble things in the life and customs of the earth's peoples.

Early History.—Unfortunately it is impossible to state, even approximately, when the first battle of the world was fought. In the early ages, of course, primitive man had all he could do to maintain a bare existence and preserve himself against the fury of the wild beasts so eager to attack him; but even tradition furnishes no clue to enable the student to discover at what period men first turned against other men to do battle with the crude instruments that had been devised only as a means of protecting themselves from the savage animals in the forests. All we know is that Osymandyas of Egypt, supposed by some to be the Osiris of the priests, is the first warlike king mentioned by history. He passed into Asia and conquered Bactria, about the year 2100 B.C. If Osymandyas was the first warlike king, however, he was not the last, for it has been estimated that since his time no less than 6,800,000,000 men have lost their lives on fields of battle; but, in spite of this gruesome record men have fought and will probably continue to conduct wars against each other, while all nations will be compelled to arm themselves with the latest fighting inventions, for, with the history of the past to guide them, they realize only too well that the Power that is not always prepared to protect its rights and properties with the sword may not unlikely find itself with very little except its honor to defend. Probably the first wars originated in nomad life and these conflicts were undoubtedly occasioned by the disputes which arose between the various

tribes in regard to their rights of possession in favorable pasturage. When all tribes devoted themselves to the flocks and herds there was little to discriminate between them, but, gradually, certain tribes began to assume different characteristics. One became attached to the art of agriculture; another devoted its time to hunting and fishing, while a third class still remained shepherds of the flocks. It was this difference of occupation which finally became the natural source of hostilities, for it established a series of classes, the stronger of which began to prey upon the weaker. Naturally, those who devoted themselves to the hunt became the victors in war, and, by reducing their victims to a condition of slavery, threw the manual labor, which they despised, upon the shoulders of others. In fact, there is a tradition in western Asia, that Nimrod, who is mentioned in the Bible as "a mighty hunter before the Lord," was the first person to engage upon an extensive system of warfare for the express purpose of obtaining slaves, and that it was he who introduced the practice of requiring conquered nations to pay an annual tribute, or, in other words, a ransom for their release. However true this may be we find that the ancient Old Testament days were full of such warfare, warfare in which the outcome was either tribute or slavery. History began on the banks of the Nile, and along the Tigris and the Euphrates; for these valleys, like two great oases, were practically the only habitable spots in the great desert. Fitted with all known conveniences for travel, with roads suitable for the passage of vast armies, these two centres of habitation finally became great rivals. In fact, whenever any particularly energetic ruler appeared in either spot he at once set out, as if moved by an irresistible impulse, to conquer his rival and so control western Asia. It may truthfully be said, therefore, that the history of this time is little more than one continuous record of struggles between Egypt and Mesopotamia, a condition which existed until Europe entered the lists and became the conqueror. In Egypt, during this age, the military class held such a prominent position in society that fully one third of the land was in the possession of the 410,000 men who composed the army.

As the Persians trusted for success mainly to numbers, war to them was little more than an exhibition of brute force. Sometimes as many as 1,000,000 men were brought into service for one campaign. In battle the troops were massed in deep ranks, those which were supposed to be the bravest being in front, but, if the line of battle was once broken, defeat appears to have been inevitable, for the army lost heart, even if the commander himself did not set the example of flight, and the general stampede that followed usually cleared the battlefield. Rawlinson's description of the appearance of the Persian forces in time of war is one of the most vivid word pictures painted by any historian:

The troops were drawn from the entire empire, and were marshalled in the field according to nations, each tribe accoutred in its own fashion. Here were seen the gilded breastplates and scarlet kilts of the Persians and Medes; there the woolen skirt of the Arab, the leathern jerkin of the Berber, or the cotton dress of the native of Hindustan. Swart savage Ethiopians from the Upper Nile, adorned with a war paint of white and red, and scantily clad with the skins of leopards and lions, fought in one place with huge clubs, arrows tipped with stone, and spears terminating in the horn

WARS OF THE WORLD

of an antelope. In another, Scythas, with their loose spangled trousers and their tall pointed caps, dealt death around from their unerring blows; while near them Assyrians, helmeted, and wearing corselets of quilted linen, wielded the tough spear or the still more formidable iron mace. Rude weapons, like cane bows, unfeathered arrows, and stakes hardened at one end in the fire, were seen side by side with keen swords and daggers of the best steel, the finished productions of the workshops of Phœnicia and Greece. Here the bronze helmet was surmounted with the ears and horns of an ox; there it was superseded by a fox-skin, a leathern or wooden skull cap, or a head dress fashioned out of a horse's scalp. Besides horses and mules, elephants, camels, and wild asses diversified the scene, and rendered it still more strange and wonderful.

Wars of the Romans.—Although the Persians fought and won battles in spite of their crude methods of fighting, Greece was the mother of the art of warfare. Of course, it must not be imagined, however, that the splendid body of perfectly trained soldiery comprising the armies of Athens, Sparta, Thebes, or Macedon was the product of a day, or of the genius of a single man, for nothing less than centuries were required for the perfection of this wonderful force. In the heroic days, the days of the Homeric battles, the Greek soldiers were no more to be commended than their Persian rivals. Loosely organized, poorly drilled, and badly equipped, the mass of the army was capable of doing little more than give the inspiration of numerical strength to the small bodies of heroes who did all the fighting. At length, however, the idea of the phalanx evolved itself, and, in a remarkably brief period of time, the history of the world was changed. At no time prior to the invention of the modern instruments of war has man conceived such a formidable weapon as the attack of a charging phalanx. It was this powerful engine of war that accomplished the downfall of the Persian force at Marathon. It was a still more perfect phalanx that resulted in the defeat of Thebes and the victory of Macedon on the fields of Chæronea. It was clearly the Greek phalanx—solid, erect and terrible in its effect—that enabled Alexander to inaugurate the campaign that had for its purpose the conquering of the entire known world. It was with the aid of the phalanx that Athens was preserved; that the Peloponnesian war was won by Sparta, and it was this same maneuver that saved the day for the Greek forces, until, at last, the Roman legions swept down upon a degenerate Macedon to declare the end of the Grecian empire. The story of Rome's supremacy is not dissimilar to that of the rise and fall of the Grecian power. She scorned to make use of the phalanx, her legions fighting in such open formation that those in the front rank could fall back, when weary, and allow those in the second file to advance and take their places, and yet the discipline and generalship of the great army was so perfect that it succeeded in establishing a wider empire than that of Alexander's, an empire which, in 133 B.C., included all of southern Europe from the Atlantic to the Bosphorus, as well as a part of northern Africa. Syria, Egypt and Asia Minor were then Roman dependencies. Her army had made her practically mistress of the civilized world. Several centuries elapsed before Rome's glories began to fade. During this time her power was still further extended, civil wars had been suppressed and revolutions crushed, for when the Roman army could fight according to the scientific rules of warfare it was practically an

invincible force. When the destroyers of the great empire came, however, they brought with them no knowledge of the science of war which Rome knew so well. To Alaric the Goth, Attila the Hun, and Genseric the Vandal, war was simply a question of mere numerical human strength. They had no more idea of the advancement in military art than had the Saracen horde that swept across the country and that might have planted the standard of Islam in every nook and corner of Europe if Charles Martel had not won his great victory on the plain of Tours. Against these three great barbaric leaders Rome was almost powerless, and as they swept down upon her, as one wave of the sea follows another, Rome fell, never to rise again. City after city was spoiled and burned; Rome, even, opened her gates without a blow. The tiara and purple robes of the empire were sent to Constantinople, and Zeno appointed Odoacer to be Patrician of Italy.

The Middle Ages.—From the fall of Rome and up to the close of the 15th century, wars were less frequent between nation and nation than among the various nations themselves. French fought French; Germans, Germans, and Spaniards, Spaniards, and even the war between the English and the French, the war that desolated France for more than a century, was no exception to this rule, for the enmity that was the cause of all the strife was not that of two rival nations, but was due entirely to the fact that the rulers of England were French princes, themselves hereditary sovereigns of French provinces, like Normandy or Poitou. Similar conditions existed in other parts of Europe so that the student who reads of the wars of the Middle Ages is struck by the absence of the well-planned and carefully executed campaigns that distinguished the warfare of both previous and later periods. There were civil wars, it is true; local insurrections, or single battles of more or less importance, but, with the exception of the invasion of the Saracens, the expeditions of Charlemagne, and the conquests of England by the Danes and the Normans, there is little to remind one of the well organized systems of warfare which distinguished the days of Greece and Rome, and which have since been revived by nations of modern times. It was not until almost the close of the Middle Ages that anything was done to improve the art of war as it was known to the ancients. Then the invention of gunpowder and the abandonment of armor revolutionized the science of fighting. Strange as it may seem, however, gunpowder was known for more than two centuries before the French, at the close of the 16th century, armed their soldiers with matchlock muskets, while conservative England, fearing that archery would be superseded, forbade the use of the new weapon as late as the time of Henry VIII.

Modern Warfare.—By Gustavus Adolphus, "the father of the modern art of war," as he is called by Col. Dodge, his biographer, the new weapon was accepted at its true worth, and, arming his corps with them he evolved the then original plan of preparing an attack with artillery. The adoption of the musket, however, was not the only development in warfare that may be traced to this great strategist, for it was he who first substituted the line for the mass formation, one of the greatest innovations in modern tactics.

WARS OF THE WORLD

It was not until the close of the Middle Ages, therefore, that military science, having slept for centuries, awoke to the possibilities of greater perfection in armament as well as in discipline. From the time of Gustavus Adolphus and Frederick the Great up to and after the close of the Civil War in America, military methods were undergoing such a change that the period may be regarded as that of the rehabilitation of the science of warfare, for nearly every kind of arm or maneuver that was in use during the Middle Ages has now become obsolete. In the accomplishment of all this improvement in armament and tactics credit is due to all the great generals, including Napoleon, who hired the best mechanics to make experiments for him and who gave to Europe its first breech-loader. Today, however, everything but the small calibre rifle, and possibly the bayonet, has been relegated to the scrap heap, just as the antique fighting tactics, like the various variations of the phalanx and mass formations have given place to a more and more open formation, as the perfection in the fighting arms has required such alterations in the fighting methods of the world's armies.

Decisive Battles.—Creasy, the historian of warfare, who treats of incidental battles rather than of connected wars, selects the following as the "Fifteen Decisive Battles of the World":

1. Marathon, at which, on 28 Sept. 490 B.C., 11,000 Greeks defeated a Persian force numbering more than 110,000 men. The Grecian army was commanded by such generals of genius as Miltiades, Aristides, and Themistocles. The Persian army was forced to retreat to Asia.

2. Syracuse, 419 B.C., when the besieged Syracusans turned upon the invading Athenians, almost completely destroying their forces, driving them, "with heavy slaughter, over the cliffs, which an hour or two before they had scaled full of hopes and confident of success."

3. Arbela, the battle between Alexander the Great and Darius Codomanus which decided the fate of the Persians; 1 Oct. 331 B.C.

4. Metarrus, at which Hasdrubal, the brother of Hannibal, was defeated and slain by the Roman army under the command of Livius and Claudius Nero; 207 B.C.

5. Teutoburg, 9 A.D., the battle at which Varus and the Romans were defeated by the Germans, and which was regarded at Rome as such a national calamity that Augustus is said to have cried aloud in agony, "Varus, give me my legions!"

6. Chalons, at which, in 451 A.D., Actius defeated Attila the Hun, compelling him to retire into Pannonia.

7. Tours, at which Charles Martel saved Europe by his great victory over the invading hosts of the Saracens. This conflict is also sometimes known as the battle of Poitiers; 732 A.D.

8. Hastings, at which, on 14 Oct. 1066, Harold II. of England lost his life and kingdom in battle against William, Duke of Normandy.

9. Orleans, besieged by the English during October 1428; it was bravely defended by Goucour, who realized that its fall would bring ruin to the cause of Charles IV. of France. On 8 May 1429, the siege was raised as the result of the heroism of Joan of Arc.

10. The Spanish Armada, the naval battle at which the Spanish fleet was almost completely destroyed by the British.

11. Blenheim, at which the French and Bavarians were defeated by the English under the Duke of Marlborough; 2 Aug. 1704.

12. Pultowa, where Charles XII. of Sweden was completely defeated by the Saxons; 1 May 1703.

13. Saratoga, the engagement regarded as the greatest check suffered by the British forces during the Revolutionary War in America. At this battle, fought on 17 Oct. 1777, the British general, Burgoyne, still flushed by his victory at Germantown, was obliged to surrender his entire force of 5,791 men to the American commander, General Gates.

14. Valmy, where the French, commanded by Kellerman, defeated the Prussians, commanded by the Duke of Brunswick, 20 Sept. 1792.

15. Waterloo, at which the great Napoleon was compelled to accept defeat at the hands of the Duke of Wellington's forces; 18 June 1815.

Wars of the World.—Irrespective of the character of the individual battles the following list of the most important wars that have been waged between the various nations since the Middle Ages is generally regarded as reasonably complete and thoroughly representative:

- 1455-1485. *The War of the Roses*, which ended with the defeat and death of Richard III. at Bosworth, 22 Aug. 1485. The war was between the Lancastrians and the Yorkists and obtained its name from the fact that the former wore the red rose as their emblem, and the latter, the white. The union of the roses was consummated in 1486, when Henry VII. was married to Princess Elizabeth, daughter of Edward IV.

- 1587-1588. *War of the Armada*. In 1587 Philip II., King of Spain, collected and equipped what he believed to be an invincible fleet, for the purpose of effecting the subjugation of England. Although it consisted of more than 130 ships and was manned by picked men, it was practically destroyed by the British fleet, commanded by Sir Francis Drake, Sir John Hawkins, and Lord Charles Howard, 29 July 1588.

- 1618-1648. *The Thirty Years' War* between the Catholics and Protestants of Germany. Beginning in Bohemia, in 1618, it ended with the Peace of Westphalia, 30 years later.

- 1648-1652. *The Civil War of the Fronde* may not be one of the great wars of the world, but it is so thoroughly representative of the conditions of the times that it is usually included in such lists. It originated in the minority of Louis XIV., and during the reign of Queen Anne of Austria and Cardinal Mazarin, and was strictly a war of classes. On one side were ranged the supporters of the court and the nobility, while the citizens supported by the Parliament, were arrayed against them. It ended with the ignoble defeat of Conde at the battle of Saint Antoine.

- 1702-1713. *War of the Spanish Succession*, a conflict which arose over the question whether an Austrian or a French prince should succeed to the throne of Spain. From the beginning the British court was opposed to Louis and the successes of the Duke of Marlborough would have delivered the throne to the Austrians if the allies, by withdrawing one after another, had not left the Bourbons free to succeed.

- 1741-1748. *War of the Austrian Succession*. At the death of Emperor Charles VI., his daughter, Maria Theresa, attempted to assume control of the throne which the great powers of Europe had guaranteed to her under the law known as the Pragmatic Sanction. Contrary to their agreement, however, all the powers except England determined to rob her of her inheritance. The plot failed and the peace of Aix-la-Chapelle was signed, Frederick the Great being the only monarch to profit by the conflict. He was bought off by the cession of Silesia.

- 1756-1763. *The Seven Years' War* was the result of Maria Theresa's determination to recover the Silesian territory which she had ceded to Prussia. By careful diplomacy an alliance was formed between Austria and France, Russia, Saxony, Sweden, and Poland, leaving England as the only power to which Prussia could look for support. Although it was believed that Frederick would be unable to stand against such odds he was so generally victorious that he was not only able to retain his control over Silesia, but his successes in battle established the position of Prussia as one of the five great nations of the world.

- 1775-1782. *War of the American Revolution*. The revolt of the American colonists as a protest against English oppression is one of the most serious conflicts in which England has been engaged, costing, as it did, the greater part of her American possessions. The war culminated with the signing of the treaty of Paris, 30 Nov. 1782.

- 1789-1794. *War of the French Revolution*. The uprising in France was distinctly a class awakening, but it resulted in the abolition of the monarchy and the establishment of the first republic. During this period of internal agitation, however, other nations took advantage of the supposed opportunity to meet France with less danger to themselves, and yet, during the very days when the Terrorists were sending their victims to the guillotine the republican army was enjoying such continued success that several threatened frontiers were pacified; Belgium was overrun; Holland conquered, and peace was signed with Prussia and Spain.

- 1796-1797. *In the Italian Campaign*, Bonaparte, the new military figure in European affairs, was given his first opportunity to exhibit his great genius for generalship, for with a force of 38,000 men destitute of everything but courage, he advanced upon three well-equipped bodies of the flower of Italian and Austrian soldiery, vanquished them and was already in the act of advancing upon Vienna when the Austrian govern-

WARS OF THE WORLD

ment, in consternation, asked for a suspension of hostilities. The treaty of Campo Formio, signed in 1797, was the result. By this France took Belgium and the long-coveted boundary of the Rhine, while Venice and its dependencies were apportioned to Austria.

1803-1815. *The Wars with Bonaparte*, which may be said to have commenced with Austerlitz and to have ended only with Waterloo, occupied the attention of Europe for more than 12 years. The third coalition, which was formed to resist Napoleon's projects of advancement, consisted of England, Austria, and Russia, but the "Sun of Austerlitz" went down upon a defeat so crushing that the conqueror was glad to accept the terms of the treaty of Presburg, even at the cost of the very existence of the Holy Roman Empire which had continued for more than 1,000 years. In 1806 a fourth coalition, composed of Prussia, Russia, and England, was formed, but in one day Napoleon annihilated their armies, and, entering Berlin, rifled even the tomb of Frederick the Great. A year later, 1807, saw the humiliation of Russia made complete, for while the battle of Eylau may be said to have been indecisive, there could be no question about the victory of Friedland, and Alexander, forced to sue for peace, signed the treaty of Tilsit. The Peninsula Campaign in 1808; the war with Austria, in 1809, and the war in Spain, 1809-12, were continuous exhibitions of the power of the French bayonets, and it was not until the Russian campaign, 1812, when the French army retreated from Moscow like a mass of straggling fugitives, that the powers of Europe saw an opportunity to shake off the yoke which the bold usurper had forced them to bear. Again there was a coalition formed, a gigantic confederation of power which included the forces of England, Russia, Prussia, and Sweden, and while Napoleon's new army succeeded in defeating the allies at Lutzen, Bautzen, and Dresden, his own fall at the terrible battle of Leipzig sent him back to Paris to prepare for the inevitable fate which Fortune had in store for him, the fate of Waterloo and his own abdication.

1812-1814. *The War of 1812* between Great Britain and the United States, which was caused by the aggressions of the British and their refusal to recognize the rights of the American republic on the high seas, resulted in the defeat of the English invaders. It concluded with the treaty of Ghent, signed 14 Dec. 1814.

1821-1829. *The Greek War of Independence* was the culmination of four centuries of Turkish bondage. Prior to this there had been several uprisings, all of which had been crushed with relentless cruelty, but the revolt that broke out in 1821 was of a different character, as many Europeans contributed both their money and their services to aid the Greek insurgents. During the contest which followed fully one half of the population is said to have perished, and the Turks, who had called the Egyptians to their assistance, seemed likely to overwhelm the revolutionists when England, Russia, and France formed a league to help the Hellenes. As the result the fleets of the combined forces defeated the Turks and the Egyptians in the bay of Navarino; the French troops drove the Egyptians from the Peloponnese, and freedom for Greece was at last attained.

1831-1839. *The Belgian War of Independence* was inspired by practically no other cause than that of a desire for freedom. The revolutions in America, in France, and in Greece were a means of inspiration, and as Belgium had never been in sympathy with Holland it required but a spark to kindle the flame of insurrection. In 1839, therefore, the independence of Belgium was declared.

1845-1848. *The Mexican War* with the United States resulted from the annexation of Texas, the independence of which had never been recognized by the Mexican government, and from Mexico's refusal to treat with the United States regarding the adjustment of the boundary. After several sharp engagements, in nearly all of which the United States forces were overwhelmingly victorious, Mexico was taken and peace was proclaimed, 4 July 1848.

1853-1855. *The Crimean War* grew out of a dispute between the Greek and Latin churches as to the right of exclusive possession of the Holy Places in Palestine. France and Russia took opposite sides upon the question, but when a mixed commission decided in favor of the Greeks and against France, the French acceded. Russia, on the other hand, continued to make demands upon the sultan, commanding, among other things, that the czar be recognized by treaty as the official protector of Christians within the limits of the Turkish domain. In 1853 the czar also proposed that England should join with him in partitioning the sultan's empire, a proposition which was immediately refused. In view of the strained relations, however, it was but natural that Turkey should declare war against Russia. In 1854 both England and France came to the sultan's aid, and an expedition against the Crimea having been decided upon, the allied forces, numbering nearly 60,000 men, attacked the Russians, who, under the command of Prince Menschikoff, had intrenched

themselves, 50,000 strong, on the heights of Alma, a position which was supposed to be unassailable. In spite of this, after one sharp contest, the Russians were routed. Peace was proclaimed in April 1856.

1856-1857. *The Persian War*. The taking of Herat by the Persians, 25 Oct. 1856, was considered such a violation of the treaty of 1853 by the British that war ensued between Great Britain and Persia. Several sharp battles followed, in which the Persian forces suffered defeat, and final peace was proclaimed in April 1857.

1857-1859. *The Indian Mutiny*, which continued for nearly two years, grew out of a revolt of the sepoy, or native soldiers in India. The original cause of the trouble was that the cartridges given to them were said to be greased with tallow or lard, which was regarded as an insult to their religion, a Hindu being forbidden to touch cow's fat; and a Mohammedan, lard. It was late in 1859 before the rebellion was finally crushed, while, in the meantime, the white residents at Delhi, Cawnpore, and many other places were massacred with terrible brutality. Those at Lucknow were just able to hold the city until relief arrived.

1861-1865. *The Civil War in the United States*, which resulted in the defeat of the Southern forces, the re-establishment of the Union, and the emancipation of the slaves.

1868-1899. *Cuban War for Independence*. Although the first attempt to wrest the island of Cuba from the hands of Spain was made as early as 1850, the first insurrection, or formal revolution, did not occur until the fall of 1868. From that time, however, revolutions were of frequent occurrence, but all were suppressed by the Spanish forces until 1898, when the United States formed an alliance with the revolutionists, thus enabling Cuba to obtain the freedom that had so long been denied.

1870-1871. The actual cause of the *Franco-Prussian War* was the jealousy of Emperor Napoleon, who had been an impotent witness of the success of Bismarck's negotiations, which had resulted in the greatly increased power of Prussia. More definite excuses were found, of course: the refusal of Prussia to permit the French to purchase Luxemburg from the king of Holland, and the effort of Bismarck to place Prince Leopold of Hohenzollern-Sigmaringen on the throne of Spain being two of them; but it is the consensus of opinion among historians that the war was both premeditated and unjust, and that as the emperor had been misinformed both as to the numerical strength of his army and to its state of preparation, his surrender was practically a foregone conclusion from the beginning of the conflict.

1876-1903. *The Anglo-Boer War*. Although separated by lapses of several years the hard feeling which always existed between Great Britain and the small South African republics resulted in many serious disturbances which culminated, in 1900, in the Anglo-Boer War, the complete victory of the English arms and the subjection of the South African farmers.

1877-1878. *The Russo-Turkish War*. The spirit of revolution which spread through nearly all the Turkish possessions during 1875 and 1876 and which resulted in the revolt of Bosnia and Herzegovina and Bulgaria, and the declarations of war by Serbia and Montenegro, was the immediate cause of the Russo-Turkish war, which ended with Russian victory, 3 March 1878.

1894-1895. *Chinese-Japanese War*. A revolt in Corea and a call upon China for assistance was the direct cause of the conflict between China and Japan. When the latter power, uninvited, sent troops with a proposal of joint action against the revolutionists, China protested vigorously, and, after much dispute, the war began. It resulted in Japanese victory and the cession of much territory on the part of China, considerable of which Japan was compelled to relinquish because of the protests of Russia, France, and Germany.

1898-1899. *The Spanish-American War* was the natural outcome of the interference of the United States in the war between Spain and her revolutionary colony, Cuba. Having fought with great bravery and against almost overwhelming odds for years the state of insurrection had degenerated into such barbarous cruelty on the part of those who were striving to suppress it that the American people decided that it had passed the bounds of humane warfare. For this, and several other reasons, Congress determined to give assistance to Cuba, upon which war was promptly declared. It resulted in overwhelming defeat for the Spanish forces, independence for Cuba, and the accession of considerable colonial territory by the United States.

1904. *Russo-Japanese War*. Russia's eagerness to extend her territory to such an extent as to secure ports that should be open at all seasons of the year—a desire which made her seize upon Manchuria with a firm hand and tempted her to cast covetous eyes upon Korea—was the cause of such strenuous objection upon the part of Japan that the Russo-Japanese war resulted.

WARSAW — WARSHIPS, ANCIENT

Warsaw, wâr'sâ, Ill., town in Hancock County; on the Mississippi River and on the Toledo, Peoria & Western railroad; 100 miles southwest of Peoria. Fort Edwards was established within the limits of the town in the War of 1812. The largest river steamers can ascend the Mississippi to the town; and it is a shipping point for the agricultural produce of the region. It also has several manufacturing industries, including cooperage works, flour and woolen mills, pickle works, and manufactories of agricultural implements. It contains a public high school. Pop. (1890) 2,721; (1900) 2,335.

Warsaw, Ind., city, county-seat of Kosciusko County; on the Tippecanoe River, and on the Pittsburg, Ft. W. & C., and the Cleveland, C. C. & St. L. R.R.'s; 105 miles north of Indianapolis. It was settled in 1836, and chosen as the county-seat in 1837; it was incorporated as a town in 1854, and as a city in 1867. It is in a lake region, and is popular as a summer resort. It is also an agricultural region, and Warsaw is the chief trade centre of the county. It has large canning and pickling works, flour mills, creameries, and manufactories of agricultural implements. A large park and the county court-house are among its notable features. There is also a public high school established in 1872, and a public library. Pop. (1890) 3,574; (1900) 3,987.

Warsaw, N. Y., village, county-seat of Wyoming County; in the valley of the Oatka Creek, on the Erie, and the Buffalo, R. & P. R.R.'s; 40 miles south-southeast of Buffalo. It was first settled in 1804, and was incorporated as a village in 1816. It is in an agricultural region; and there are important salt deposits in the vicinity. The village contains salt works, broom factories, manufactories of knit goods, a foundry, carriage factories, lumber and saw mills. It has a public high school, established in 1897, with a large library of about 15,000 volumes (1904). The water-works are owned and operated by the village. Pop. (1890) 3,120; (1900) 3,048.

Warsaw, Russia, the former capital of Poland and now of a government, situated partly on a flat, and partly on a height rising gradually from the left bank of the Vistula, here crossed by an iron bridge 1,600 feet long, and by a railway bridge, communicating with the suburb of Praga, 325 miles east of Berlin. It consists of the city proper and several suburbs, enclosed for the most part along with it by a rampart and fosse, and dominated by a vast citadel erected by the Russians. In the older parts the streets are narrow, and the houses, generally of indifferent appearance, are huddled together without any order; in the newer part, and more especially in some of the suburbs, the streets are often spacious and many ranges of handsome buildings are seen. There are several large public squares, among which that of Sigismund, adorned with a bronze colossal statue of the third king of that name, is particularly deserving of notice; and the vicinity is well provided with beautiful promenades. The more remarkable public buildings are the Roman Catholic cathedral, the Russian cathedral, the church of the Holy Cross, the church of the Carmelites, the Lutheran Church, the Zamek or ancient castle of the Polish kings, a huge

pile on a height overhanging the Vistula; the palace of Casimir, occupied by the university and adorned in front with a statue of Copernicus; the Saxon palace, with fine gardens attached to it; the Krasinsky palace, occupied partly by the superior courts of law and partly by government offices; several other palaces similarly occupied; the town-house, arsenal, mint, custom-house, exchange, barracks, several theatres, and the bazaar of Mariaville, consisting of a large square lined with arcades. The principal educational establishments are the university, suppressed after the rebellion of 1830, reopened in 1864; a lyceum, technical, commercial, and many other schools. Among the benevolent institutions are a town and a military hospital, a foundling hospital, a deaf and dumb, and two lunatic asylums. The manufactures consist of metals, beer, tobacco, textiles, chemical products, furniture, artificial flowers, musical instruments, etc. The trade is very extensive, Warsaw being by far the most important commercial emporium of Russian Poland, and carrying on a large traffic both with the interior and with Thorn and Dantzic, by means of the Vistula. Warsaw, though very ancient, did not become the capital of Poland till about the middle of the 16th century, when it superseded Cracow. It has witnessed much warfare, the suburb Praga generally being the field of action. Here in 1656 the Poles were defeated by Charles Gustavus of Sweden. The chief interest belonging to the city is connected with the insurrection of 1794, when after the capture of Kosciusko at Maciejowice, the dispirited and disorganized remnants of the Polish army defended the ramparts of Praga against the victorious Russian forces under Suwaroff. On 3 Nov. 1794, the Russian general ordered an assault, and after a fierce struggle the ramparts were carried, more than 15,000 Polish soldiers being slain, drowned in the Vistula, or taken prisoners, and an almost equal number of unarmed inhabitants of every age and sex, brutally massacred. In the evening a great fire arose, which destroyed a large part of the city. The vicinity of Warsaw was also the principal seat of the Polish war in 1831. Pop. (1897) 638,208, of whom above a fourth are Jews.

Warships, Ancient. Armorclads and protected war vessels were not wholly unknown to the ancients. The ships of the Greeks and Romans were often fortified with a thick fence of hides, which served to repel the missiles of their enemies and afford protection to their own crews. Hides, possibly brass and iron, and certainly thick timber, entered into the construction of the turrets and towers with which the fighting ships of ancient and mediæval times were fitted, especially when used for harbor defense, as in the Venetian turret ship of the 9th century. Felt made an early appearance as a defensive armor on shipboard, as we find that in a sea fight off Palermo in 1071 between the Normans and Saracens, the former hung their galleys with this material by way of a defensive cuirass. The Norman knights had probably adopted this device from their enemies, for felt had been used for some time for this purpose on board the huge "dromons" of the Saracens. These, the "battleships" of those days in the Mediterranean, usually rowed 50 oars a side, each oar being manned by two men, so that here we have a couple of hundred seamen ac-

WARSHIPS, ANCIENT

counted for at once. When the soldiers, sail trimmers and artificers who worked the war engines and siphons for Greek fire are added, it is evident that the crew must have been very large, and have required a ship of considerable dimensions. These great warships were armored with woolen cloth soaked in vinegar to render it fireproof, and hung with mantlets of red and yellow felt, so that their cuirass was not only useful, but ornamental as well. At this period and for many hundred of years later additional protection was afforded to those on deck by the ranging of the bucklers and shields of the warriors on board along the gunwales. Later, in the 15th and 16th centuries, special "pavesades," or bulwarks, were provided in lieu, composed of large oblong shields, supplied for the purpose. In addition to felt, the time-honored leather armor also entered into the defensive panoply of the "dromons," and in the war of the Sicilian Vespers, Pedro III. of Aragon covered two of the largest ships of his fleet with leather before sending it against Charles of Anjou. Conrad of Montferrat, at the siege of Tyre in 1187, either invented, or at all events, caused a special class of leather-protected vessels to be built, which were called barboats or duckbacks. They would now probably be called turtlebacks. They would appear to have been small craft covered with a strong leather-protected domed roof through portholes or openings in which the archers and crossbowmen could fire without exposing themselves. They proved very effective against the Saracens, and in 1218 the entrance of the Nile was forced by 70 of these little armorclads.

It is said that the Great Dromon—whose capture by Richard Lion-Heart is still commemorated—was equipped with leaden armor. This was in 1191, and probably lead was occasionally used for protective purposes throughout the next two or three centuries, although there is no record of any ship so protected until 1530. In this year the Knights of Saint John, those sworn opponents of the Turk, built one or perhaps two leadclads. At any rate, one account says that they built such a ship in this year at Malta, while another describes a ship of this kind called the "Santa Anna," launched at Nice in the same year. The Santa Anna's leaden armor plates were attached to her sides by bolts of brass, and it was said for her that she could "resist the artillery of a whole army," and at the same time could sail or row as fast as any of her unarmored contemporaries. She was a big ship, with six decks, a reception saloon, a chapel, a specially constructed powder magazine and a bakery. She was present at the taking of Tunis in 1535 and played an important part in its capture. Lead was not infrequently used at this period for sheathing ships under water, in the same way that copper is still found so useful. Thus the French ship *Grande-Françoise*, launched in 1527, one of the largest and most famous ships of her day, was sheathed with lead from her keel to the first wale above her waterline.

The Spaniards attempted to protect their galleons of the Invincible Armada by building their sides four or five feet thick, but the heavy English guns "lashed them through and through." But now at last we arrive at a real armored ship in the present day acceptance of the word. Not only an armorclad, but a real

ironclad. This was constructed in Antwerp in 1585, with a view of breaking through the lines of the Spanish army under Alexander of Parma, which was at that time closely investing the city. It was a large flat bottomed craft, with a central casemate or battery built of thick balks of timber and plated with iron. It was intended to be, and very likely was, impenetrable to any artillery that the Spaniards could bring against it; and in hopeful anticipation that their ironclad ship would raise the siege and put an end to hostilities, the men of Antwerp christened her the "Finis Belli." In addition to a heavy battery of guns, the *Finis Belli* carried a large body of musketeers, some of whom were stationed aloft in her four fighting tops, while the rest were well protected by the loopholed bulwarks on the upper deck. Unluckily for the besieged Dutchmen, she ran aground before she had effected anything at all, and fell into the hands of the Spaniards, who nicknamed her the *Caranjamula*, or "Bogey." They contrived to get her afloat, and brought her down to the camp of Alexander of Parma, where she became a great attraction to the sightseers of the period. As for the Dutchmen in the doomed city, they henceforward only referred to their experiment as the "Perdita Expensæ" or "Wasted Money." Ten years previous to this, others of the Dutch patriots had built a somewhat similar contrivance, which very possibly was also armored. This was the *Ark of Delft*, a twin vessel supporting a floating fortress, which was propelled by three hand-worked paddle wheels placed between the two hulls.

It is a curious but well known fact that if we go to the Far East we can find a parallel to almost any Western invention. It is therefore not astonishing to find that the Japanese possessed a paddle-propelled armorclad in the year 1600. This quaint craft, like the old leather-clad "barbotes" of the 12th century, was turtlebacked, with ports for firing from. She was covered with iron and copper plates fitted together like the cells of a honeycomb, mounted 10 guns, and, like the *Ark of Delft*, was moved by a central paddle wheel. Though there is no record of any more ironclad ships before the 19th century, our own navy, at any rate, used various devices to protect its ships in the 18th. According to a French writer, the sailors of his country were astonished at the perfection to which the English had attained in this direction. "Old cables," he writes, "held in place by pieces of iron, barricaded the whole length of the bulwarks; mantlets of old rope hung over the ship's sides, to diminish the shock of our cannon balls, and, beneath a thick rope, netting stretched from poop to bowsprit. The English fought under shelter, maneuvering, without ceasing, out of musket range, so as to riddle our detachments of fusileers, with their cannon shot. So we lost 200 men for every 30 of the English put out of action."

This system of armoring was, however, soon adopted by the French. The Spaniards endeavored to improve on this, and in 1782 hoped great things from the celebrated floating batteries employed at the great siege of Gibraltar by the Duke de Crillon. The floating batteries were mounted on ships of the line, cut down to a particular size. On the top they were defended by a covering made of cordage and wet hides. This was not the complete protection

WARSHIPS, MODERN

that was originally intended by the Chevalier d'Arcon, their constructor, according to another account of the same date as the above, which states that "the covering was to have been laid over with strong sheets of copper, and by this means the redhot balls, the bombs and other destructive implements would have slid off."

The fate of these experimental armorclads offered no inducement to the naval constructors of the day to make further researches in the direction of protection, so that till comparatively recent times we find our sailors depending only on their "wooden walls" to resist the projectiles of the enemy. The oaken sides of the British ships, we may note in passing, were often exceptionally stout and difficult to penetrate. In the fight between the *Glatton*, 56-gun ship, and four French frigates, a brig and a cutter, mounting 220 guns between them, their 12 and 24-pounders failed to penetrate her sides, and she beat them all off with great loss at the cost of one officer and one man wounded.

But the Americans, from the very commencement of their existence as a nation, set themselves to make improvements in naval warfare. David Bushnell constructed a practical submarine boat in 1773. Torpedoes were used by him and others in the war with this country, and for the purpose of towing these contrivances alongside our ships, they invented and built in 1814 a paddle-propelled turtlebacked boat lying very low in the water and covered with "half-inch iron plates, not to be injured by shot." About the same period the celebrated inventor, Robert Fulton, who had already constructed one or two submarine boats and various classes of torpedoes, built a steam frigate which he called the *Demologos*, or *Voice of the People*, but which is sometimes known as the *Fulton I*. This, the first steam warship ever constructed, had her sides no less than 13 feet thick of alternate layers of oak and ash wood, a thickness absolutely impenetrable by any gun then afloat. In 1820 this vessel was blown up by accident, and was succeeded in the American navy by the *Fulton II*, a ship which appears to have been protected by some kind of iron armor.

Various proposals were made to use iron plating to protect the sides of ships of war from this time forward, but until the French constructed a number of armorplated batteries for use in the Crimean war, nothing practical came of the suggestions of inventors. Their success at the bombardment of Kinburn demonstrated the value of armor plating. England at once followed suit with others of the same kind, some of which are still doing duty as hulks. Then came the French *La Gloire*, the British *Warrior*, the ironclads and monitors of the American war, and henceforward the steady evolution of the armored fighting ship, which has provided us with the majestic battleships of the present day.

Warships, Modern. It has become almost an axiom that military success, in a broad sense, depends upon command of the sea, and absolute command of the sea can only be attained in one way, by the capture or annihilation of the enemy's fleets. This makes it imperative that the enemy be met in battle, a result easily attained if he is of equal or superior force and, if his force is inferior, he must be made to fight. The questions of how, and when, and

where this should be done belong to the science of naval strategy, for our purpose it is enough to recognize that the destruction of his fleet is the paramount object, we may then turn to consider what means have been provided for accomplishing this end. It can readily be seen that this serious problem of bringing the enemy to battle and making him fight, whether he will or not, can only be met by providing vessels capable of navigating the seas in any weather, and capable of meeting and destroying, or fighting to a standstill, any class of vessel that may be brought against them. In the old days, when all ships were on an equal footing as regards the motive power, when there was no protection and when the best ship was the one carrying the most guns, the problem was simple: but now, when each vessel must carry her own fuel, when high speed requires a disproportionate share of space and weight, when the competition between gun and armor has developed so rapidly that each series of new guns requires either thicker or better armor for protection against its projectiles, the problem is much more complex, and though of late years the steel maker and the engineer have done much toward improving the quality of their products, its principal result has been to increase the quantity used in a given case.

Qualifications.—Having seen that the primary purpose, indeed the *raison d'être* of the true warship is to fight, it follows that the most efficient war vessel, in the sense of the present day, is that combining in the highest degree, offensive and defensive qualities. It may be said in a general way, that the most important of these qualities are armament, protection, radius of action, speed, and reliability of machinery. There are, however, great differences of opinion among naval experts and designers as to the relative importance of these qualities, which are all further complicated by subordinate and antagonistic elements, and to unite the whole, in the best possible ratio, is the aim of the designer of every warship projected. The above mentioned qualities may be altered proportionately, increasing one and decreasing another, but in every case there is one absolutely limiting factor which cannot be ignored, that is the total weight which a given vessel can carry. A ship of definite displacement can carry a certain number of tons weight with safety, and this weight may not be increased, so it follows that if any one quality is abnormally developed, some other quality or qualities, no matter how important, must be sacrificed. Thus every warship is a compromise in which the designers must nicely balance each element, an addition for some especially desirable feature entailing a reduction in something else considered not quite so important in view of the particular service to be required of the vessel. Being driven to these compromises and owing to the impossibility of uniting these discordant elements, each in its highest degree of excellence, in any one ship, designers have been forced to divide warships into a number of different classes, each class to fulfil special requirements and in each one of which one or more qualities reaches its highest development in accordance with the requirements of its class and the duties to be performed by the finished vessel.

WARSHIPS, MODERN

Classification.—The principal classes of warships which exist at the present time, as the result of an evolution along diverging lines enforced by the mutual antagonist qualities are: battleships, armored cruisers, protected cruisers, gunboats, monitors, torpedo boats and destroyers, scouts, and some intermediate types combining the characteristics of several classes. In the navies of the larger powers, where expense need not be considered and where the number of vessels must perforce be large, the lines between the classes are fairly well defined; but in many of the smaller navies the effort has been to combine in one vessel too many high qualities, usually resulting in an inferior ship and one excelling in no respect, though there are a few cases of this kind where an exceptionally skilful designer has been remarkably successful in his combination of elements.

Before going into a detailed description of the different classes of warships it may be well to take a general survey of the subject and to revert to the principal qualities before mentioned. The statement that a vessel is constructed entirely of steel, implies no inherent strength in itself. All war vessels are now built of steel, and it is only when thick steel plates are secured to their sides or deck, for the express purpose of protecting their machinery, magazines, guns, and personnel from the fire of the enemy, that any advantage is derived from it. Beginning with the lighter ships, such as torpedo boats, small gunboats, etc., we find there is no protection whatever except, in some of the gunboats, that given by a judicious arrangement of the coal bunkers, and the slight protection afforded the gunners by the gun shields. On some of the larger gunboats and on all of the protected and armored cruisers as well as battleships we find the protective deck, a heavy steel deck, covering the whole of the vessel at about the level of the water line and protecting the machinery, boilers, magazines, etc. On some of the larger protected cruisers thin side armor appears; on the armored cruisers there is thicker side armor covering a greater area and, on this type, the turret or barbette appears, while on the battleship the protection reaches its highest development.

Battleships.—The battleship represents the highest type of warship evolved at the present time, and from a purely military standpoint it is the most formidable and most necessary class of vessel, for upon the battleships fall the real burden of an offensive demonstration. The marked characteristics of the battleship are large guns and thick armor and these are the two qualities to which other elements, noticeably speed, are sacrificed. This sacrifice, however, must be made, for the battleship must bear the brunt of the heavy fighting and be able to give and receive the hardest possible blows. Speed is an important element and it is well for the battleship to have the highest speed possible as long as it entails no reduction in her fighting qualities; but speed never won a decisive battle and of all the elements entering into warship design high speed is the most uncertain, the most difficult to maintain in a high degree of efficiency, and it requires the greatest sacrifice in other qualities. The reason for this is that in a given ship the power, and consequently the weight and space occupied by the machinery necessary for an increase in speed, increases

in a much higher proportion than the speed gained. Thus a battleship that could make 17 knots with 12,000 horse-power, the machinery installation weighing 1,150 tons, would require, to make 20 knots, about 27,000 horse-power, the machinery weighing 2,570 tons. In addition to this, her greater power would involve a greater consumption of fuel per day, therefore a greater quantity or weight of fuel must be carried and, as before stated, the extra weight for machinery and fuel could only be obtained by a reduction in the armament, or protection, or both, or by an increase in size. When one notes that on a modern battleship the armament and ammunition is about 9 per cent, the protection about 25 per cent, the propelling machinery about 12 per cent, and the coal about 6 per cent of the total displacement, it can easily be seen how seriously a change in any one of these items affects the whole ship. The armament or battery of warships is divided into two classes, called respectively, the main and the secondary batteries. The main battery comprises the heaviest guns on the ship, those firing large shells and armor-piercing projectiles, while the secondary battery consists of small rapid-fire and machine guns for use against torpedo boats, or to attack the unprotected or lightly protected gun positions of an enemy. On the modern battleship the main battery usually consists of four 10-inch, 12-inch, or 13-inch breech-loading guns, mounted in pairs in revolving barbette turrets, one forward and one aft, on the centre line of the ship. Occasionally these guns are mounted *en barbette*, that is, the gun projects over a circular wall of armor, without the revolving turret or hood; it is not uncommon also, in foreign navies, to find but one gun in a turret or barbette, and sometimes these turrets or barbettes, instead of being placed on the centre line of ship are *en echelon*, that is, the forward one on one side of the vessel, the after one on the opposite side. However, it is the almost universal practice at the present time to place the four heaviest guns as first stated, in pairs, in revolving barbette turrets, on the centre line of ship. In addition to these heavy guns it is usual to mount a number of smaller guns, from 5 to 8 inches diameter of bore, on each broadside, though often the 8-inch guns are also mounted in turrets. A battery arrangement that has obtained to a considerable extent in our navy is to have, in addition to the two turrets of 12- or 13-inch guns, four smaller turrets, each containing two 8-inch guns. These turrets are arranged in a quadrilateral, two on each side, the forward two somewhat abaft the forward large turret, and the after two forward of the after large turret, with in addition to this, a number of 6-inch or 7-inch guns mounted on the broadside. Later this arrangement has been somewhat changed by superposing one of the 8-inch turrets on each of the large turrets, the other two in some cases being placed one on each side of ship about amidships, while in other cases they were omitted entirely, their place being taken by a greater number of broadside guns. The *Indiana*, the first of our battleships, has the two large turrets referred to, each containing two 13-inch guns, the quadrilateral arrangement of four turrets each with two 8-inch guns and two 6-inch guns on each broadside. Next came the *Iowa* with a somewhat similar arrangement except that 12-inch and 4-inch guns were used in place of the 13-inch

ENGINES OF THE "WISCONSIN."

CYLINDERS: High Pressure, 33½ inches; Intermediate, 51 inches; Low Pressure, 78 inches; Stroke, 48 inches.

WARSHIPS, MODERN

and 6-inch guns respectively. She was followed by the Kearsarge class, with 4 13-inch guns in turrets, arranged as before, with a turret mounting 2 8-inch guns superposed on each 13-inch turret, and with a broadside battery of 14 5-inch quick-fire guns. Next came the Alabama class, with 4 13-inch guns, in the large turrets, no 8-inch guns at all and 12 6-inch guns on the broadside. After the Alabama class the 13-inch gun disappears, and in the Maine class, which followed, there are 4 12-inch, no 8-inch and 16 6-inch quick-fire guns. The Virginia class shows a return to the 8-inch gun, her arma-

the above we have confined ourselves to a description of the battery arrangements on the battleship class only. In the armored cruiser class a somewhat similar arrangement is followed, except that the guns in the main turrets are not above 10-inch bore, and are often 8 inches. As to the protected cruisers and gunboats, their batteries are so varied that they can best be considered by consulting the table which gives the batteries of a number of different classes of vessels.

The protection, that is, the armor on a battleship, is her most marked characteristic. The

9,500 I. H. P. Main Engine of a Battleship.

ment being 4 12-inch, 8 8-inch and 12 6-inch guns. On the Connecticut and Vermont classes, our largest battleships, we have 4 12-inch, 8 8-inch, and 12 7-inch, the latter being a new gun used here for the first time. On the latest battleships, the Mississippi class, we have 4 12-inch, 8 8-inch and 8 7-inch guns. The superposed turret was entirely an American idea and has not yet been introduced abroad. It has the advantage that, the number of gun positions being reduced, better protection can be given the guns and their accessories on the same weight, or the same protection given on less weight, leaving an allowance of weight to be used elsewhere. In

basis of all protection on the modern war vessel is the protective deck and it is common to the battleship, armored and protected cruisers and many gunboats. It is a heavy steel deck covering the whole of the vessel at or a little above the level of the water line, extending the entire length of the ship and firmly secured at the ends to the heavy stem and the stern post, and at the sides it usually slopes, meeting the sides of the ship 3 or 4 feet below the water line. Below this heavy deck lie the vitals of the vessel, the boilers and machinery, the magazines and shell rooms, the ammunition passages and all the parts where an explosion would be most dan-

WARSHIPS, MODERN

gerous and would create the greatest havoc. For safety every opening on this deck is covered with a heavy steel grating to prevent, as far as possible, fragments of shell from passing below. The most vulnerable part of the vessel is her water-line, for, if a shell should enter and explode here, tearing a large hole, she would probably quickly capsize and sink; it is here therefore that the heaviest armor, called the water-line belt, is usually placed. The lower edge of this belt rests on a projection or ledge, called the armor shelf, at the point of meeting of the protective deck and the ship's side; it is therefore 3 or 4 feet below the water-line and extends up about the same distance above. In the earlier battleships it was usual to run this

H. P. Cyl. Port Engine of Battleship, Looking Forward.

water-line belt the length of the machinery space only, leaving the ends of the vessel unprotected; this was considered dangerous, however, as penetration at these unprotected ends would probably have serious consequences, so, as armor improved in quality, enabling thinner and therefore lighter plates to be used, the weight so gained was utilized by continuing the protection, at a reduced thickness, all the way to the bow and stern, thus protecting as far as possible the

whole water-line of the vessel. The barbettes, one forward and one aft, about over the magazines, rest upon the protective deck at the bottom and extend up about four feet above the upper deck. At the top of the barbettes, revolving on rollers, are the turrets, sometimes called hoods, containing the guns and the loading mechanism and all of the machinery in connection with the same, and the turret ammunition hoists lead up through the barbettes from the magazine below, delivering their load of charge and projectiles at the breech of the guns in position for loading and, as they pass up inside of the barbettes and turrets, they are as well protected as is possible. It is usual to work an athwartship line of armor from the water-line belt to the barbettes, resting upon the protective deck, and this athwartship or diagonal armor is here the same thickness as the belt. We now have, enclosed within heavy armor a fort, citadel or redoubt, its bottom being the protective deck, its sides the water-line belt, and its ends the athwartship or diagonal armor, a barbette being placed at each end of the citadel, thus the space between the protective deck and the next deck above is well protected. Resting upon the armor belt and the diagonal armor, and following the same direction, is a course of armor usually somewhat thinner called the lower casemate armor; it extends up to the lower edge of the broadside gun ports and, resting upon it in turn is the upper casemate armor, following the same direction and forming the protection for the broadside battery. The explosive effect of the modern shell is so tremendous that were one to get through the upper casemate and explode immediately after entering, it would undoubtedly disable several guns and kill their entire crews; it is therefore usual to isolate each broadside gun from its neighbors by light nickel steel bulkheads $1\frac{1}{2}$ or 2 inches thick, and, to prevent the same disastrous result among the guns on the opposite side, a fore-and-aft bulkhead of about the same thickness is placed on the centre line of the ship. Each gun of the broadside battery is thus mounted in a space by itself, somewhat similar to a stall. Just abaft the forward turret there is a vertical armored tube resting on the protective deck and at its upper end is the conning tower, a protected station from which the ship may be worked in action, the tube giving protection to all the mechanical signaling gear leading to different parts of the ship, the steering gear, etc., while just forward of the after turret is another armored station for signaling. It is not a difficult matter to design a ship that will be practically unsinkable by the attack of gun fire, as it only means placing a sufficient thickness of armor at the water-line. A war ship might as well be sunk, however, as rendered useless in battle, and the one thing that modern naval battles have shown is the absolute impossibility of the unprotected personnel of a ship working her guns when exposed to the hail of shot and shell from a modern battery of rapid-fire and automatic guns; as a result of this we see all the later battleships, armored cruisers and protected cruisers increasing the protection of the broadside batteries and exposed gun positions, even at the expense of the water-line belt. It has also been advocated lately to do away entirely with the protective deck, thus gaining many tons weight which

MODERN WAR-SHIPS

1. PROTECTED CRUISER "MILWAUKEE," LAUNCHED SEPTEMBER, 1904.

DISPLACEMENT, 9,700 tons. SPEED, 22 knots. BUNKER CAPACITY, 1,500 tons. ARMOR, Belt, 4 inches. ARMAMENT: Fourteen 6-inch R. F., eighteen 3-inch R. F., twelve 3-pounder semi-automatic; four 1-pounder automatic; two 3-inch field guns; two 0.30-caliber machine guns; eight 0.30-caliber automatics. COMPLIMENT, 645.

2. BATTLESHIP "CONNECTICUT," LAUNCHED SEPTEMBER, 1904.

WARSHIPS, MODERN

could possibly be used to better advantage elsewhere. The foregoing description, in a general way, portrays the disposition of armor usually employed on the battleship type, but it may be considered to apply as well to armored cruisers, remembering that in the latter class of vessel the armor is thinner all through. The design and building of battleships shows a constant development. Each new vessel is, in many respects, an improvement on her immediate predecessor; there is some uncertainty, however, as to the best type, due to the fact that there have been no naval engagements, since the modern warship was evolved, of sufficient importance to settle beyond question whether this development is along correct lines or not. The trend of development, however, has been in the following directions: for the battleship, a reduction in the size of the largest guns, made possible by im-

capacity. Captain Walker, U. S. N., has said of the armored cruiser: "Her role . . . is assumed to be that of a vessel possessing in a high degree offensive and defensive qualities, with the capacity of delivering her attack at points far distant from her base in the least space of time." For this statement to apply to the modern armored cruiser, remembering that the ability to fight must be measured by the standard set by the battleship, it should be reversed and the degree should read "moderate" instead of "high." There is no class of warship concerning which there is a greater diversity of opinion. Many eminent authorities hold that the armored cruiser, with a speed enabling her to give or decline combat at will and to overtake protected cruisers and commerce destroyers, with an armament sufficient to ensure the destruction of such vessels when overtaken, and with suf-

4,000 I. H. P. Main Engine of a Destroyer.

provements in material and higher velocity of projectiles; an increase in the size of rapid-fire guns; a much improved quality of armor, with a greater proportion of the ship covered by same; an increase in speed and coal capacity, and a saving in machinery weights due to the introduction of the water tube boiler and to a generally higher grade of material; and finally an increase in size of the whole vessel. For the armored cruiser almost the same advance has been made as in the battleship, and in many respects the armored cruisers are merely battleships somewhat weakened in defensive and offensive qualities to gain a few knots speed.

Armored Cruisers.—The armored cruiser can best be described as a battleship in which the qualities of offense and defense have been much reduced to gain high speed and great coal

sufficient armor to protect her from the guns carried by such ships and possibly sufficient to enable her to engage a battleship under conditions favorable to herself and of her own choosing, adds a very important element of fighting strength to the fleet, and that in this class the requirements of warships are most nearly fulfilled. On the other hand there are many who hold that the armored cruiser is an anomaly, something less than the battleship and more than the protected cruiser, performing satisfactorily the duties of neither, with no special function of her own and lacking the great desideratum in warships, ability to fight in proportion to her great size and cost. With the increase in speed of the battleship until there is only a difference of about 3 knots between its speed and that of the armored cruiser, and this differ-

ence most apparent on the trial trip, as any decrease in efficiency will necessarily be most severe on the faster type, and when this gain of a few knots speed is at such an expense of armor and armament as to practically preclude the armored cruiser from joining battle with the battleship, it hardly seems worth while to put practically the same amount of money into vessels of the weaker type. There is doubtless a large field for the armored cruiser in swift attack upon isolated or unprotected positions, in raids on the trade routes of maritime states or in blockade and many other duties; but, before the end is reached, the enemy's battleship squadron must be met, and this the armored cruiser can not do, at least with much prospect of success. Prophecy is always an uncertain occupation, but judging as well as we can from the present line of advance, it would seem most likely that this debatable question will be met by increasing somewhat the speed and coal endurance of the battleship and reducing slightly her protection at the water-line or possibly in the protective deck, while the armored cruiser reduces her speed somewhat and increases her armor and armament, until the two types merge. Aside from speculation, however, the consensus of opinion seems to be that the more recent armored cruisers in all the great navies are too large. However this may be, the fact remains that, if any one country develops a type of warship having particularly marked characteristics, other nations who wish to remain on a footing of equal strength, must build vessels of the same type to meet them, and all of the more important naval powers are now adding armored cruisers to their fleets. It may be of interest to add that France, at the present time, is building armored cruisers almost to the exclusion of battleships, and it must not be forgotten that the French nation has, on other occasions, inaugurated the line of naval development. The preceding table gives the particulars of battleships and armored cruisers, built and under construction, in the United States navy.

Protected Cruisers.—The protected cruiser class depends for protection upon the protective deck alone. These vessels were very popular in all navies some years ago, and in them everything was sacrificed to what was considered at that time high speed. The Japanese Naniwa, 3,050 tons displacement and 18¾ knots, and the Chilean Esmeralda, 3,000 tons displacement and 18¼ knots speed, were considered phenomenal vessels and were regarded as models. Owing to the difficulty of a small ship maintaining high speed in anything but the most favorable weather, vessels of this class gradually increased in size until they reached 7,000 or 8,000 tons displacement. Being without any protection save the protective deck, these vessels could be utterly destroyed by the fire of modern rapid-fire guns even though neither their protective decks nor their water-lines were pierced, in fact they were not much better than armed ocean liners. After a few years the armored cruiser came out, immeasurably superior, and naval designers quickly turned to that type. It is probable that the protected cruiser will be modified, and her place taken, as far as speed is concerned, by a new type, just now being developed, the Scout. As its name implies this type will be very fast, 23 to 25 knots, with large coal capacity and no protection. The Scout class is not designed to

fight but rather to act as the eyes of the fleet. They are of good size, 3,000 to 4,000 tons displacement, with fine lines for speed. Their duties will be to discover and keep in touch with the enemy and to carry news to their own battle squadron; they will also be capable of destroying

Torpedo Boat Destroyer.

torpedo craft. As to unprotected cruisers and gunboats, while necessary in times of peace for general police of the seas and to show the flag in foreign ports, they are of no use in battle except against unarmored vessels. A table giving the particulars of the protected cruisers in the United

WARSHIPS, MODERN

States will be seen on two of the following pages.

Monitors.—The monitor is a strictly American type and is dear to the American heart on account of the service the first monitor did the country in the Civil War, by defeating the Confederate armored ram Merrimack, or Virginia as she had been renamed. The monitor, being very low in the water, with her water line heavily armored and her upper deck only three or four feet above the surface, affords a very small target, and that well protected, for an enemy's shot; this same quality, however, makes her a very poor sea-boat as, in bad weather or any sea, her deck is awash and it is impossible to work her guns. For harbor or coast defense, however, the monitor has no superior in the minds of many, and we have recently completed four new monitors for this purpose, the Arkansas, Nevada, Florida, Wyoming. Of course there is more or less discomfort in life on board a vessel of this class, as all living quarters are below the water line and artificial ventilation and light must be used constantly, still it is not as bad as might be expected and one becomes accustomed to the conditions. (On one of the preceding pages may be found a table giving particulars of monitors now in the navy.

Torpedo Boats.—In the torpedo boat we have reached a class of vessel in which there are practically no qualities of defense and in which the weapon of offense has changed from one of precision, the gun, to one of great uncertainty, the torpedo. The torpedo boat depends for success in her attack upon both her small size and her speed, and largely upon the elements of surprise and secrecy; indeed secrecy is vital to her, as discovery means, at the least, failure in her attack, and it is generally admitted that in an attack by a torpedo boat on a warship, say a battleship, if the torpedo boat is discovered in anything like reasonable time her destruction is assured. The rapid-fire and automatic guns discharge such a stream of projectiles that it is highly improbable a torpedo boat, once discovered, could get within range to use her weapon effectively. This virtually precludes all idea of torpedo attack by daylight and even at night the conditions are not all favorable. The torpedo boat when running at high speed rides on the crest of a wave created by herself, and the white spray and foam that accompany this wave are picked up by the battleship's searchlight long before the boat herself can be seen; in addition to this, at high speed her presence is betrayed by flames and sparks pouring from the stacks. On the other hand in thick weather, in rain or in fog, the boat has a good chance against the battleship or cruiser, and the knowledge held by a blockading fleet that a number of torpedo boats were in the shelter of the harbor awaiting an opportunity to attack, could not fail to have a telling moral effect upon their crews and would require the ships being kept in constant motion and moving much farther out to sea at night. Torpedo boats should be small, as the larger the boat the more easily she will be discovered. On the other hand a small boat is unseaworthy, hence there is a natural division into harbor defense and sea-going boats, and roughly speaking a sea-going torpedo boat should not be less than 125 feet long. As boats below this length are too small to keep the sea

for any length of time they must operate from a base of supplies, and this limits them practically to coast defense. The services required of the larger boats, however, are of two kinds: they must be able to make torpedo attacks upon the enemies' vessels and able to protect their own fleet against similar attacks. As has been said before, the construction of one type of vessel with marked characteristics is an incentive to the development of another type to destroy her. Just as the armored cruiser was evolved to destroy the swift protected cruiser so has the torpedo boat destroyer, commonly called the "destroyer," been evolved to meet and destroy the largest and fastest torpedo boats. Of larger size and therefore more seaworthy, with a stronger armament and greater coal capacity and speed, and therefore the superior of the torpedo boat in every respect, with the same outfit of torpedoes as the boat and therefore just as dangerous to an enemy, the destroyer promises to drive out the torpedo boat type for everything except harbor defense, just as the armored cruiser shows signs of driving out the protected cruiser type. A comparison of what may be considered standard torpedo boats of the three types is given in the following table:

	Harbor defense boat	Sea- going boat	De- stroyer
Length	99' 6"	138' 9"	248'
Beam	12' 6"	14' 3"	23' 3"
Draft	3' 3"	4' 11"	6' 0"
Displacement, tons	45.38	105	433
Speed: Knots per hour...	20.8	22.5	20.86
Indicated horse-power	850	1,720	8,300

It is usual for maneuvering purposes and as a precaution in case of accident, to make nearly all torpedo boats of the three types is given in the screw, though some foreign navies, noticeably the German, make many single-screw boats. As in most other types the tendency here is in the direction of too high speed. Most authorities agree that 25 knots is enough for a torpedo boat and 28 knots enough for a destroyer; this is speed sufficient for all practical purposes and the weight saved can be put into the main engines, which are of necessity extremely light and therefore liable to break down. The destroyer type is quite seaworthy and is capable of accompanying the fleet, provided means is at hand for replenishing the coal and store supply. This country has not gone into the construction of torpedo boats and destroyers as extensively as most of the other powers, as is shown in the following table:

	U. S.	Eng- land	France	Ger- many	Rus- sia
First class torpedo boats.	35	117	178	103	98
Destroyers	16	130	43	39	54

The detailed particulars of United States destroyers and torpedo boats are given in preceding tables.

The following table gives the total number of steel and iron steam vessels of the United States navy, with their displacement and indicated horse-power. It includes all steam vessels fit for service and those under construction 1 January 1904:

WART — WARTHE

Class	Number	Displacement	Indicated horsepower
First class battleships.....	24	317,850	349,594
Second class battleships...	1	6,770	8,610
Armored cruisers	10	128,513	220,170
Armored ram	1	2,155	5,068
Single turret monitor	4	12,800	10,006
Double turret monitor	6	26,089	16,570
Protected cruisers	23	110,705	237,775
Unprotected cruisers	3	6,281	16,258
Gunboats	12	16,010	26,456
Light draft gunboats.....	3	4,165	6,418
Composite gunboats	8	8,330	8,288
Special class	2	2,415	6,048
Gunboats under 500 tons...	21	4,301	3,592
Torpedo boat destroyers...	16	6,951	124,480
Torpedo boats	35	5,708	90,388
Submarine boats	8	939	1,114
Iron cruising vessels.....	5	6,441	1,675
Auxiliary cruisers	5	28,339	15,000
Converted yachts	23	1,188	21,058
Colliers	16	64,818	16,982
Hospital and supply ships.	14	50,983	14,779
Total	240	810,812	1,199,215

In conclusion it may be said that on the present basis of naval construction, by the year 1908 the United States will possess the second navy in the world, being exceeded only by that of Great Britain, and taking them ship by ship and class by class, ours are probably superior, as we have steadily pursued the policy of giving our ships relatively heavier batteries than foreign vessels of the same class. See also NAVAL ARCHITECTURE; NAVAL GUNS; TORPEDO BOATS.

WILLIAM FLOYD SICARD,
Bureau of Steam Navigation, U. S. Navy.

Wart, an elevation on the skin, usually a collection of lengthened papillæ, closely adherent, and ensheathed by a thick covering of hard dry cuticle. From friction and exposure to the air the surface presents a horny texture, and is rounded off into a small button-like shape. Simple warts are commonly seen on the hands and fingers (rarely on the face or elsewhere) of persons of all ages, but especially of children. Among other varieties of warts are: (1) the verruca digitata, more elongated in shape and less protected by cuticle than the common wart, and which is apt to occur on the scalp, especially in persons of adult age, and sometimes occasions great annoyance in brushing and combing the hair; (2) subungual warts, generally of syphilitic origin, growing, as their specific name implies, beneath or at the side of the finger or toe nail, and which originate beneath the nail, as they increase crop out either at the free extremity or the side of the nail, and are usually troublesome, often very painful; (3) venereal warts, caused by the direct irritation of the discharges of gonorrhœa or syphilis, and occurring about the parts which are liable to be polluted with such discharges. These last attain a larger size, and are more fleshy and vascular than other warts. It is supposed that warts are always due to some local irritation. Venereal

warts are certainly contagious; with regard to others, nothing can be said positively on this point. In consequence of the capricious way in which warts often undergo spontaneous cure, there are numerous popular "charms" for their removal. Common warts are so apt to disappear that they may be often left to themselves. If it is desired to remove them, glacial acetic acid may be applied with a camel's hair pencil till the wart is pretty well sodden, care being taken not to blister the neighboring skin. One or at most two applications will usually be sufficient. Nitrate of silver and tincture of iron are popular and general applications. Salicylic acid in collodion is also very effective. Small warts hanging by a neck may often be very simply removed by the tight application of an elastic ligature to the base. The wart usually shrivels up and falls off within a week. Electrocautery is sometimes successfully employed. The other varieties must be left to the surgeon.

Wart-hog, an extraordinary African swine, several species of which form the genus *Phacocharus*, and are so named from the presence of a large warty protuberance on each cheek. The *P. aliani* of Northern Africa is familiar in Abyssinia under the names of halluf or Haroja. Another species is the vlakke vark (*P. athiopicus*) of Dutch South Africa, which, like the preceding form, has formidable tusk-like canines and a large wart under each eye. The animal attains a length of 3 or 4 feet, and is reddish-gray with a stiff blackish mane and spinal stripe. It is fierce and courageous and fights desperately when brought to bay.

Warta, vār'tā. See WARTHE.

Wartburg (vārt'boorg) **Castle**, an ancient mountain castle of Germany, not far from Eisenach, belonging to the Grand Duke of Saxe-Weimar. It was built between 1069 and 1072, and was the residence of the landgraves of Thuringia. The elector Frederick the Wise of Saxony caused Luther, who had been outlawed by the Diet of Worms, to be carried thither, where he lived from 4 May 1521 to 6 March 1522, engaged in the translation of the Bible. See LUTHER, MARTIN.

Wartburg, **War of the**, the name given to a great poetic contest which took place in 1206 or 1207, when the minnesingers assembled at the Wartburg, Germany, for a trial of their skill before Hermann I., landgrave of Thuringia. The poem descriptive of the contest was entitled *Krieg von Hartburg*, and appeared about 1300. It is a singular, wild, and inharmonious composition, divided into two parts, and its authorship is unknown. The Wartburg festival was a celebration held at the castle by German students on 18 Oct. 1817, in the third centenary year of the Reformation. Several hundred students from 12 universities were present, and here the colors of the student societies were displayed for the first time. The participators in the festival were suspected of an intention of introducing republicanism into Germany, and after the assassination of Kotzebue a large number of them were arrested and imprisoned, and not long afterward all participation in the student societies was forbidden by the authorities.

Warthe, vār'tē, or **Warta**, a European river, the principal tributary of the Oder River. It rises near Kromolov, Russian Poland, and

WARWICK—WASECA

after a northern and western course, enters Prussia at the confluence of the Prosna. It flows into the Oder at Küstrin, where it is 640 feet wide, after a westerly course through the Prussian province of Posen. Its total length is 487 miles, of which 222 miles are in Prussia. A canal connects it with the Vistula.

Warwick, wŏr'ik. **Guy**. See **GUY OF WARWICK**.

Warwick, Richard Neville, **EARL OF**, English soldier and statesman, known as the "King-maker" b. about 1428; d. Barnet, Hertfordshire, 14 April 1471. In the battle of St. Albans (1455), the opening action of the Wars of the Roses, he fought on the Yorkist, the winning side, and three years later as lord-deputy of Calais and admiral of the fleet gained a splendid success over the Spaniards, but a quarrel between his followers and those of the king led to charges against him which resulted in his taking the field of Ludlow with his cousin, the Duke of York (1459). On being defeated, he withdrew to Calais, and thence in the following summer recrossed to Kent, and, mastering London, brought about the compromise by which Henry VI. was to reign for life, but York was to be recognized as his successor. Thereupon Margaret of Anjou, routing and slaying York and Salisbury at Wakefield, advanced to St. Albans, where a second battle ended in Warwick's defeat. Warwick, however, joined the young Earl of March (now Duke of York), and boldly placed him on the throne as Edward IV., then chasing the Lancastrians back to Yorkshire, cut them to pieces on the field of Towton 29 March 1461. Warwick, however, bestowed his daughter on the Duke of Clarence, and after seizing on Edward's person, executing the queen's father and brother, entered upon a scheme for making Clarence king.

Failure drove him once more to France, where, through the mediation of Louis XI., he engaged to restore the crown to Henry VI., with the understanding that Margaret wed her son to Warwick's daughter Anne. His landing in Devonshire came like a clap of thunder to Edward IV., who from the North, where he was busy quelling a revolt, escaped to Burgundy, leaving Warwick master of the kingdom. Edward returned in six months' time, and Warwick with his brother was routed and slain at Barnet 14 April 1471.

Warwick, England, a market-town, capital of Warwickshire, on the right bank of the Avon, 90 miles northwest of London. The principal buildings are the Church of St. Mary, the Earl of Leicester's hospital for aged brethren, the shire-hall, jail, museum, endowed grammar school, east and west gates, etc. The chief manufacture is gelatine; and the trade in cattle, corn, and provisions is considerable. On the opposite bank of the river, crowning a solid rock, is the ancient and magnificent castle, the residence of the earls of Warwick. The date of the original erection is unknown. Caesar's Tower, the most ancient part of the structure, is 147 feet high; Guy's Tower, 128 feet high, was erected in 1394. The approach to the grand front exhibits three stupendous towers, and the entrance is flanked with embattled walls covered with ivy. It was partially destroyed by fire in 1871; but the most ancient portion remains uninjured. Pop. (1901) 11,889.

Warwick, N. Y., village in Orange County; on the Wawayanda Creek, and on the Lehigh & Hudson River Railroad; about 30 miles southwest of Newburgh and 10 miles south of Goshen. It is in an agricultural region, and near by are iron mines and granite quarries. In the vicinity are the beautiful lakes, Glennere, Greenwood, Clark's, and Wawayanda. The manufacturing establishments are railroad shops, a foundry, creameries, and fabric-hose works. It has six churches, Warwick Institute, graded schools, and a school library. There are two banks; the national has a capital of \$100,000 and deposits \$267,920. The Warwick Savings bank has (Jan. 1903) deposits, \$1,044,130. The village is a favorite summer resort. Pop. (1890) 1,537; (1900) 1,735.

Warwick, R. I., town in Kent County; on the Pawtuxet and the Providence rivers, the Cowsett and Narragansett bays, and on the New York, New Haven & Hartford Railroad. It is 5 miles south of Providence. It has extensive manufacturing interests; the chief industrial establishments are cotton mills, flour and grist mills, foundry and machine shops, and blacksmith and wheelwright shops. The government census of 1900 gives the number of manufactories 104, which were capitalized for \$8,418,333, and which had 5,544 employees, who received annually \$1,852,462. The raw material cost, each year, \$2,522,789, and the products were valued at \$6,197,506. The town includes several villages, in each one of which there are graded schools, and in some libraries. Warwick was settled in 1642 by a colony of 12 Englishmen, under the leadership of Samuel Gorton. The place was first called Shawomet; but in 1848 the name was changed by admirers of the Earl of Warwick. Massachusetts claimed control of the colony, and in 1643 one result of the contentions was that the place was nearly destroyed. Indians attacked the place several times, and, in 1676, burned a number of houses and wounded many of the defenders of the town. Nathaniel Greene (q.v.) was born in Warwick. Pop. 1890) 17,761; (1900) 21,316; (1903) est. U. S. Census Department, 22,384.

Wasco (wäs'kō) **Indians** ("grass," or "grass people"), a tribe of the Chinookan stock of North American Indians, also known as Dalles Indians and as Wascopums. They formerly claimed the country about The Dalles, on the south bank of Columbia River, in Wasco County, Oregon, therefore forming, with the Wushum or Tlagluit, the easternmost extension of the Chinookan stock. They were participants in the Wasco treaty of 1855 and are now on Wamspring Reservation, Oregon. Pop. about 290.

Waseca, wā-sē'kə, Minn., city, county-seat of Waseca County; on Clear Lake, and on the Minneapolis & Saint Louis and the Chicago & Northwestern R.R.'s; about 60 miles south by west of Minneapolis and 25 miles south by east of Mankato. It is in an agricultural and stock-raising region. It has flour mills, creameries, and machine shops. The Minnesota Chautauqua holds its sessions on their grounds bordering on the lake, and adjoining the city. There are 12 churches, the Holy Child Jesus Academy, graded public schools, and a school library. Pop. (1890) 2,482; (1900) 3,103.

WASH — WASHBURN

Wash, England, a wide estuary on the east coast, between the counties of Lincoln and Norfolk, 22 miles in length and 15 miles in average breadth. It is surrounded by low and marshy shores, and receives the Witham, Welland, Ouse, Nen and Nar rivers. The estuary for the most part is occupied by sandbanks, dry at low water, and intersected by channels through which the rivers flow into the North Sea. On both sides of the channel by which the Ouse falls into the sea considerable tracts of land have been reclaimed. Anchorage is afforded to vessels by two wide spaces or pools of water, called respectively Lynn Deep, opposite the Norfolk, and Boston Deep, off the Lincoln coast.

Wash Bottle, in analytical chemistry, an apparatus used for delivering a fine jet or stream of liquid on to a precipitate for the purpose of washing it, or for removing any residue of a solution or solid particles from one vessel to another. It consists of a flask of hard glass, fitted with a cork or india-rubber stopper perforated in two places. Through each perforation is passed a piece of bent glass tubing, one being carried to within half an inch of the bottom of the flask, and the portion of tubing outside drawn to a fine open point. The other tube is carried just within the bottle, and it is to the outer end of this that the lips are applied in blowing into the apparatus in order to expel the liquid contained in it.

Washburn, wôsh'bérn, **Cadwallader Col-den**, American soldier, son of Israel Washburn (q.v.): b. Livermore, Maine, 22 April 1818; d. Eureka Springs, Ark., 14 May 1882. He studied law, was admitted to the bar in 1842, and engaged in practice at Mineral Point, Wis. He founded a bank there in 1852, dealt extensively in real estate, and in 1855-61 was a member of Congress. At the outbreak of the Civil War he organized a cavalry regiment, of which he was appointed colonel. He was engaged in the Arkansas campaign, received his commission as major-general of volunteers in 1862, participated in the movements around Vicksburg, and later was assigned to command the 13th Corps in the Department of the Gulf. He was transferred to Texas with a portion of his command in 1863, captured Fort Esperanza, 29 Nov. 1863, and in 1864 was placed in command of the district of West Tennessee. He was again member of Congress in 1867-71, was governor of Wisconsin in 1871-3, and subsequently engaged in lumber and flour manufacturing. He founded the Washburn Observatory at the University of Wisconsin.

Washburn, **Charles Ames**, son of Israel Washburn (1784-1876) (q.v.), American editor and diplomat: b. Livermore, Maine, 16 March 1822; d. New York 26 Jan. 1889. He was graduated at Bowdoin in 1848, went to California in 1850, entered journalism in San Francisco, and became editor and proprietor of the *Alta California*, the first newspaper on the Pacific coast to advocate the principles of the Republican party, of which he was one of the organizers in that State. From 1858 to 1861 he was editor and proprietor of the *San Francisco Daily Times*. In 1860 was chosen elector at large, and in the following year was appointed by President Lincoln minister to Paraguay, a post which he occupied for seven years, covering most of the

period of the war between that country and Brazil and her allies. In 1868, under the tyranny of Francisco Solano Lopez (q.v.) many foreigners, as well as Paraguayans, were put to death on an unfounded charge of conspiracy against the government, and Washburn, on account of his efforts to save the lives of his associates, was accused of complicity in the plot. His life was preserved through the intervention of a United States naval force, the gunboat *Wasp* taking him away from the country. Disagreement with certain naval officers grew out of these incidents, and the circumstances were investigated by the House Committee on Foreign Affairs. The result was Washburn's complete vindication. He published a 'History of Paraguay, with Notes of Personal Observations and Reminiscences of Diplomacy under Difficulties' (1871), giving a graphic account of these events; 'From Poverty to Competence'; 'Graduated Taxation'; 'Political Evolution'; and several novels. He was the inventor of a typograph and other mechanical devices.

Washburn, **Emory**, American jurist: b. Leicester, Mass., 14 Feb. 1800; d. Cambridge, Mass., 17 March 1877. He entered Dartmouth College, and from there went to Williams, where he was graduated in 1817. Admitted to the bar in 1821, he practised in Leicester until 1828, and for the next 30 years in Worcester. Having served in both branches of the Massachusetts legislature, in 1844 he became a justice of the court of common pleas, a position which he held three years. In 1854-5 he was governor of the State. From 1856 to 1876 he served as Bussey professor in the Harvard Law School. Besides lectures, pamphlets, etc., his legal publications include 'American Law of Real Property' (1860); and 'American Law of Easements and Servitudes' (1863).

Washburn, **George**, American educator: b. Middleboro, Mass., 1 March 1833. He was graduated from Amherst in 1855 and from Andover Theological Seminary in 1859. He was appointed professor of philosophy at Robert College, Constantinople, Turkey, in 1868; served as acting president there in 1870-7; and since the last named year has been president of the college. He is an authority on the politics of Southeastern Europe and in recognition of his services in behalf of Bulgarian liberty and the general elevation of the people he received from the first Bulgarian Parliament a vote of thanks, and in 1884 from the Prince of Bulgaria, the Order of Saint Alexander. He delivered an address on Mohammedism at the World's Parliament on Religions at Chicago in 1893, has been for 20 years a contributor to the London 'Contemporary Review,' and also to other English and American periodicals.

Washburn, **Israel**, American shipbuilder and trader: b. Raynham, Mass., 18 Nov. 1784; d. Livermore, Maine, 1 Sept. 1876. In 1806 he removed to Maine, then a part of Massachusetts, and having a population of about 200,000. Two years later at a place then called White's Landing (now Richmond), on the Kennebec River, he began shipbuilding in partnership with Barzillai White, and in 1809 established a trading-post at Livermore (now in Androscoggin County), where he soon after settled. He reared many children and several of

WASHBURN — WASHBURN COLLEGE

his sons rose to positions of distinction, making the family name conspicuous in American history.

Washburn, Israel, Jr., American lawyer and "War Governor," son of the preceding: b. Livermore, Maine, 6 June 1813; d. Philadelphia 12 May 1883. He studied law, was admitted to the bar in 1834, and in the same year settled at Orono, Maine, where he practised his profession continuously until 1850, when he was elected to Congress. He was four times re-elected, and became prominent among the anti-slavery members of the House in the critical period just before the Civil War. In 1860 he was elected governor of Maine. Re-elected in 1861, he declined a third election, and in 1863 accepted an appointment as collector of customs for the port of Portland, an office which he continued to hold until 1877. During his terms as governor he energetically supported the Federal government by raising, equipping and forwarding troops with a promptness which insured to Maine an honorable position among the States that upheld the Union cause, and placed his own name in the list of great "War Governors" of the period. In 1875 he was elected to the presidency of Tufts College, but declined the office. He published 'Notes, Historical, Descriptive, and Personal, of Livermore, Maine' (1874), and also contributed frequently to periodicals.

Washburn, Samuel Benjamin, American naval officer, son of Israel Washburn (1784-1876) (q.v.): b. Livermore, Maine, 1 Jan. 1824. He became a shipmaster in the merchant marine, and later engaged in the lumber trade in Wisconsin. During the Civil War he entered the United States naval service as a volunteer, and at the battle of Fort Darling won special commendation for skill and gallantry. Later he commanded a squadron and performed many valuable services for the government.

Washburn, William Drew, American legislator and manufacturer, son of Israel Washburn (q.v.): b. Livermore, Maine, 14 July 1831. He was graduated at Bowdoin in 1854, admitted to the bar in 1857, and in that year engaged in law practice in Minnesota. He was a member of the Minnesota legislature in 1859 and in 1871; was surveyor-general in 1861-5; served in Congress in 1879-85; and in 1889-95 was a United States senator. He engaged extensively in the lumber and flour industries, was one of the builders of the Minneapolis and Saint Louis railroad, of which he was president until 1889, and he is now (1904) president of the Bismarck, Washburn and Great Falls Railroad Company.

Washburn, Maine, town in Aroostook County; on the Aroostook River; 50 miles north by west of Houlton. It is a distributing centre of considerable importance, although it is eight miles from a railroad station. It is a favorite summer resort. It has three churches, a high school, graded school, and public library. Pop. (1890) 1,097; (1900) 1,225.

Washburn, Wis., city, county-seat of Bay-field County; on Lake Superior, and on the Northern Pacific and the Chicago, St. P., M. & O. R.R.'s; about 50 miles east of Superior, and 200 miles northeast of Minneapolis, Minn. In 1665 a Jesuit mission was established in the place now occupied by the city. Washburn's

first permanent settlement was made in 1883, and in 1884 it was incorporated. In the vicinity are brownstone quarries, and in the forests there is considerable lumbering. There are nearly 2,000 employees in the industrial establishments. Washburn ships large quantities of stone, lumber, and grain; and distributes to the lumber camps and the towns and hamlets of the vicinity general merchandise. There are several church buildings, the county court-house, which cost \$50,000, and several good business blocks. The educational institutions are the Walker High School, founded in 1889 (building cost \$40,000), three graded schools, one large Roman Catholic parish school, and a school library. The two banks have a combined capital of \$50,000. The majority of the inhabitants are Scandinavians. Pop. (1890) 3,699; (1900) 6,814.

Washburn College, located at Topeka, Kan. It was founded in 1865 by the General Association of the Congregationalists of Kansas, but is non-sectarian in policy and government. It was first called Lincoln College, and the name changed in honor of Ichabod Washburn of Worcester, Mass., who gave the college \$25,000. The college is co-educational. The course of study was at first not above the academic grade, but was soon expanded to a full college course, and other departments added until the college now includes five departments: (1) the College; (2) the School of Medicine, founded as the Kansas Medical College in 1890 and made a department of Washburn in 1902; (3) the School of Law, opened in 1903; (4) the School of Fine Arts; (5) the Washburn Academy. The college confers the degrees of B.A. and B.S. for the completion of a four years' course, and the degrees of M.A. and M.S. for graduate work. For the bachelor degrees the course in the first two years is partially prescribed and partially elective, for the last two years entirely elective; the electives for the Junior and Senior years are divided into three groups, (1) language and literature, (2) mathematics and science, (3) history, philosophy, and social science. One of these groups must be elected as a major department, candidates for the B.S. degree must elect the mathematic and science group. Biblical literature, Hebrew, and pedagogical courses are included in the curriculum. The School of Medicine offers a four years' course leading to the degree of M.D., it is the only school in the State associated with the American Association of Medical Colleges. The School of Law offers a three years' course and confers the degree of LL.B. The School of Fine Arts was organized as a separate school in 1902, music and art departments having been established some years before. This school includes the departments of music, drawing, and painting (including the Reid-Stone School of Art), and oratory. The music department offers four years' collegiate courses in pianoforte, organ, violin, and vocal culture, leading to the degree of bachelor of music; and a two year normal course for public school teachers; there are also four years' courses in drawing and painting leading to the degree of bachelor of painting, and in oratory leading to the degree of bachelor of oratory. The students maintain four literary societies, two for men

WASHBURNE — WASHINGTON

and two for women, an oratorical association, Christian associations, and an athletic association. In addition to the intercollegiate sports in which the college participates, an annual college field-day has been inaugurated. The college occupies a campus of 160 acres just outside the city on elevated ground; the buildings include Rice Hall (originally Science Hall, the name being changed in 1902), Whitin Hall, the observatory building (erected in 1903 for the departments of physics and astronomy), the MacVicar chapel, the Boswell Memorial Library, Hartford Cottage and Holbrook Hall (women's dormitories). In 1904 a new library building, the gift of Andrew Carnegie, was in process of construction. The library in 1904 contained 12,000 volumes; in addition the schools of law and medicine have separate libraries; and the Topeka Public, the Kansas State, the Kansas State Historical Society, and the Academy of Science libraries are open to students. In 1904 the students numbered 617, of whom 222 were in the college, 212 in the School of Fine Arts, and 102 in the School of Medicine.

Washburne, Elihu Benjamin, American diplomat, son of Israel Washburn (q.v.): b. Livermore, Maine, 23 Sept. 1816; d. Chicago, Ill., 22 Oct. 1887. He was educated at Harvard, admitted to the bar in 1840, and engaged in practice at Galena, Ill. He was a member of Congress from 1852-60, when he was appointed secretary of state by President Grant, an office he soon afterward resigned in order to become minister plenipotentiary to France. He was the only foreign minister to remain at his post in Paris throughout the Franco-Prussian war, and the American legation became a refuge for Germans and other foreigners unable to leave the city during the siege of the city and the period of the Commune. His firmness in his course won the gratitude of the European governments and he was granted special honors by the German emperor and Bismarck, as well as by the French leaders, Gambetta and Thiers. He returned home in 1880. He published 'Recollections of a Minister to France' (1887).

Washing of Feet. See FEET WASHING.

Washing Machine, a machine for washing clothes. A great number of machines have been contrived, the most general feature of them being that the clothes are agitated by artificial means in a vessel or trough containing the cleansing agents. One of the great advantages of the washing-machine as compared with the hands is, that the water can be used when boiling hot. In some, provision is made for retaining the steam, which effectually bleaches the clothes, and they generally have also roller attachments for wringing and mangling.

Washington, wōsh'ing-tōn, Booker Taliaferro, American negro educator: b. near Hale's Ford, Franklin County, Va., about 1858. After the Civil War he went to Malden, W. Va., where he worked first in a salt-furnace and afterward in a coal-mine, obtained some rudiments of education in a night-school there, and finally after many difficulties, recounted in the autobiography 'Up from Slavery' (1901), got to the Hampton Normal and Agricultural Institute (Va.) (q.v.), where he studied in 1872-5. After a two-years' interval of teaching at Malden, he obtained further training at

the Wayland Seminary (Washington, D. C.), and in 1879 was made an instructor at Hampton. He had charge of the work of the Indian pupils then being experimentally introduced into the institution, and established the night-school as a regular and successful feature of the institute. In 1881 he was selected by General S. C. Armstrong of Hampton on the application of citizens of Tuskegee, Ala., to start in that place an institution on the plan of Hampton. The State legislature granted an appropriation of \$2,000 annually for the salaries of the teaching force, but the Tuskegee Normal and Industrial Institute (q.v.) then existed in name only, without land, buildings, or credit. Washington, with himself as the only instructor, opened the school with an enrollment of 30 in an old church and a shanty. Later he purchased a plantation about a mile from Tuskegee, and removed the school thither to its present site. In 1902 the institution had 112 officers and instructors, 1,384 students, and an income of \$341,000. Its development was due chiefly to the activity of Washington in bringing the nature and merits of the work to public attention, and the originality and effectiveness of his methods. He has aimed to give the blacks a practical education along lines of trade and industry, leading to an ultimate position of economic independence in the South. If this were attained, he asserted, political rights now denied would not long be withheld. He became well known as a forceful public speaker, his most noteworthy address probably being that given in 1895 at the opening of the Cotton States and International Exposition in Atlanta, Ga. He organized the National Negro Business League at Boston in 1900. Among his writings are: 'The Future of the American Negro' (1899); 'Up from Slavery' (1901), the interesting autobiographical narrative referred to above; and 'Character-Building' (1902), collected addresses to pupils of Tuskegee. Consult further M. B. Thrasher, 'Tuskegee' (1900), to which Washington contributes an introduction; and an article by W. D. Howells in the 'North American Review,' Vol. 173, pp. 280-8 (1901).

Washington, Bushrod, American jurist: b. Westmoreland County, Va., 5 June 1762; d. Philadelphia 26 Nov. 1829. He was nephew of George Washington. Graduated in 1778 from the College of William and Mary; he studied law with James Wilson (1742-98) (q.v.) at Philadelphia, and practised in Westmoreland County with much success. From 1780 until the surrender at Yorktown, he served in Colonel Mercer's cavalry troop; in 1787 became a member of the Virginia house of delegates; and in 1788 of the Virginia convention for ratification of the Constitution of the United States. In December 1798 he was appointed an associate justice of the United States Supreme Court. He was the first president of the American Colonization Society. (See COLONIZATION SOCIETY OF AMERICA, THE NATIONAL.) Among his publications are: 'Reports of Cases in the Court of Appeals of Virginia' (1708-9); 'Reports of Cases Determined in the Circuit Court of the United States for the 3d Circuit, 1803-27' (edited by R. Peters, 1826-9). Consult Binney, 'Life' (1858).

Washington, George, American soldier-statesman, and first President of the United

WASHINGTON

States: b. 22 Feb. 1732 in the family homestead at Bridges Creek, in Westmoreland County, Va. He was the fifth child of Augustine Washington, who belonged to the third generation of Washingtons who had lived in America. Augustine was a well-do-do planter who might have afforded every school advantage to his son had he not died before George was 12 years of age. The father's death left the son in his mother's care, with a farm on the Rappahannock as his sole inheritance. This precluded any hope of an education in England such as his elder brothers had enjoyed, and he, therefore, received the practical and elementary instruction afforded in colonial Virginia. He learned something in books but more about the forest life, and manly sports, and the habits of a Virginia gentleman. Formal schooling he quit altogether at the age of 16, and began surveying in the employment of Lord Fairfax, an Englishman who came to Virginia to look after his inherited lands, and whose companionship taught Washington some of the conduct and breeding of a man of the world. Though Washington was a mere boy and almost self-taught in surveying, yet he was a good woodsman, and he did his work so well on Lord Fairfax's forest lands that for three years he was kept busy at the profession, which in that day approached nearer to woodcraft than expert mathematics. Meanwhile he did not neglect to give considerable time to the study of military tactics and the manual of arms, for which a Virginian of his standing might have use. This life came to an end in 1751, when the failing health of his elder brother Lawrence caused him to seek recuperation in the Bahamas. Thither George went with him, only to bring him back to die. As executor of his brother's will, he assumed so many cares that his surveying profession had to be abandoned altogether.

Before Lawrence's death he had given George his place in the Virginia militia, and in 1752 Lieut. Gov. Dinwiddie gave the popular young soldier a commission as major and adjutant-general in charge of one of the four military districts of the State. Hardly was he in charge of his new office when a movement of the French to insure their control of the region between the Mississippi and the Alleghanies made war between the French and English in America almost inevitable. From Canada the French had sent 1,500 men to Presque Isle on Lake Erie to erect a fort, intending thence to push through the forest to the Allegheny River and down it to the Ohio. There they would drive out the English, who were beginning to push into that region.

Gov. Dinwiddie saw the danger and, after getting authorization from England, he selected Maj. Washington for a dangerous midwinter journey through the forest to the French fort, to command them to depart and not to trespass upon England's claims. The hardy young surveyor made the terrible journey only to be given the hint that the French had come to stay. Upon his return, the Virginia assembly was persuaded to furnish funds for a force to be sent against the invaders. Washington was made lieutenant colonel, and under Col. Fry set out to resist the French advance. Fry died on the march, and Washington bore the brunt of the enterprise. A rough and ready fort built

by an advance party of backwoodsmen near the junction of the Ohio and the Allegheny was taken by the French, who thereupon built Fort Duquesne and awaited the Virginians. In that neighborhood, at Great Meadows, Washington camped. A skirmish took place in which a small body of French under Jumonville were defeated, and then the defenses, which Washington had built and called Fort Necessity, were attacked, 3 July 1754, by superior French forces. A wretched day of fighting in the rain was followed by a parley, at which Washington sensibly agreed to withdraw from a hopeless conflict. Upon his return to Virginia he was unfairly reduced in rank, and indignantly resigned his commission.

The war for the possession of America was now taken up by the home government. England sent the headstrong Gen. Braddock to help the English colonists to drive out the French. Upon his arrival in Virginia he made the acquaintance of Washington and offered to make him a member of his staff—an offer which was eagerly accepted. Braddock did not realize the difficulties of forest warfare, and without heeding some of the wise counsel given him by Americans, he pushed toward Fort Duquesne with 2,000 regulars brought from England and some provincial recruits. Eight miles from the French fort, he was attacked by an unseen enemy, and the terrified regulars were held in solid ranks to be shot down until sheer fright made them break into retreat. Braddock was mortally wounded, and it was left to Washington to conduct the retreat. After he had led the shattered forces back to Virginia, he became for a time the chief stay of his province in guarding her frontiers against the savages, until, in 1758, he was sent with the British General Forbes again to attempt the capture of Fort Duquesne, and this time success crowned the effort. Then Quebec fell, and England's power in America was firmly established.

When England and her colonies quarreled, Washington took an early and decided part in asserting and defending the colonial rights, though with other American leaders he long looked and hoped for conciliation. To him the Stamp Act was "a direful attack on the liberties of the colonists." In 1769 he thought something must be done "to maintain the liberty which we have derived from our ancestors." He approved of awakening English attention to American rights "by starving their trade and manufactures," and as a member of the Virginia assembly he presented a non-importation agreement, and secured its passage. He was present and gave his support, in 1773, to the resolves instituting a committee of correspondence, and in 1774 he favored the proposed general congress at Philadelphia. On 1 Aug. 1774 the convention met which elected him, with six others, delegates to the first Continental Congress, where he was in the opinion of Patrick Henry "unquestionably the greatest man on the floor," as far as solid information and sound judgment were concerned. When the second Continental Congress met, 10 May 1775, he was again a member, but he was not long to remain there.

After 10 long years of growing irritation between England and America the first blow had been struck. The enraged farmers had followed the intruding British from Concord and

WASHINGTON

Lexington to the very defenses of Boston, and then with their numbers ever-increasing they settled down in a great half-circle around the town with the purpose of driving Gage, the British commander, into his ships. Everything was in confusion and men came and went much as they chose, kept to their task only by the efforts of a few natural leaders. When the men of New Hampshire and Rhode Island and Connecticut came, not even the fanatic zeal of the siege could banish the provincial jealousies. It was plain to all that there could be no great thing accomplished without a strong leader, one who would make men forget, for a time at least, the most prominent fact in colonial life—the jealous love that every man had for his own colony.

The Continental Congress was forced after a month of hesitation to assume the army before Boston as the "Continental Army." As a commander-in-chief they needed a man who could by his personal influence draw the southern and middle colonies into the struggle which New England had thus far made alone. In this critical moment John Adams saw the wisdom of binding the South to New England's fortunes by choosing a Virginian to lead her army. Local prejudice would have chosen John Hancock, who was bitterly chagrined that he missed the office. At Adams' suggestion the choice fell upon Col. George Washington, who every day since the session began had sat in Congress in his uniform.

The new commander-in-chief was a physical giant, over six feet, and of well-proportioned weight. His composed and dignified manner, and his majestic walk marked him an aristocrat and a masterful man. This character was heightened by a well-shaped, though not large, head set on a superb neck. His blue-gray eyes, though penetrating, were heavy-browed and widely separated, suggesting a slow and sure mind rather than wit, and brilliant imagination. Passion and patience, nicely balanced, appeared in the regular, placid features, with the face muscles under perfect control. A resolutely closed mouth and a firm chin told of the perfect moral and physical courage. His clear, pale, and colorless skin never flushed in the greatest emotion, though his face then became flexible and expressive. Mentally, the directive faculties were the more marked. He had been but half-educated, with no culture except that coming of good companionship. From that he had learned rather the tastes of a country gentleman, courtesy, hospitality, and a love of sport. The soundness of his judgment and the solidity of his information were the notable qualities. He had little legal learning and was too shy and diffident for effective speech. His eloquence was the eloquence of battle. It had the note of challenge, and the gesture of chivalry when it threw down the gage of mortal combat. "I will raise one thousand men," he said in 1775, "at my own expense, and march myself at their head for the relief of Boston." Of original statesmanship he had little, but he had "common sense lifted to the level of genius." Believing in a course, he followed it, single-minded, just, firm, and patient. No rash action or personal caprice was ever charged to him. He was able to bear great responsibility, and courageously to meet unpopularity and misrepresentation. There was no flaw in his devotion. He was

"often anxious, but never despondent." "Defeat is only a reason for exertion," he wrote. "We shall do better next time." This spirit, and his gift for military administration, were the winning traits in the years to come.

On the day before the Continental army fought at Bunker Hill, 16 June 1775, Washington accepted the command in his modest way, refusing to accept any pay for his services, except his actual expenses. To his wife, the one person to whom he would lay bare his heart, he wrote: "I assure you in the most solemn manner that so far from seeking this appointment, I have used every endeavor in my power to avoid it . . . from a consciousness of its being a trust too great for my capacity." "A kind of destiny" had thrown him into this service, and he could not refuse.

Upon his arrival at Boston, 2 July, Washington found his army an armed mob. They had done creditable things, but in a blundering, unmilitary way. Rude lines of fortifications extended around Boston, but they were executed with crude tools and without competent engineers. A few officers were looking after the commissary department, but there was no head. No able officer looked after the recruiting and mustering service, or the barracks or hospital, and there was only a haphazard method of paying the soldiers. There was no uniform, and the very differences in costume augmented the colonial jealousies and self-consciousness. All that distinguishes a well-drilled and equipped army from a mob was wanting; yet here was the weapon with which Washington was expected to defeat the armies of the most powerful nation of the world. Only by the exercise of all his gifts as an administrator did he get even the semblance of an army. His own great care for details, his method and punctuality had their effect upon others, and, though there was malingering, desertion, and petty mutinies, the enemy never knew that the army before Boston was often on the point of dissolution. When, in December, the terms of enlistment ran out, Washington even succeeded, as he said, in disbanding one army and raising another within cannon shot of the enemy. Then early in March 1776 he made an adroit move, seized Dorchester Heights, and left the British nothing to do but evacuate Boston in the utmost haste.
